

A collage of images illustrating the evolution of libraries. It includes historical grand libraries, modern digital libraries, children reading, hands typing on a keyboard, a person using a laptop, and a network diagram, symbolizing the transition from traditional to digital knowledge storage and access.

Encyclopedia of Library and Information Sciences, Fourth Edition

Contents

Volume I

Academic Libraries / <i>Susan Curzon and Jennie Quiñónez-Skinner</i>	1
Accessibility / <i>Lori Bell</i>	14
Accreditation of Library and Information Studies Programs in the United States and Canada / <i>Karen Lynn O'Brien</i>	18
Acquisitions Institute at Timberline Lodge / <i>Scott A. Smith</i>	22
African Librarianship / <i>Natalia T. Bowdoin and Janet Lee</i>	33
Altmetrics / <i>Richard Cave</i>	44
American Association of Law Libraries (AALL) / <i>Kate Hagan</i>	48
American Association of Museums (AAM) / <i>Elizabeth E. Merritt</i>	56
American Association of School Librarians (AASL) / <i>Donald C. Adcock</i>	59
American Library Association (ALA) / <i>Mary W. Ghikas</i>	67
American Medical Informatics Association (AMIA) / <i>Don E. Detmer, Tia Abner and Karen Greenwood</i>	85
American National Standards Institute (ANSI) / <i>Jana Zabinski</i>	87
American Society for Information Science and Technology (ASIST) / <i>Charles H. Davis and Debora Shaw</i>	90
Approval Plans / <i>Robert Nardini</i>	96
Arab Federation for Libraries and Information (AFLI) / <i>Nour Soufi</i>	100
Archival Appraisal and Acquisition / <i>Barbara Reed</i>	105
Archival Arrangement and Description / <i>Joanne Evans, Sue McKemmish and Barbara Reed</i>	115
Archival Documentation / <i>Gavan McCarthy and Joanne Evans</i>	127
Archival Finding Aids / <i>Su Kim Chung and Karla Irwin</i>	133
Archival Management and Administration / <i>Michael J. Kurtz</i>	141
Archival Reference and Access / <i>Mary Jo Pugh</i>	149
Archival Science / <i>Elizabeth Shepherd</i>	166
Archives / <i>Adrian Cunningham</i>	179
Archivists and Collecting / <i>Richard J. Cox</i>	195
Area and Interdisciplinary Studies Literatures and Their Users / <i>Lynn Westbrook</i>	209
ARMA International, Inc. / <i>Carol E. B. Choksy</i>	221
Armenia: Libraries, Archives, and Museums / <i>Sylva Natalie Manoogian</i>	228
Art Galleries / <i>Daniel C. Danzig</i>	241
Art Librarianship / <i>Kathryn M. Wayne</i>	249
Art Museums / <i>David Gordon</i>	259

Volume I (*cont'd.*)

Artificial Intelligence / Jianhua Chen	269
Artificial Neural Networks and Natural Language Processing / Hermann Moisl	279
Arts Literatures and Their Users / Lisl Zach	293
ASLIB / David Bawden and Lyn Robinson	301
Association for Information Science and Technology / Diane H. Sonnenwald, Charles H. Davis and Debora Shaw	311
Association for Information Systems (AIS) / William R. King and Dennis Galletta	318
Association for Library Collections and Technical Services / Charles Wilt	324
Association for Library Service to Children (ALSC) / Virginia A. Walter	333
Association of College and Research Libraries (ACRL) / Mary Ellen Davis and Mary Jane Petrowski	338
Association of Library Trustees, Advocates, Friends and Foundations (ALTAFF) / Sally Gardner Reed	361
Association of Research Libraries (ARL) / Lee Anne George and Julia Blixrud	364
Association of Specialized and Cooperative Library Agencies (ASCLA) / Barbara A. Macikas	376
Australia: Libraries, Archives, and Museums / Alex Byrne	379
Australian Library and Information Association (ALIA) / Sue Hutley, Jane Hardy and Judy Brooker	396
Authentication and Authorization / David Millman	401
Automated Acquisitions / Patricia A. Smith and Allison V. Level	408
Automatic Abstracting and Summarization / Daniel Marcu	418
Automatic Discourse Generation / John A. Bateman	430
Back-of-the-Book Indexing / Nancy C. Mulvany	440
Bibliographic Control [ELIS Classic] / Robert L. Maxwell	447
Bibliographical Society (London) / Julian Roberts	456
Bibliographical Society of America (BSA) / Hope Mayo	463
Bibliography / D. W. Krummel	468
Bibliometric Overview of Information Science / Howard D. White	480
Bibliometric Research: History [ELIS Classic] / Dorothy H. Hertz	492
Bibliothèque Nationale de France / Noémie Lesquins	531
Binding [ELIS Classic] / Lawrence S. Thompson	538
Biological Information and Its Users / Kalpana Shankar	554
Blind and Physically Disabled: Library Services / Jane Rosetta Virginia Caulton and Stephen Prine	563
Bliss Bibliographic Classification First Edition [ELIS Classic] / Jack Mills	573
Bliss Bibliographic Classification Second Edition / Vanda Broughton	581
Boolean Algebras [ELIS Classic] / A. R. Bednarek	591
Brazil: Library Science / Mariza Russo	597
Brazil: Library Science—Distance Education / Mariza Russo	603
Brazil: Museums / Regina Dantas and Pamela Howard-Reguindin	611
British Library / Andy Stephens	616
Business Informatics / Markus Helfert	630
Business Information and Its Users / Eileen G. Abels	635
Business Literature: History [ELIS Classic] / Edwin T. Coman, Jr.	643
Canada: Libraries and Archives / Ian E. Wilson and Sean F. Berrigan	654
Canadian Heritage Information Network (CHIN) / Shannon Ross and Paul M. Lima	675
Canadian Library Association (CLA) / Donald I. Butcher	681
Careers and Education in Archives and Records Management / Karen Anderson	685
Careers and Education in Information Systems / Paul Gray and Lorne Olfman	693

Volume I (*cont'd.*)

Careers and Education in Library and Information Science / <i>Jana Varlejs</i>	706
Careers and Education in Records and Information Management / <i>Carol E. B. Choksy</i>	715

Volume II

Cataloging / <i>Daniel N. Joudrey</i>	723
Cataloging Cultural Objects (CCO) / <i>Elizabeth O'Keefe and Maria Oldal</i>	733
Catalogs and Cataloging: History [<i>ELIS Classic</i>] / <i>Eugene R. Hanson and Jay E. Daily</i>	743
Censorship and Content Regulation of the Internet / <i>Peng Hwa Ang</i>	780
Center for Research Libraries / <i>Mary I. Wilke</i>	789
Charleston Conference / <i>Katina Strauch</i>	794
Chartered Institute of Library and Information Professionals (CILIP) / <i>Tim Owen</i>	806
Chemistry Literature and Its Users [<i>ELIS Classic</i>] / <i>Judith N. Currano</i>	814
Chemoinformatics / <i>Peter Willett</i>	830
Children and Information Technology / <i>June Abbas</i>	839
Children's Literature / <i>Judith V. Lechner</i>	852
Children's Services in Libraries / <i>Virginia A. Walter and Melissa Gross</i>	876
China: Libraries, Archives, and Museums / <i>Priscilla C. Yu and TzeHuey Chiou-Peng</i>	886
Circulation Services / <i>Vanessa Irvin and Jeff E. Bullard</i>	916
Citation Analysis / <i>Howard D. White</i>	923
Citation Indexes and the <i>Web of Science</i> / <i>Marie E. McVeigh</i>	940
Citer Motivations [<i>ELIS Classic</i>] / <i>Terrence Brooks</i>	951
Classification Theory / <i>Clare Beghtol</i>	958
Clinical Decision-Support Systems / <i>Kai Zheng</i>	974
College Libraries / <i>Thomas G. Kirk, Jr.</i>	983
Communication and Communication Studies / <i>Brenda Dervin and CarrieLynn D. Reinhard</i>	994
Communication Policy: United States / <i>D. Linda Garcia</i>	1007
Community Informatics / <i>Kate Williams and Joan C. Durrance</i>	1027
Complexity and Self-Organization / <i>Francis Heylighen</i>	1034
Computer-Mediated Communication (CMC) / <i>Michael A. Chilton and Roger McHaney</i>	1044
Computer-Supported Cooperative Work (CSCW) / <i>Kevin L. Mills</i>	1053
Conservation and Preservation of Museum Objects / <i>Ellen Pearlstein</i>	1068
Controlled Vocabularies for Art, Architecture, and Material Culture / <i>Murtha Baca</i>	1076
Corporate Archives / <i>Philip Mooney</i>	1081
Corporate Art Collections / <i>Laura Matzer</i>	1086
Corporate Information Centers / <i>Barbara M. Spiegelman and Nancy Flury Carlson</i>	1094
Corporate Records Management / <i>Barbara M. Cross and Barbara E. Nye</i>	1104
Credibility and Cognitive Authority of Information / <i>Soo Young Rieh</i>	1113
Croatia: Libraries, Archives, and Museums / <i>Aleksandra Horvat, Josip Kolanović and Visnja Zgaga</i>	1121
CrossRef Publisher Linking Network / <i>Amy E. Brand</i>	1132
Cultural Memory / <i>Robert DeHart</i>	1139
Curating Archaeological Artifacts / <i>Alex W. Barker</i>	1147
Curating Natural History Collections / <i>Kimberly S. Bostwick</i>	1156
Custody and Chain of Custody / <i>Bernadette G. Callery</i>	1164
Data and Data Quality / <i>Thomas C. Redman and Christopher Fox and Anany Levitin</i>	1171
Deaf and Hearing Impaired: Communication in Service Contexts [<i>ELIS Classic</i>] / <i>Warren R. Goldmann</i>	1183

Volume II (*cont'd.*)

Decision Sciences / <i>Sven Axsäter and Johan Marklund</i>	1192
Decision Support Systems / <i>Marek J. Druzdzel and Roger R. Flynn</i>	1200
Demand-Driven Acquisition/Patron-Driven Acquisition / <i>Michael Levine-Clark</i>	1209
Denmark: Libraries, Archives, and Museums / <i>Jens Thorhauge, Jakob Heide Petersen and Ole Magnus Mølbak Andersen</i>	1215
Descriptive Cataloging Principles / <i>Elena Escolano Rodríguez</i>	1229
Design Science in the Information Sciences / <i>Judith Weedman</i>	1242
Dewey Decimal Classification (DDC) / <i>Joan S. Mitchell and Diane Vizine-Goetz</i>	1256
Digital Content Licensing / <i>Paul D. Callister and Kathleen Hall</i>	1267
Digital Divide and Inclusion / <i>Mark Warschauer and Melissa Niiya</i>	1279
Digital Humanities / <i>Julia Flanders and Elli Mylonas</i>	1286
Digital Humanities and Academic Libraries / <i>Bobby Smiley and Michael Rodriguez</i>	1298
Digital Images / <i>Melissa Terras</i>	1307
Digital Millennium Copyright Act of 1998 / <i>Jonathan A. Franklin</i>	1316
Digital Object Identifier (DOI®) System / <i>Norman Paskin</i>	1325
Digital Preservation / <i>Jacob Nadal</i>	1332
Diplomatics / <i>Luciana Duranti</i>	1338
Disaster Planning and Recovery for Cultural Institutions / <i>Sheryl Davis, A. Patricia Smith-Hunt and Kristen Kern</i>	1347
Document Information Systems / <i>K. van der Meer</i>	1360
Document Theory / <i>Niels Windfeld Lund and Roswitha Skare</i>	1372
Document Type Definition (DTD) / <i>Judith Wusteman</i>	1381
Dublin Core Metadata Initiative (DCMI): A Personal History / <i>Stuart L. Weibel</i>	1390
Economics Literature: History [ELIS Classic] / <i>Arthur H. Cole and Laurence J. Kipp</i>	1399
Electronic Records Preservation / <i>Robert P. Spindler</i>	1413
Electronic Resources & Libraries (ER&L) / <i>Jesse Koennecke</i>	1419
Encoded Archival Description / <i>Daniel Pitti and Michael Rush</i>	1423
Engineering Literatures and Their Users [ELIS Classic] / <i>Thomas E. Pinelli, Ann P. Bishop, Rebecca O. Barclay and John M. Kennedy</i>	1433

Volume III

Epistemology / <i>Paul K. Moser</i>	1455
Ethical and Legal Aspects of Archival Services / <i>Sara S. Hodson</i>	1463
Ethical Aspects of Library and Information Science / <i>Richard Rubin and Thomas J. Froehlich</i>	1469
Ethical Issues in Information Systems / <i>Vladimir Zwass</i>	1484
Ethiopia: Libraries, Archives, and Museums / <i>Shiferaw Assefa</i>	1494
Everyday Life Information Seeking / <i>Reijo Savolainen</i>	1506
Evidence-Based Practice / <i>Prudence W. Dalrymple</i>	1516
Exhibition Design / <i>Lee H. Skolnick, Dan Marwit and Jo Ann Secor</i>	1523
Facet Analysis [ELIS Classic] / <i>Douglas J. Foskett</i>	1534
Faceted Application of Subject Terminology (FAST) / <i>Eric R. Childress and Diane Vizine-Goetz</i>	1539
Federal Electronic Information in the United States / <i>Carol D. Doyle</i>	1549
Film and Broadcast Archives / <i>Karen F. Gracy and Karen E. King</i>	1560
Film Archiving: History / <i>Steve Ricci</i>	1584
France: Archives, Museums, and Libraries / <i>Martine Poulain</i>	1589

Volume III (*cont'd.*)

Functional Requirements for Subject Authority Data (FRSAD): Conceptual Model / <i>Marcia Lei Zeng, Athena Salaba and Maja Zumer</i>	1606
Fuzzy Set Theory / <i>Donald Kraft, Gloria Bordogna and Gabriella Pasi</i>	1618
Games and Gaming / <i>Diane Robson and Breanne A. Kirsch</i>	1636
Genealogical Literature and Its Users / <i>Mavis B. Molto</i>	1644
Genre Theory and Research / <i>Catherine F. Schryer</i>	1662
Geographic Information Systems (GIS) / <i>Timothy F. Leslie and Nigel M. Waters</i>	1671
Geographical Literature: History [ELIS Classic] / <i>Nora T. Corley</i>	1683
Germany: Libraries, Archives, and Museums / <i>Claudia Lux</i>	1693
Global Open Knowledgebase / <i>Kristen Wilson</i>	1710
Government Documents: Collection and Management / <i>Aimée C. Quinn, Lori Smith and James Church</i>	1715
Greece: Archives / <i>Nestor Bamidis</i>	1728
Greece: Libraries / <i>Anestis Sitas and Mersini Moreleli-Cacouris</i>	1733
Greece: Museums / <i>Maria Economou</i>	1741
Grey Literature [ELIS Classic] / <i>Joachim Schöpfel and Dominic J. Farace</i>	1746
HathiTrust / <i>Rick Anderson</i>	1757
Health Science Professional Literatures and Their Users / <i>Cheryl Dee and Jocelyn Rankin</i>	1763
Historical and Archaeological Sites: Development and Preservation / <i>Robert B. Pickering</i>	1771
Historical Societies / <i>Mark Sgambettera</i>	1779
Historical Sources and Their Users / <i>Margaret Stieg Dalton</i>	1786
History of Libraries / <i>John Mark Tucker and Edward A. Goedeken</i>	1796
History of Museums / <i>John Edward Simmons</i>	1812
History of Paper / <i>Sidney E. Berger</i>	1824
History of Public Libraries [ELIS Classic] / <i>Frank B. Sessa</i>	1836
History of Records and Information Management / <i>William Benedon</i>	1850
History of the Book / <i>Jonathan Rose</i>	1859
History: Three Basic Printing Processes / <i>Sidney E. Berger</i>	1865
Hospital Libraries / <i>Rosalind K. Lett</i>	1870
Human-Computer Interaction Research in Information Retrieval / <i>Shin-jeng Lin</i>	1895
Humanities Literatures and Their Users / <i>Stephen E. Wiberley, Jr.</i>	1909
Hungary: Libraries, Archives, and Museums / <i>Katalin Radics</i>	1917
Hypertext and Hypercard: Early Development [ELIS Classic] / <i>Susan K. Kinnell and Carl Franklin</i>	1935
Illumination [ELIS Classic] / <i>Abdul Moid</i>	1945
Impact Assessment of Cultural Institutions / <i>Sara Selwood</i>	1958

Introduction to the Encyclopedia of Library and Information Sciences, Fourth Edition

How to Use This Encyclopedia

Entries are arranged alphabetically in this encyclopedia (see end papers for alphabetical list). The editors of this edition (ELIS-4) have decided to forego the Topical Table of Contents that was provided in ELIS-3 by editors Marcia Bates and Mary Niles Maack. At the time of publication of ELIS-3, the Topical TOC was crucial for readers to get a sense of how subjects were grouped and an understanding of the field or subfield through the clustering of categorical entries in the print edition. ELIS-4 is envisioned as a primarily online reference work where a Topical TOC does not serve the same purpose. The print edition is served well by the main TOC as well as the detailed index, while entries in the online version are easily discoverable through title, author, keyword, and full text searches.

In sum, relevant entries can be found by

1. Entry title (alphabetical arrangement of entries in the encyclopedia or listing in the end papers)
2. Specific name or keyword, including the index at the end of each volume

If the first name or keyword searched is not found, try several more variations—either different words or a different order of words. Most topics are described in several ways in the literature of a discipline, and the first term or phrase that comes to mind may not be the one used here.

Scope of the Encyclopedia

The title of the third edition, *Encyclopedia of Library and Information Sciences*, ended with the letter “s” because the encyclopedia was broadened to cover a spectrum of related and newly emerging information disciplines, including archival science, document theory, informatics, and records management, among others. The fourth edition continues this trend but with an extensive focus on the aspects of library and information sciences that have been heavily impacted by the adoption and reliance on online information distribution. This focus is reflected in the inclusion of numerous new entries such as digital preservation, altmetrics, web-scale discovery services, demand-driven acquisitions, and global open knowledgebases. Alongside these entries based on entirely new topics, the expanded use of the Internet for information has led to new treatment of traditional LIS topics such as resource description and access (RDA) that reflects the adoption of new standards for cataloging.

ELIS-4 also seeks to build upon the description of professional practice to round out the theoretical perspective that previous editions covered very well. Both current editors are academic research librarians and thus, focused heavily on addressing gaps in the encyclopedia related to academic research information while still relying heavily on the structure established by editors of ELIS-3. For example, ELIS-3 introduced country profiles and ELIS-4 builds upon that with new entries for New Zealand and a third on Brazil, in addition to revisions for Slovakia, Netherlands, Canada, Belarus, Kazakhstan, and Brazil among others. This edition also expands the number of entries for named cultural and information entities that did not appear in previous editions, such as the National Library of Medicine, North American Serials Interest Group (NASIG), the International Association of Scientific, Technical and Medical Publishers (STM), and ASLIB, as well as entities like the HathiTrust that have been established since the last edition was published. A number of new entries describing important information conferences such as the Acquisitions Institute at Timberline, the Charleston Conference, and Electronic Resources in Libraries (ER&L) also help round out the encyclopedia and further the description of the current state of academic research librarianship.

ELIS-4 also continues the tradition of designating important entries of historical or theoretical importance as “ELIS Classics.” These are entries by major figures in the library and information sciences or those that describe core concepts in LIS theory, practice, or education that appeared in earlier editions of the encyclopedia. The current editors preserved the approximately 40 previous “ELIS Classics” and designated 13 previous entries as new “ELIS Classics.”

There are more than 550 entries, of which more than 20 are new, another 93 are revisions to prior entries that have been brought up to date by their authors or by new authors, about 30 are ELIS Classics, and about 400 are reprinted from an earlier edition since they have remained relevant to the present. It is important to note that the editors also had to make some choices related to retiring entries that were no longer relevant—due to the passage of time and the development of the field, the technologies and theories described in those entries were deemed to be out of scope for the new edition and thus not revised or reprinted.

Encyclopedia Authors

As in past editions, the authors writing for the encyclopedia are major researchers, librarians and practitioners, and leaders in the fields and subfields in the disciplines in which they are writing. Noted scholars are well represented, and a number of authors are former leaders in LIS associations, including the American Library Association (ALA), the Association for College and Research Libraries (ACRL), the International Federation of Library Associations and Institutions (IFLA), the American Society for Information Science and Technology (ASIS&T), and the American Association of Library and Information Science Education (ALISE). In addition, there are many contributors who are current or former directors of major institutions. As in past editions, the editors are very proud of the range and diversity of authors who have written these entries for the encyclopedia and we thank them for sharing their expertise with the current and future readers and researchers in the field.

Finally, the editors for ELIS-4 have grappled with the challenges of entry generation that was noted by previous editors in nearly every edition: that not all ideas, topics, and potential entries were able to be completed for publication in this edition. While we made a valiant attempt to include entries identified by ELIS-3 editors but not secured for publication in that edition, we sometimes could not find authors willing to take those topics on. Similarly, we were sometimes unable to secure revisions to entries from new authors when previous authors were unable to perform that task. To the greatest extent possible, we endeavored to replace authors when entries were deemed important enough to appear in ELIS-4 but initial or previous authors had to decline or defaulted. No doubt, the editors of ELIS-5 will also pick up the mantle and attempt to round out the encyclopedia with entries for anything that ELIS-4 missed. As noted by editors Bates and Niles Maack in ELIS-3, this problem of missing topics was also acknowledged by Allen Kent, editor of the first edition of ELIS. Kent stated in 1973, "I have prepared this presentation to make sure the lessons of Diderot-d'Alembert are recalled in terms of encyclopedia-making as an exercise in the art of the possible."

Background and Development of the Encyclopedia

The first edition of ELIS, under the editorship principally of Allen Kent and Harold Lancour, was published between 1968 and 1982. The 33 volumes of the first edition were published in alphabetical sequence during those years. After the "Z" volume appeared in 1982, a number of supplements were published at roughly the rate of two per year, up to and including volume 73, which appeared in 2003. Miriam Drake was appointed editor for the second edition, which appeared in 2003, both online and in paper. The second edition came out at one time in four large-format volumes, with a supplement in 2005 [3]. Kent and Lancour covered a wide range of librarianship, information science, and some computer science topics. Drake, an academic library director, emphasized academic libraries, and the ELIS-2 volumes contained many profiles of major academic libraries and professional library associations.

The third edition, under the editorship of Marcia Bates and Mary Niles Maack, reflected a growing convergence among the several disciplines that concern themselves with information and the cultural record. As information science educators and noted researchers in the field, their focus was on growing the encyclopedia in the theoretical fields of information sciences as well as drawing together the associated information and cultural disciplines such as archival sciences and museum studies within the overall field of LIS.

For this edition, we have focused on developing the encyclopedia to reflect the changing nature of information production and consumption through online and digital forms. We have also endeavored to fill in gaps in the description of important people, places, and theories in the information sciences, and further enhanced the description of important concepts related to the provision of research information and the field's major institutions.

We continue to see the audience for the encyclopedia just as previous editors have: as principally consisting of 1) the educated lay person interested in one or more of its topics, 2) students learning about a topic, and 3) professionals and researchers in the several fields who want to learn about something new, or to be refreshed on a familiar topic.

We honored the previous editors by reengaging their superb Editorial Advisory Board with significant new additions of experts known to the current editors. (See listing in the front matter.) These leaders and experts from as many disciplines as are in the encyclopedia provided excellent guidance and feedback for the editors as they began the process of new topic generation, evaluation of previous entries, and offering to author or review numerous entries throughout the process of publication.

All new and revised entries were reviewed by one or more outside expert reviewer as well as one or more of the editors. Referees provided invaluable feedback to authors, including noting errors or omissions as well as making suggestions on additional aspects of the topic to cover. While we made every reasonable attempt through this process to check the accuracy of every entry and every fact, undoubtedly readers will find some topics explained more thoroughly or accurately than others. Indeed, due to the time frame from the beginning of the generation of the fourth edition and the time of publication, readers will reasonably note that some topics have been quickly superseded due to this passage of time, so the

date of acceptance of the entry will be noted on each entry since several years may have passed since the writing of the entry and the publication of this edition.

Acknowledgments

This edition of the encyclopedia was possible only through the countless hours that the editors, John McDonald and Michael Levine-Clark, spent reviewing the previous encyclopedia entries, outlining the topics that were missing or that were newly emerging in the field, and identifying appropriate expert authors to write those new entries. In addition, the editors devoted extensive time to corresponding with previous authors encouraging them to revise their entries, and finding replacement authors for important entries that needed revisions but whose original authors were unavailable. Both editors wish to acknowledge the expertise of each other and their knowledge of our field, their extensive network of contacts, and their ability to work closely together to ensure the success of this encyclopedia. Neither of them could have completed this project alone.

They acknowledge and thank the Taylor & Francis Group editors, Claire Miller and Rich O'Hanley, as well as Susan Lee, who passed away at the early stages of the preparation of this edition, and more recently, Alexandra Torres, who supported and kept the editors and authors on track over the course of the years of work on this edition of the encyclopedia.

The editors thank the authors who wrote and revised entries, and the huge number of reviewers who refereed the entries. Without their dedication, expertise, and willingness to share their knowledge with others, there would be no encyclopedia. They also wish to thank the Editorial Advisory Board for their advice, suggestions of topics and authors, their hours spent writing or reviewing for the final edition. They also wish to thank the previous editors, Marcia Bates and Mary Niles Maack, whose organization and structure for ELIS-3 provided an excellent blueprint for ELIS-4.

Academic Libraries

Susan Curzon

Jennie Quiñónez-Skinner

University Library, California State University–Northridge, Northridge, California, U.S.A.

Abstract

This entry provides an introduction to academic libraries throughout the world including an overview of the mission, history, governance, external influences, collections, services, organizational structure, personnel, administration, and facilities of academic libraries. The issues and future of academic libraries are also discussed.

INTRODUCTION

Academic libraries are libraries that belong to institutions of higher education, including publicly funded, federal, state, provincial, or national universities or colleges, privately funded universities or colleges, 2-year community or junior colleges that can be publicly or privately funded, tribal colleges, professional schools, and special focus institutions that offer a single or small set of programs. These institutions grant a range of degrees from the associate of arts to the baccalaureate and from the master's degree to the doctorate. This entry will provide an overview of academic libraries, including such topics as their mission, history, governance, external influences, collections, services, organizational structure, personnel, administration, and facilities.

The mission of academic libraries is to support the educational and research activities of their parent institution through the provision of collections, services, and user education. Providing support for teaching, learning, and research is the focus of academic libraries. Academic libraries are vital to the success of the academic enterprise of their institutions whose research and teaching agenda are greatly enriched by libraries whose collections are broad, rich, and diverse.

Academic libraries are found in almost all post-secondary educational environments. While there is no absolute count of the number of higher education institutions, there are at least 18,000 institutions of higher education throughout the world today as indexed by the *International Handbook of Universities*.^[1] There is no complete and final count of the number of academic libraries internationally. However, OCLC has a helpful spreadsheet revealing many academic libraries country by country.^[2] In the United States, there are 3700 academic libraries today according to the National Center for Education Statistics.^[3]

While the core mission of academic libraries remains consistent throughout institutions of higher education, academic libraries vary considerably from each other in

size, in resources, in collections, in services, in complexity, and in numbers of library facilities serving the institution. The variation is largely a product of the mission, the history, the size, and the funding of its parent institution. Looking at some examples of variations around the globe, there is the Harvard University Library founded in 1638^[4] to serve this institution's extensive research agenda and internationally recognized programs. It is the largest academic library in the United States by volumes held^[5] and has over 70 separate library units.^[6] Another example of variation is the University of Botswana formally established in 1982.^[7] Its library has a main and three branch libraries—two of which are located in other cities.^[8] Yet another example of variation is the University of the South Pacific, which has libraries located throughout its 12 member countries (Cook Islands, Fiji, Kiribati, Marshall Islands, Nauru, Niue, Samoa, Solomon Islands, Tokelau, Tonga, Tuvalu, and Vanuatu).^[9] This is in accordance with the University's vision of being "an exemplar of tertiary education in the Pacific region. . ."^[10]

HISTORICAL CONTEXT

From the early card catalogs to Online Public Access Catalogs (OPACs), from print indexes to periodicals via electronic article databases hosted online, the organization and access of academic library materials has changed dramatically over the past century. For hundreds of years, the predecessors of today's academic libraries relied on inventory lists, similar to contemporary archival finding aides, to keep track of books, scrolls, and tablets.^[11] During the nineteenth century, the rotary printing press, public funding for colleges and universities, and the emergence of the profession of librarianship laid the groundwork for the meeting of technology and user-centered services, which changed libraries in the twentieth century from a book focus to a user focus. As two academic librarians described in a popular online blog, the role of academic

libraries will be to meet the “Three Cs,” which are creation, collaboration, and contemplation.”^[12] New collaborative study spaces, creative media studios, or the silent mediation created in a reading room are continuing the rich history of academic library service to patrons as their needs change over throughout the years.

During World War II and throughout the Cold War, government funding for natural and social science research expanded to include area studies, such as Latin American studies. These new disciplines were integral in the development of new collections and the creation of new resources.^[13] The children of the World War II generation, the baby boomers, entered college during a time of great social and political change. Just as the student population increased, so did the collections in academic libraries, which now grew to 100,702,000 volumes.^[14] The Civil and Women’s Rights movements diversified the campus population and challenged the traditional research cannons. For libraries, as the population changed, so did library collections change with new subject areas, and so did new issues emerge in user services and education. With a large number of first-generation college students, the role of the academic library was not just to preserve a collection, but to continue a larger discussion within the profession, lasting into the twenty-first century about how to teach users to search independently and more effectively with a wealth of information now available in the library and online. For academic libraries, two great shifts in technology occurred during the twentieth century. The first shift occurred with the development of Machine-Readable Catalog (MARC) standards. In conjunction with MARC, the Anglo-American Cataloguing Rules provided the format for descriptive cataloging while the Library of Congress Subject Headings were used to describe the subject matter of a record.^[15] Automation of library records allowed computers to read information about a book using data elements, such as code. The first OPAC was launched in 1970 at Ohio State University and facilitated the sharing of library information between institutions, and in 1981 the Ohio State project would be known as the Online Computer Library Center (OCLC).^[16]

The second great shift, the 1990s, was the age of the Internet. For centuries, libraries were the primary source for information and materials, but the Internet broadened the meaning of library science and the potential for sharing information. Now, academic libraries were competing with information sources not just created by scholars, but sources created by everyday people who were challenging the library and faculty as the gatekeepers of knowledge. Libraries have responded by opening their collections to the public and increasing the sharing of resources to other libraries. Many archival collections have a portion of their materials, including photographs and finding aids, available online. Similarly, the OPACs are accessible through library homepages giving users throughout the world the ability to search the holdings at any particular institution,

at any time. More than a quarter century after OCLC was formed, WorldCat launched a public tool for searching over 2 billion items in over 10,000 libraries worldwide.^[17] In the years ahead, libraries in higher education face many hurdles: funding cutbacks, increased costs for electronic serials and books, and a changing student population with user-education needs. The demand for 24/7 access, cloud storage, and changes in publishing for books and distribution for films has impacted both the institution and library. The field itself is in a state of flux and self-discovery as academic libraries rethink their place in the larger world of information. Much of the strength of library resources lies in their print collection and knowledge of staff. Finding ways to package and promote services to a new generation of students and faculty will require opening the field to opportunities for increasing the sharing of resources, for cooperatively creating online tutorials and instructional components for the growing online classes. Our success will depend on the ability of the librarians and administrators to adapt to social, economic, and political changes that have impacted academic libraries throughout the twentieth century.

EXTERNAL INFLUENCES

Academic libraries, as a key component of the academic enterprise, are influenced by the same forces influencing education today. While these forces vary from country by country, such important issues of student enrollment and retention, student preparation for college, time to graduation, competitive salaries for campus personnel, trends in academic disciplines, distance instruction, changes in educational legislation, assessment, the rising cost of tuition, technology-based instruction, and adequate funding are universal and impact the library. The library must assist with solving the institution’s challenges, exist within the confines of its budget, and react to its changing needs. Other external influences related to accreditation, legislation, intellectual property, and the actions of organizations and associations can also impact the library very directly.

Accreditation is an important external influence in some countries. Within the United States, for example, there are regional commissions that accredit the universities because “in a quality assurance environment, accreditation is the most visible ‘report card’ regarding the quality of institutional effectiveness and performance.”^[18] Academic libraries are often evaluated as part of the accreditation process on the range of services, the depth of collections in a variety of subject fields, the outreach to the academic departments, the integration of the library into the academic enterprise, and the information literacy focus. The core question for accrediting agencies is, can this library support the stated educational and research mission of the institution?

To assist with this process, the Association of College and Research Libraries (ACRL) in the United States “promulgates standards and guidelines to help libraries,

academic institutions, and accrediting agencies understand the components of an excellent library.”^[19] An extensive list of standards, guidelines, and policies is provided,^[20] including the *Standards for Libraries in Higher Education*, which are “designed to guide academic libraries in advancing and sustaining their role as partners in educating students, achieving their institutions’ missions, and positioning libraries as leaders in assessment and continuous improvement on their campuses. Libraries must demonstrate their value and document their contributions to overall institutional effectiveness and be prepared to address changes in higher education. These *Standards* were developed through study and consideration of new and emerging issues and trends in libraries, higher education, and accrediting practices.”^[21]

Academic libraries can also be impacted and controlled by legislation or governmental regulations. For example, the American Library Association has raised concerns about provisions in the USA PATRIOT ACT, which may “endanger constitutional rights and privacy rights of library users.”^[22] Any legislation that impacts the user’s borrowing and searching history is a sea change as user privacy has been protected historically in most academic libraries.

Another example of an external influence is intellectual property, which has grown ever more complex with emerging technologies. As the American Library Association states, “Copyright issues are among the most hotly contested issues in the legal and legislative world; billions of dollars are at stake. Legal principles and technological capabilities are constantly challenging each other and every outcome can directly affect the future of libraries.”^[23]

Of course, in the global economy, intellectual property issues are not simply an issue for one country alone. For example, countries that are members of the World Trade Organization know of the “Agreement on Trade Related Aspects of Intellectual Property Rights, Including Trade in Counterfeit Goods,” which “sets out the obligations of member governments to provide procedures and remedies under their domestic law to ensure that intellectual property rights can be effectively enforced, by foreign right holders as well as by their own nationals.”^[24]

Another example of a global influence is the agreement between the European Union and the U.S. Department of Education with the European Union-United States Atlantis Program. Among other activities, “the Atlantis Program will fund collaborative efforts to develop programs of study leading to joint or dual undergraduate or graduate degrees.”^[25] Such cooperation is very desirable globally but may call upon academic libraries for increasing or new services.

PROFESSIONAL ASSOCIATIONS

Academic libraries are also participants in and influenced by professional associations. Such associations further the

success of academic libraries by providing a forum for the exchange of ideas, by influencing public policy relating to libraries and information and higher education, by providing opportunities to network with colleagues, by creating opportunities for cooperation and dialogue, and by providing leadership on emerging issues.

Library associations for academic libraries are all across the world. For example, there is the Association of Caribbean University and Research Libraries located in Puerto Rico; the International Association of Technological University Libraries located in Ireland; the Canadian Association of Research Libraries/Association des bibliothèques de recherche du Canada located in Ottawa or the Association of Libraries of Czech Universities located in Prague.^[26]

Academic libraries also participate in the International Federation of Library Associations and Institutions (IFLA). IFLA has an Academic and Research Libraries Section, which “provides members with the opportunity to exchange experiences and ideas with colleagues worldwide and is a vehicle for collaborative action.”^[27]

In the United States, the American Library Association has a division called the ACRL. ACRL is “dedicated to enhancing the ability of academic library and information professionals to serve the information needs of the higher education community and to improve learning, teaching, and research.”^[28]

Another example is the Association of Research Libraries (ARL) whose 125 member libraries are research-extensive universities in the United States and Canada. ARL is focused on “providing leadership in public and information policy to the scholarly and higher education communities, fostering the exchange of ideas and expertise, facilitating the emergence of new roles for research libraries, and shaping a future environment that leverages its interests with those of allied organizations.”^[29]

There are other associations and organizations that set standards, which have an impact on libraries. For example, the National Information Standards Organization (NISO) “is a nonprofit association accredited as a standards developer by the American National Standards Institute, the national clearinghouse for voluntary standards development in the United States.”^[30] NISO is “where content publishers, libraries, and software developers turn for information industry standards that allow them to work together. Through NISO, all of these communities are able to collaborate on mutually accepted standards—solutions that enhance their operations today and form a foundation for the future.”^[31]

GOVERNANCE AND HIERARCHY

The governance of academic libraries is subject to the governance structure of the colleges or universities of which they are a part. This governing structure establishes

the budget as well as the policies and the regulations with which the library must also comply.

The governance of institutions does vary but usually the institution reports to a lay governing board, often called a Board of Trustees, whose members are either elected or appointed from such groups as alumni, faculty, community members, major donors, or political or religious affiliates. Occasionally, there is a nonvoting student representative. A lay governing board governs within the charter and by-laws of the institution that lays out their rights and responsibilities and that is legally binding. One example of a lay governing board is from the University of Queensland in Australia, which is “governed by a 22-member senate representing University and community interests.”^[32] Another example comes from the University of British Columbia in Canada, which has a 21-person board of governors including 11 persons appointed by the lieutenant-governor of the province.^[33]

The head of the institution, frequently called a president or chancellor, reports directly to the lay governing board. In turn, the chief academic officer often called a provost, a vice chancellor, or vice president, reports to the president or chancellor.

The head of the library, who often uses such titles as university librarian (UL), dean, director, and occasionally vice-president or vice-provost, often reports to the chief academic officer because libraries are part of the academic enterprise or the activities of teaching, learning, and research, all of which are the domain of the chief academic officer.

Additionally, the library might also have faculty advisors appointed or elected by the academic senate of the institution. The academic senate, which not all institutions of higher education have, comprises faculty members elected by their peers to participate in the shared governance of the institution in matters pertaining to teaching, curriculum, research, and faculty personnel matters. These faculty senators work directly with the UL advising on such matters as policy, services, and budget as well as providing the UL with input on the changing needs of the faculty and students. These faculty advisors might also act as advocates for the library particularly in supporting the library's financial needs.

ORGANIZATIONAL STRUCTURE

The organizational structure, that is, the way that the service units within the library are organized hierarchically, varies substantially in academic libraries depending upon size, history, and need. The following is a general description of a common organizational structure with discussion on some variations. Generally speaking, many academic libraries are divided into Public Services and Technical Services, although there are many variations on the names. All services or units report into library administration.

Library administration usually comprises the Office of the University Librarian as well as management and staff personnel associated with planning, policymaking, budget, personnel, facilities, security, and fundraising. Often, the UL has one or more assistant or associate university librarians (AULs) responsible for various service units such as Public Services. Administration collectively is responsible for leadership and all its many dimensions, for the provision of resources and for decision-making. Administration also has a regulatory role to make sure that the library is in compliance with policies, regulations, and budgetary matters.

Public Services, which usually reports to an AUL or equivalent, is responsible for connecting the user to resources through the provision of direct services that make the library understandable, accessible, and easy to use. Public Services comprise service units such as reference or research services, user education such as information literacy or media literacy, circulation, interlibrary loan, media, government documents, maps, and other specialized services. Sometimes, outreach services to students is located here and sometimes in Administration. The reference services unit and the user education unit can often be separate services from Public Services.

Technical Services, which also reports to an AUL or equivalent, comprises the acquisition, the cataloging, and the processing of resources. It is the job of Technical Services to order, receive, and process resources in an expeditious fashion so that the resources are available to the user as soon as possible. Bindery and repair of resources are usually located in Technical Services. Many Technical Services units today have contract personnel because some of the traditional responsibilities of Technical Services, personnel are being outsourced such as the copy cataloging, bar coding, and labeling of books.

Collection development/bibliography, or the selection of resources, can be located in Technical Services or in Public Services, but it could also be a separate unit if the library is large enough. Personnel in this unit, usually librarians, are responsible for selecting all information resources, including print, electronic, and media. Librarians with collection development responsibility work closely with faculty in the academic departments so that the collection continually meets the changing curriculum and current research needs of the institution.

Library Systems, or the unit that is responsible for library technology, can exist as one unit managing the integrated library system, the web development, other online systems, and the computers and computer labs. Management personnel, such as a systems administrator or director of technology, usually are responsible for Library Systems. However, these duties can also be split into different areas. For example, the personnel who support the integrated library system might report to Technical Services. The web developer might report to Administration. Personnel

who manage the computers and computer labs might report to Administration or to Public Services.

Special collections of rare materials, archives, maps, oral histories, and other resources are usually a separate unit particularly in libraries of considerable size. Special collections are usually headed up by a curator or highly specialized librarian versed in both the subject matter and in the preservation and conservation of the materials. The curator may report to the AUL of Public Services or to the UL. Often, exhibits come under this unit as exhibits are an important way of making the academic community and beyond aware of these unique resources. Increasingly, digital archives or institutional repositories are embedded within special collections. However, these emerging fields are not yet stable in their operations, are usually interdepartmental by nature, and so could report anywhere in the library.

Large institutions of higher education usually have more than one library on the campus. In fact, large research universities can have dozens of libraries on campus. For example, Oxford University in England has over a 100 separate libraries serving 38 colleges and other units.^[34]

Sometimes, libraries in these large institutions are united under one UL, but often not. For example, the heads of medical or law libraries often report directly to the dean of the medical or law school rather than the UL. The head of an academic departmental library, such as a business library, could report to the dean of the college of business rather than the UL.

Sometimes, academic departments launch their own small library without regard for the professional management of libraries, for an ongoing budget, for staffing, for access, or for continuing acquisitions. Many of these little libraries end up shuttered after interest wanes, and materials go missing. Occasionally, an academic department eventually will ask the academic library for help, which presents an opportunity to rescue resources, some of which may be important donations, and to strengthen a partnership with this academic department.

Institutions of higher education that have developed satellite campuses to reach students in remote geographic areas usually have satellite libraries on those campuses. The heads of the satellite libraries might also report to the UL.

Regardless of the reporting line, it is increasingly important for the libraries in one institution to cooperate through a single technical integrated library system, by access to shared resources, by a common portal, common policies and procedures, and by shared Technical Services support. This cooperative and integrated approach benefits greatly the students and faculty.

The important issue is not how the library is organized but how efficient and effective its structure is and how well its systems and processes are integrated for the benefit of the user.

USER PRIVILEGES

The users of academic libraries are primarily students and faculty of the parent institution. Academic libraries also extend library privileges to visiting scholars and other researchers. Publicly funded colleges and universities may provide some limited library privileges to members of the greater community. Members of the Friends of the Library, a fundraising and support group, alumni, other significant friends, and donors also usually receive some limited library privileges. Sometimes, there is reciprocity between nearby academic libraries to extend library privileges to each other's faculty and occasionally students.

Library privileges in academic libraries are not consistent across groups of users. Along a continuum of increasing privileges, faculty members usually receive the most privileges as befitting their pivotal role in a teaching and research enterprise. After faculty come graduate students in terms of range of privileges and then undergraduate students. University staffs also receive privileges, which can vary widely but is often similar to the privileges of undergraduate students. Employees of the library may sometimes have special personal use privileges.

The range of library privileges include the ability to checkout resources including media; to use interlibrary loan; to request document delivery; to access online resources; to access course reserves; to use the computers; to browse closed stack areas; to use private study carrels and group study rooms; and to access rare and valuable materials.

RESOURCES AND SERVICES

Each generation of library users has had different expectations for service and access to their library's collection, resources, and services. In response, academic libraries are continually adapting to their user's needs and lifestyles.

The purpose of library services is to connect the user to resources and support research, instruction, and lifelong learning. However, the development of services throughout the years is based on the idea that the library should be user-friendly, straightforward, and rapid in response. Enhanced services and expert staff continue to add value to the library. The academic library is also a "community center" with experts to assist students, faculty, and surrounding neighborhoods.^[35]

Resources and Expertise

As information is more accessible online, experts in copyright, digital content management, and digital preservation are necessary for campuses with robust research and creative projects. Scholarly and instructional content created

by faculty and staff must be organized and preserved for the success of scholarly communication. More libraries are restructuring based on areas of expertise: instructional design, digital preservation, web services, and copyright. Resources include the instruction, research consultations, digital preservation and archiving, web services and information technology, rare books and special collections, and finally the ongoing role of librarians in copyright and accessibility issues. Many libraries inform patrons about services and resources via strategic outreach and marketing plans that often include social media.

Many academic libraries have a designated outreach librarian who informs the campus about new services and resources. Outreach is an education service provided by the library to raise awareness, educate patrons by bringing library services or information about services directly to them. Typically, the outreach librarian is tasked with the important work of making the services and resources of the library visible to new students and faculty. New faculty orientation and freshman welcome week are two opportunities for publicizing new services and collections to the campus community. Some outreach librarians also work directly with primary and secondary education in their service areas. A local teacher might want to bring his/her class to campus to visit an exhibit in special collections, tour the facilities, or request an information literacy session for a class. With school libraries underfunded, the college or university library often partners to ensure students have access to materials and prepared to enter a higher education institution.^[36] Most librarians have an outreach responsibility to their job description as a department or college liaison that is critical to disseminating information about services and resources to the campus.

Digital collections of a library are often materials from special collections and archives. It is important to note that digital collections are not entirely special collections and a great deal of work is happening to preserve the intellectual works of faculty. Staff with expertise in digital libraries, repositories, and preservation work directly with faculty on campus to make sure that copies of their scholarly publications, digital learning objects created for courses, or even creative projects are available online for future generations. This is a relatively new service provided by libraries and requires staff with technical expertise and an outreach plan to educate faculty about the benefits of contributing their works to a repository on their campus.

Copyright advisement is necessary on campuses with research or instruction foci. Staff at the library guide and advise faculty (and administrators) regarding fair use and equitable access of materials for instruction or research. Faculty seek advice when signing a contract for publication with a particular publisher and have questions about their contracts and what they are able to do with their work. Professors teaching an online class often need assistance locating materials in the collection that can be shared via a learning management system (LMS). For

works in archives, copyright becomes increasingly important as more pressure to digitize collections results in difficult questions about who owns the rights to unique and rare materials donated to the library. As more types of information, media for example, are easily shared and streamed, this continues to be an important issue for libraries and campus administration.

An area of continued growth is instruction, instructional design, and information literacy services provided by librarians for undergraduate and graduate classes. Librarians at a college or university teach users how to find, access, evaluate, and understand what information sources are needed (e.g., articles, books, media, and websites). Information literacy programs at academic libraries consist of a combination of in-person instruction and online learning objects to enhance student learning. The development and mainstreaming of instruction programs share a common purpose—provide students with the training to help them complete their assignments and develop critical thinking skills for their life during and post college. The popularity of these programs increased with major information literacy initiatives started, for example, by the California State University librarians who brought a program of information literacy to 23 campuses.^[37] In today's academic libraries, bibliographic/library instruction often takes place once a semester in a computer lab or online via a LMS, both types of instruction require collaboration with instruction faculty on campus and librarians to create meaningful information literacy learning outcomes for a class. Throughout the year, librarians teach a variety of sessions that cover a wide range of subject from general information literacy tasks to more specialized research skills.

Digital services and online instruction design positions at libraries provide faculty and students with resources such as customized tutorials, library guides for course projects, quizzes and assessment of learning outcomes, and new ways of accessing primary sources. Library staff and faculty collaborate to scaffold information literacy standards throughout the undergraduate curriculum. Often, undergraduate first-year experience classes and introductory writing classes have some type of information literacy requirement. The expertise of the staff and their ability to connect faculty and students to resources is a service to the campus, and while not contained by a traditional desk, their outreach to users in the digital space, LMS, is critical to the mission of the library.

Reference

The reference desk provides immediate one-on-one research assistance usually from a librarian. A reference interaction can be as simple as pointing out the circulation desk to a lost library visitor or can involve more complicated research questions. Most reference questions require extensive knowledge of the library's collection and a solid

subject specialization in a particular discipline. The role of the reference desk as a service point is a topic of continued debate in library science and among administrators. Statistics from ARL show a decrease in reference transactions between the years 1991 and 2004, by 24%.^[38] The statistics from ARL were further explored in a 2012, which indicated that more spending on electronic resources actually increased reference transactions.^[39] More libraries are moving to data collection systems, such as LibAnswers, to capture the different types of questions, duration of time spent helping the patron, and additional rich data that describes the interaction between library (or staff) and patron (undergraduate, graduate, faculty) that could be helpful in evaluating and improving library services in the future. Reference services are also handled through chat, e-mail, and texting services. Patrons can also request one-on-one research consultations with a librarian for more time-extensive questions. While some libraries have moved away from the reference desk, most offer a hybrid of services and see the desk at a critical site for outreach to patrons. Many visitors at the reference desk are first time library users and might not have found an online reference or office appointments.

Public Service

The entire library can best be understood as a network of services and resources that work together through careful coordination of library staff (and faculty) to provide seamless access, organization, and context to the information used by faculty and students. The traditional public service sites include the circulation desk, interlibrary loan, course reserves, and specialized departments, such as music and media collections.

Circulation: The circulation unit in the library is a key access service point. As library leadership looks to brand service points, changing the name of the circulation desk is happening as renovations and new outreach plans are created at academic libraries. At the circulation desk, users can checkout library materials, renew books, return materials, and pay fines; these functions are some of the more visible and traditional tasks associated with the circulation desk. Circulation personnel usually staff the library for all hours that the library is open. In addition to overseeing student employees, they shelve books, supervise group and individual study rooms, collect books from campus book drops, manage holds and fines, tag damaged items for repair, assist students with disabilities, troubleshoot printing and copying, oversee weeding/shaping of the print collections, and collect statistics when necessary. Staff in circulation serves as backup to other service desks, often managing problems or troublesome users and

responsible for contacting campus police or other emergency services as needed.

Interlibrary loan: Interlibrary loan broadens the user's access to a collection, beyond the holdings of their own library. There are three items that are typically requested via interlibrary loan (depending on institution): books, periodical articles, and dissertations or theses. Many libraries will also lend media and microfiche. Articles are usually delivered to users as a PDF unless there are strict copyright rules or the publication is not available online. As more libraries purchase e-book subscriptions, the loan of books is changing. Most ILL requests for books and dissertations are delivered physically through the mail or intersystem delivery services (i.e., University of California).^[40]

Course reserves: As the cost of textbooks increases, students and faculty continue to look to the library for affordable options to support instruction on campus. Academic libraries manage course reserves where faculty can place books, media, and articles on a limited check out for their students. Some course reserve programs coordinate with instructors and order a copy of a textbook for a library. Others are working with faculty to create a collection of readings (journal articles and book chapters) that are available through electronic course reserves. Electronic reserves includes selection of readings that are scanned and only students associated with the course are able to access with their login and password. Staff that work in course reserves are familiar with copyright and fair use because so much of their day-to-day work involves balancing fair use with the rights of users to have access to a particular subject. One challenge for academic libraries are the growing number of online courses and streaming rights for film that differ in cost greatly from what an individual can purchase and the pricing for an institution.

Systems and technology services: Most academic libraries provide computers for student use including laptop or tablet checkouts. Computer use is a common service associated with library systems, but their services extend beyond the hardware. Partnerships with campus information technology provide better quality services to users. One example is the integration of more cloud-based software by IT departments that are used by library patrons for research and projects. Systems and information technology departments within the academic library are also developing new services and technologies through a variety of initiatives to develop mobile sites, dynamic library websites, and Content Management Systems (LibGuides), blogs, wikis, indexed-based discovery systems, institutional repositories streaming servers, digital archives, and any other software

running off the servers that enhances the experience of library users. With hundreds of databases and thousands of e-books, the staff with technology expertise are necessary in making sure the patron's experience searching for sources and using resources at the seamless. Patrons continue to expect the same type of online experience at the library as they do with commercial services, the library systems/technology staff work to leverage resources (hardware/software) to meet these expectations within reason.

Imaging services: More campuses are reducing the amount of paper and printing generated on their campus; as they look for more alternatives to print, there are some instances when students need to print a paper, unofficial transcripts, or documents for presentation. These photocopy, printing, and even faxing needs still exist. Most libraries are unable to subsidize image services and opt to outsource to a vendor rather than provide them directly. A partnership is formed and both the library and vendor share in the profits (if any) from printing.

TECHNICAL SERVICES

Technical Services is responsible for acquiring materials for the collection in support of the mission of the research and educational priorities. Traditional functions included in Technical Services operations are acquisitions, cataloging, preservation, and conservation. After the bibliographer selects materials for the collection, an acquisitions unit, within Technical Services, is in charge of orders, payments, tracking budgets, and processing received materials. Academic libraries purchase books and other media that are printed by many different publishers, but dealing with so many publishers individually would be a logistical headache for the library's staff. To simplify purchases, there are vendors, sometimes known as jobbers, who act as the intermediary between the academic library and publisher. Many libraries work with several different vendors as opposed to thousands of different publishers. Vendors are not the only source of materials, but they help consolidate the purchasing process for a large number of items within the collection. Once materials are received (physically or digitally), the item moves to cataloging. Cataloging is the process by which entries are made into the library's catalog of holdings. These entries include descriptive information about the book, subject headings, and call numbers. An academic library in the United States generally uses the Library of Congress Subject Headings to describe content of a book, periodical genre, media, and, sometimes, special collections; one item can have several different subject headings. A call number is generated from the 21 main classes found in the Library of Congress.

Other classification schemes include the Dewey Decimal System, not often used in academic libraries, and the U.S. Superintendent of Documents classification system for federal documents. Cataloging at an academic library can take two different formats: copy cataloging and original cataloging. While copy cataloging, or the use of existing cataloging from a bibliographic utility, has helped institutions standardize their metadata, the more specialized and rare materials require original cataloging by a subject specialist. Next, the library's staff prepares each item for the stacks by placing checkout slips, ownership stamps, classification labels, security strips, and protective covers as needed on the item. With more vendors offering shelf ready materials, many libraries opt to pay upfront for these activities. Most libraries have a split with some items coming shelf ready and some being processed in-house. Some items will take a different path through Technical Services. For example, print journal subscriptions will be checked in with close attention being paid to verifying that the journal is on schedule or initiating the claiming process to the publisher if not. Electronic resources are very complex and require staff that specializes in their management. Activities include establishing and checking links to databases or e-books, ensuring that materials are still accessible, troubleshooting, and the monitoring of license agreements. Conservation and preservation are two additional functions of Technical Services. For print collections, the definition of conservation is the "noninvasive physical or chemical methods employed to ensure the survival of manuscripts, books, and other documents" and preservation can be a "broad range of activities intended to prevent, retard, or stop deterioration of materials or to retain the intellectual content of materials no longer physically intact."^[41] Both definitions describe conservation and preservation as it relates to print resource, but libraries are working together now to address some of the unique preservation issues involved in digital collections.^[42] An academic library's efforts in caring for its resources can vary widely from a small in-house repair effort to a substantial unit with specialized staff handling valuable and rare materials. As more collections are available online, and this is especially true for serials, the function and role of Technical Services will continue to develop. Two issues of interest for the future are outsourcing and the development of digital collections. First, outsourcing for cataloging and processing is an increasing option for academic libraries. Reaction to outsourcing is mixed. On one side, sending materials offsite decreases some of the staffing and work at the local level reducing costs. On the other side, outsourcing may adversely affect the quality of local cataloging. The second issue for academic libraries and Technical Services is the continuing development in electronic resources and digital content. This introduces

concerns such as the role of licensing agreements, assessing copyright for online journals and article databases, and the tracking and cataloging of these resources. One significant issue is that the idea of ownership is blurred with electronic resources. Once the subscription stops, the library has lost its investment unless back files have also been purchased. Librarians are now working for guarantees that the materials available today will be available and accessible for patrons in the years to come. This is referred to as perpetual access. This is problematic when there is no guarantee of the lifespan of a vendor or publishing company, and therefore, there are no guarantees that access will be the same. The role of Technical Services is the management of these resources and ensuring that both print and electronic resources are available to users.

ADMINISTRATION

Most academic libraries are multimillion dollar operations and as such require the same sound management principles that any business requires to succeed. Planning, leadership, policymaking, customer service, personnel management, assessment, marketing and outreach, communication, and budgeting are all vital components and must be managed with the same skill as in any other business.

Planning is vital for success in order to keep academic libraries viable with their academic community particularly by keeping up with the dynamic changes within the information and technological environment. Most academic libraries have a strategic plan to point the way forward. These plans are usually renewed every 5 years and are linked to the university's broader strategic plan. In one example, the University of Tasmania clearly states that "the UTAS strategic plan, Open to Talent, frames the context for the Library's plan."^[43]

Customer service is a vital component of academic libraries. A focus on the needs of the students and faculty is essential as the library is an important player in the teaching, learning, and research process. Students and faculty rely upon the library to provide them with essential knowledge resources. Some libraries, in order to understand user needs, have participated in LibQual, which is offered by the ARL and which is used to "solicit, track, understand, and act upon users' opinions of service quality."^[44] These and other assessment methods have helped libraries to continually understand their users and to make needed changes in resources and services as user needs alter.

Another example is marketing and outreach. In this increasingly complex electronic environment, libraries have many competitors for the users searching for information in spite of the depth of scholarly resources that academic libraries provide. In order to encourage usage and maintain visibility and viability, marketing and

outreach are vital. For example, most academic libraries issue information about new acquisitions or new services through social media, on the library's web pages or through informative, glossy newsletters that are often electronic now.

Libraries also offer programs to attract the academic and surrounding community such as speaking engagements with well-known authors or scholars and exhibit openings. These events frequently have a fundraising purpose also.

Outreach can take many other forms. Most libraries participate in new student orientations and new faculty orientations and offer workshops on library research. Some libraries participate in outreach efforts before the students enroll in college by offering advanced placement privileges for high school students.

Importantly, it is vital that the library, through its UL and its librarians, have close relationships with the colleges and the academic departments. While the UL works closely with college deans, librarians are often assigned academic departments and work closely with department chairs to make sure that the library is fulfilling the needs of that academic discipline.

Increasingly academic libraries are required to participate in fundraising to supplement the budget. Fundraising can take many forms including obtaining rare collections, endowments, support for library services, collections and programs, funding for buildings, equipment and furniture, and so on. In order to have successful fundraising, the library needs to have a director of development and other fundraising staff in order to work closely with the donors. It is a significant effort, which can have significant results but which requires a long-term effort.

In order to achieve economies of scale and expand their fiscal reach, some academic libraries are engaging in cooperative buying. A good example is the California State University. In their *Libraries of the Future* report, "The CSU has managed the cooperation of all 23 campuses to negotiate significant discounts in the cost of academic content, software licenses, and vendor training and support services."^[45]

Academic libraries that are in a consortium can also take advantage of membership in the International Coalition of Library Consortia (ICOLC), which comprises of 200 library consortia around the world. The ICOLC is "dedicated to keeping participating consortia informed about new electronic information resources, pricing practices of electronic information providers and vendors, and other issues of importance. . . ."^[46]

Vigilant, skilled, and supportive library management, dedicated supervisors and staff, close attention to the users, comfort in the face of continual change, and a deep commitment to quality service are some of the most important components in the successful administration of an academic library.

ACADEMIC LIBRARY PERSONNEL

Academic libraries are staffed by a mix of personnel. The proportion of librarians in libraries is relatively small to the total number of personnel. Most categories of staffing fall into librarians (i.e., persons with a degree in library or information science), library assistants (i.e., specialists in the work of libraries), clerical, student employees, and administrators. There are also other specialists in the fields of accounting, personnel, building management, and, of course, technology (See *Academic Librarians*).

LIBRARY BUILDINGS

Academic library buildings range greatly in size depending upon their purpose, history, size of collection, size of student population, and available funding. Regardless of size, many similar issues confront academic libraries today in terms of their buildings. The most challenging of these issues is the impact of digital information and therefore a common belief that library buildings are either not needed or can be greatly reduced when the physical collection is not growing at the rate it once did. A more sophisticated view is that the role of the library is expanding and changing and therefore demanding new uses of its facilities in addition to its traditional uses.

As Leighton and Weber point out, “the library is recognized more than ever as a locus for educational effort in a social setting. The building must meet the need for the ‘library as place’ within academe. . . .”^[47] The authors go on to say that “. . . this intangible characteristic is often a major force in shaping the academic objective of the library building to meet the institutional goals for the years ahead.”^[47]

One of the most compelling trends over the last two decades is the creation of an information commons that largely refers to a place where students have access to both information and technology resources. This concept emerged because students needed a place where they could use the latest technology, research and write their paper online, and/or create a multimedia presentation. Importantly, an information commons provides the students with a sense of place and shared community. The layout of the room often encourages collaboration and group work.

For a good example, see the University of Southern California (USC) in Los Angeles, which was one of the early pioneers in creating an information commons. The USC provides a full range of services, including computers, research and writing support and consultation, technical support, adaptive technologies, printing, and collaborative workrooms.^[48]

Study facilities have also changed significantly in recent years. There is a push for more student-friendly study areas largely out of concern that students will no

longer come to the library because of the remote access provided to digital resources. In order to encourage studying and learning in the library, more attention in the library today is directed at learning spaces that are more comfortable with better seating and wireless access. Additionally, students now need more collaborative and group study space in order to work on group projects assigned by their professors or simply to study together. These rooms or areas designated for collaborative study often have flexible seating, with technology supportive of group work.

In keeping with the need to attract students, libraries are also relaxing the rules about drinks and sometimes food in the library. Academic libraries are also adding coffee shops to lure students in and also to benefit from the proceeds. For example, the University of Waterloo’s Dana Porter Library in Canada has “Browsers,” which is a coffee shop located on the main floor of the library and which provides students with an area of relaxation for studying, being with friends and enjoying a cup of coffee.^[49]

What is still unknown is whether or not more comfortable spaces, increasing group study rooms, and providing cafes have actually increased students’ study time or improved their study habits.

Libraries in the United States today also need to be very conscientious to come into compliance with the Americans with Disabilities Act (ADA) of 1990, which gives civil rights protections for persons with disabilities. The ADA requires that buildings be both usable and accessible to a person with a disability including both customers and employees. A library today needs to make sure that it is removing barriers to access, designing for accessibility, or providing alternative access.^[50] Many libraries also go a step further by providing students with disabilities with special rooms and/or special assistive technology equipment such as adjustable furniture, Kurzweil reading machines, speech recognition software, magnifiers, and screen readers.^[51]

As print collections grow beyond the capacity of the library to retain, some libraries are weeding but more and more are developing alternative storage places. The world’s first automated storage and retrieval system was developed at California State University Northridge’s Oviatt Library. This system contains over 13,000 bins occupying an 8000 ft² facility that is 40 ft high and allows for over one million items to be stored. This library uses the storage facility for lesser used materials and older periodicals. The system interfaces with the library’s catalog and the user commands the system to retrieve the item needed.^[52] Approximately 20 libraries in the United States have this system.

Some academic libraries use offsite storage. For example, the University of California maintains the Southern Regional Library Facility, which is offsite storage for lesser used but still needed collections. Storage is not

its only responsibility. This service sends books for interlibrary loan, guaranteeing 24 hour service for its member UC libraries, and also is engaged in preservation and digitization.^[53]

Another example is the Harvard University Library's the Harvard Depository, which was designed to be modular so that more storage units can be added as resources increase. This depository is offsite, secure, and accessible as well as climate controlled. It is a cost-effective method to store resources in an environment that preserves resources for the long term.^[54]

Libraries now and in the future must be able to be flexible in their spaces, provide robust technology, and create collaborative study spaces and a more appealing environment. This is all coupled with the need to still provide for the care and housing of the collection for the wide range of services and of course a good environment for the users and the staff. This is particularly challenging in older buildings that may not be scheduled for renovation or rebuilding. The American Library Association has a useful web page for any academic library that is building a new building or renovating an older one. This page contains a wide range of resources.^[55]

CONCLUSION

The continually changing world of digital information continues to have a dramatic impact on academic libraries in terms of services, resources, facilities, and the skill set needed for personnel. As the premiere support service to teaching, learning, and research, academic libraries will continue to thrive and play an important role but their future will require vigilance. Academic libraries need to become easier to use in order to compete effectively against popular search engines and other online services and companies that are aggressively adding information sources including scholarly ones. The online presence of the library, including its services and its information resources, will need unflagging attention so that students and faculty have the 24 hour easy access that they have come to expect in a digital world. The rare collections of academic libraries must be digitized continually to provide access to unique resources. The environment will always need to be scanned for significant changes in technology and user needs so that the library's strategies can shift in keeping with the times. Marketing will play an important role in order for the voice of libraries to be heard above the crowded world of information. An enhanced focus on national and local policies affecting libraries including intellectual property is vital.

Given their strong sense of purpose, the richness of their resources, and the dedication of their staff, academic libraries will maintain their all-important mission of supporting teaching, learning, and research.

Abstract

Although libraries have come a long way in making their spaces, places, and Web sites in compliance with the Americans with Disabilities Act (ADA), there are still issues and challenges in providing services and materials to individuals who have a physical challenge or disability. This entry looks at traditional services and materials libraries have offered and also new technologies libraries should consider for serving this population. Because the ADA was passed almost 20 years ago, it did not really address the Internet and the World Wide Web. The ADA is a civil rights law to prevent discrimination because of disability. Disability is defined as “a physical or mental impairment that substantially limits a major life activity.” The ADA requires places and services for the public to be accessible, but there is no specific reference to the Internet as a public place of accommodation for people with disabilities. This is where Section 508 of the U.S. Code comes in. This entry will discuss specific ways in which libraries are complying with the ADA and Section 508 and where progress needs to be made.

SERVICES WHICH HELP WITH ACCESSIBILITY

For libraries that are Carnegie-type buildings or that cannot afford the changes necessary to their physical libraries to make them accessible, there are services they can offer that help make the library accessible and show the library as a concerned agency that wishes to serve everyone.

Making a Building Accessible

There are numerous ways the bricks and mortar library can make itself accessible. Entire books have been written on this topic, but basic building accommodations can include an elevator, an automatic door, a large restroom which can accommodate a wheelchair, a curb cut for smooth travel by a wheelchair, Braille signs around the building, and much more. In addition to building accommodations, below are services libraries can offer to improve accessibility.

Homebound Book Delivery

Home book delivery is a time-intensive but effective service for people who cannot make it to the library. Librarians or volunteers choose books of interest to the homebound on a biweekly or monthly basis and then physically deliver the books to the reader's home. They pick up the books the reader is finished with and return them to the library. Sometimes libraries require a note signed by a doctor or medical worker to verify they need the service. Since this is a time-intensive service, many libraries rely on volunteers to deliver the books. The volunteer picks the selected books up at the library and delivers them to the home of the person needing the service.

Books by Mail Service

A few libraries offer books by mail services. Some offer all the books available in the library and others have a special collection, for instance, of paperbacks which are less expensive to mail. The books are delivered to the reader via U.S. mail and returned in the same way. Many books by mail services are for people who live in rural areas and do not have access to a library. Some libraries offer books by mail to the homebound instead of relying on volunteers. The librarian selects the books for the reader and mails them with a postage paid return envelope the reader can use to return the books. Many libraries offering books by mail to the homebound require some verification from a medical doctor or agency that the individual is in need of the service.

Deposit Collections

Many libraries offer deposit collections to agencies like nursing homes, senior centers, and even day care centers. This way, residents have access to a large number of books for a certain period of time without having to visit the library. For many seniors in nursing homes and adaptive living centers, this brings the library to them.

Large Print Books

Many libraries have large print books with size 14 or 16 point or higher fonts for people with vision impairments. Large print publishing really only began as recently as 1964 in England. Although many people are eligible for the talking book program if they have problems reading regular print, many are not ready to give up reading print.

Large print books have increased in popularity and now most are published at the same time as the traditional print book. Most public libraries, even small ones, now carry large print books.

Braille Books

Some libraries have collections of Braille books for the blind. Braille is a system widely used for blind people to read and write and was invented by Louis Braille in 1821. Because of the space required for Braille, these books are very thick and one book can consist of a number of volumes. Most libraries refer the blind to the talking book program which carries a large Braille collection and is sent to readers through the mail.

Audio/Recorded Books

Many libraries offer collections of audio/recorded books in different formats for readers. These are enjoyed by everyone, not just people with disabilities. Audiobooks became popular on cassette in the 1980s and that is when public libraries started offering them. The talking book program started offering books on cassette in the 1970s to qualified readers. Audiobooks then became available on CD, and most recently as downloadables from the Internet. Readers qualified for the talking book program can supplement their book selections at the public library with different formats of audio/recorded books.

ADAPTIVE HARDWARE AND SOFTWARE FOR ADULTS

With shrinking budgets and the challenge of providing more materials in more formats, it is difficult for libraries to select which accessibility options to offer that will provide the greatest increase in accessibility to the greatest number of physically challenged library users. The majority of public libraries serve populations of under 25,000, which means many do not have professional librarians or decent budgets. Although making many services accessible can be simple and common sense, other accommodations can be expensive and cost prohibitive even for libraries who want to provide accessible materials and services. Even if grants are available, there is the problem that people with mobility and vision problems do not come to the library because they think the library does not have enough for them that is accessible. Because this population does not come to the library, the library staff thinks there is no need for the accommodations.

Another challenge for library staff is finding the latest information on adaptive software and hardware. Many states like Illinois have agencies which provide information about and access to adaptive equipment. The Illinois Assistive Technology Project has a toll-free number for

agencies and individuals with questions. The National Assistive Technology Project Partnership maintains a contact list of state offices funded by the Assistive Technology Act of 1998.

Closed-Circuit Television

Some libraries offer closed-circuit television designed for people with low vision. CCTVs can enlarge text up to 50 times and can change the color of background and print. CCTVs may be useful for the elderly or persons of any age with vision problems who come in to balance their check-book, read their bills, or to read a newspaper on their own.

Typing and Voice Recognition Software

For many with mobility impairments or arthritis, writing and typing may be impossible. There are resources that can help including check-writing guides, pencil grips, slip-on typing aids, and touch and type sticks. Voice recognition software may help those with mobility and vision problems. There have been major recent improvements in this technology. Voice recognition software used to require individual users to take a good amount of time to train the software to understand his or her own voice. Programs such as Dragon Naturally Speaking allow a user to dictate commands to the computer in order to open programs, create reports, e-mail and documents, and so forth.

Screen Reading Software

Screen reading software is used by the visually impaired to vocalize the written text on a computer screen, including the "alt" text embedded in Web pages that describes visual images and icons. It is available in a variety of synthetic voices and will read what is on a computer screen to a visually impaired user. The software will read whatever is on the screen, from windows, to word processing to Web sites.

Mouse Challenges

People with visual impairments cannot use a mouse because they cannot see the cursor. Those with mobility impairments may not be able to move the mouse effectively. Software with keystroke commands and which will work with function keys help with these challenges. There are also large mice, large track balls, switches, a head mouse, joybox, and other options.

Signing for Public Meetings

Some states require that libraries offer signing for hearing impaired patrons during public meetings. When these meetings are advertised publicly, these services must be offered. Those with hearing impairments planning to attend the

meeting notify the library a certain amount of time in advance so that the library can hire an interpreter.

TDDS and TTYS

Before the digital age, some libraries had TDDS/TTYS—telecommunications devices for the deaf. A hearing impaired person would phone the library and use a typing device to transmit information. When the library received the call from this person, they would view the message from the patron as it printed out on paper and staff would communicate with the hearing impaired user by typing back. For libraries without TDDS/TTYS, most states have a relay service which can transmit information either way for those with hearing impairments trying to communicate with the hearing population. Now, with the Internet, both populations can use communication software to talk with one another.

Talking Books

The National Library Service (NLS) for the blind and physically handicapped is a national program through the Library of Congress that offers books in Braille and audio recording for individuals who cannot comfortably read regular print because of a vision, physical, or certain learning disabilities. Most libraries offer large print and audiobooks in a variety of formats such as CD, downloadable, and Playaway. The NLS has more than 60,000 titles and provides a free cassette machine for eligible readers. More than 750,000 readers in the United States enjoy the talking book program. The NLS is moving to digital flash cartridges and downloadable digital audiobooks and has quit producing cassette machines, but it will be several years before the program is totally transitioned.

Other Digital Book Formats

The Recording for the Blind and Dyslexic continues to offer recorded textbooks for the visually impaired. Benetech developed Bookshare.org which provides print-disabled people in the United States with over 40,600 books and 150 periodicals which are converted to Braille, large print, or digital formats for text to speech audio. Originally, members had to pay a modest startup and annual registration fee for access to this rapidly growing library. Thanks to special funding from the Office of Special Education programs, memberships for schools and qualifying students is free.

Audiobooks and Playaways

Public libraries have had audiobooks on cassette since the 1980s. In the twenty-first century, the popularity of audiobooks continues to rise while the sale of print remains flat. In addition to audiobooks on cassette, libraries make them available on CD. Digital audiobooks are now available via

download through vendors like netLibrary and OverDrive. A new company called Findaway developed the Playaway in 2005 which allowed libraries to buy a self-contained audiobook. Patrons who do not want to download and then upload on to an MP3 player or mobile device can borrow a self-contained unit with digital quality and the portability of a handheld player. Again, with shrinking budgets, it is a challenge for libraries to purchase audiobooks in many formats.

Audio Description

Audio description of plays and movies for the visually impaired provides narration during places in the performance that have no dialog or sound effects. Many libraries and talking book centers offer audio described videos which can be enjoyed by the sighted and sight impaired alike. The narrative is professionally written and recorded and is not intrusive. The Illinois State Library has funded an effort by the Alliance Library System to provide audio description for historical digital images on Web sites. Without audio description, digital images are almost totally inaccessible except for metadata tags which do not fully describe an image. This effort is very much in its infancy and there are few agencies providing audio description for even a few of their images.

Outreach Efforts

Users and nonusers of your core service population who would benefit tremendously from accessibility initiatives often are difficult to identify and reach out to. Often they may be trying to use the online systems, collections, and services offered by your library, because their personal return on investment in their search for information may be better online than in person. When designing your outreach efforts to this population, use this fact to your advantage. Because many print-impaired users are extraordinarily adept at using computers and networks, use the power of the Web and the Internet to reach out to this underserved population.

Web Sites

Section 508 is a law requiring federal agencies in the United States to make electronic and information technology accessible to people with disabilities and requires organizations to comply with the standard for content accessibility outlined in the statute if they wish to do business with the federal government. There are books and training programs which should help Web designers to learn how to create accessible Web sites. There are programs like BOBBY which take a look at the coding on Web sites to make sure it is accessible and provide information on what about the site is not accessible. Yet, as Web sites contain more and more media and high-end

graphics, more Web sites are not accessible to the visually impaired. Accessibility means more and easier access for everyone, yet most sites are not accessible or easy to use.

Virtual Reference

Twenty-first century libraries are offering more and more services on the Web. Virtual Reference is no exception. In 2008, OCLC Question Point and Tutor.com are the primary services libraries use to offer Web-based chat reference services. At first, these programs required separate downloads by librarian and client and had high overhead and hardware requirements. The programs are simplified, but that does not mean they are now accessible. Several talking book libraries worked with OCLC to create an accessible VR program called InfoEyes for use by the visually impaired. Visually impaired users were able to use Question Point for e-mail questions and a Web conferencing program by Talking Communities, a company led by a visually impaired gentleman, for live chat sessions.

Web Conferencing

Again, as more and more business is conducted on the Web, the visually impaired and others with disabilities comprise a large number. Talking Communities has created an accessible Web conferencing platform which is used by talking book libraries to provide live, Web-based reference services. Online Programming for All Libraries (OPAL) uses the accessible conferencing software to provide accessible library programs of all kinds. Talking book libraries, academic and public libraries use this easy-to-use conferencing software to offer book discussions, guest lectures, training programs, and all kinds of

library programs to their patrons on the Web. Not all Web conferencing programs are accessible. Elluminate is one of the few other programs that is accessible.

CONCLUSION

Although technology improves opportunities for accessibility, many technologies create a more complex environment for a person with a disability. Libraries need to keep up as much as possible with technology or who to ask to continue to improve library services for people with disabilities.

Accreditation of Library and Information Studies Programs in the United States and Canada

Karen Lynn O'Brien

American Library Association, Chicago, Illinois, U.S.A.

Abstract

The entry details the purposes, definition, historical and operational contexts, and future prospects for accreditation of library and information studies programs by the American Library Association.

INTRODUCTION

Accreditation is a quality assurance process guided by standards, policies, and procedures. The process entails the assessment of educational quality and the continued enhancement of operations through the development and validation of standards. Accreditation is also a condition wherein an accredited status signifies that the education provided is of quality.^[1]

PURPOSE OF ACCREDITATION

Accreditation provides for quality assessment and enhancement, with quality defined as the effective utilization of resources to achieve appropriate educational objectives. The purpose of accreditation is to assure the public, members of a profession, employers, students, and the educational community that an institution or program 1) has clearly defined educationally appropriate objectives, 2) maintains conditions under which their achievement can reasonably be expected, 3) is in fact accomplishing them substantially, and 4) can be expected to continue to do so.^[2] Accreditation does not result in the ranking of programs or institutions, but rather respects the uniqueness of each, while ensuring that all meet appropriate standards.

The fundamental assumptions of accreditation are that 1) self-regulation in education is preferable and in the long run is more effective than governmental regulation (in accordance with the 10th Amendment), 2) a system of quality assurance can be effective only to the extent that it recognizes and builds upon constituent willingness to engage in the process, 3) self-regulation is possible if expectations are clear, 4) most institutions will self-regulate if it is believed that they might otherwise be identified by their peers as doing something wrong, and 5) only a few institutions deliberately engage in behavior that they know is not in the public interest.^[3]

The American Library Association (ALA) *Standards for Accreditation of Master's Programs in Library and*

Information Studies express the purpose of accreditation as protecting "the public interest" and providing guidance "for educators." The ALA "Committee [on Accreditation] offers a means of quality control in the professional staffing" for "library and information services."^[4]

CONTEXT

Accreditation is a voluntary, nongovernmental, collegial process of self-study and external review. It involves a framework of international, national, regional, vocational, specialized, and professional accrediting organizations. In the United States, there are 67 accreditors recognized as reputable by the U.S. Department of Education (USDE) or the Council for Higher Education Accreditation (CHEA) and some accreditors by both.^[5]

"Regional" and "national" organizations accredit whole institutions, while specialized and professional agencies accredit programs and free-standing institutions. These organizations, while based in the United States, may accredit institutions and programs of study outside the United States. The ALA, for instance, also accredits programs at the master's degree level in library and information studies (LIS).

ALA is recognized by the CHEA, whose requirements state that accreditors "[must maintain] appropriate and fair policies and procedures that include effective checks and balances."^[6] ALA *Accreditation Process, Policies, and Procedures*, developed by the ALA Office for Accreditation (OA) and approved by the ALA Committee on Accreditation (COA), guide the process. The OA conforms to good accreditation practice as set forth by the CHEA and the Association of Specialized and Professional Accreditors (ASPA).

As a member of the ASPA, the ALA follows the *ASPA Code of Good Practice*, which states that a member must exhibit "a system of checks and balances in its standards development and accreditation procedures. [A member must avoid] relationships and practices that would provoke

questions about its overall objectivity and integrity.”^[7] The ALA process includes appeal policies and procedures that provide a system of checks and balances to protect the integrity and fairness of the process for the institution in which programs reside.^[11]

The ALA accredits the professional degree in librarianship, established by the ALA governing council as the master’s degree. The ALA is recognized by the CHEA as the accreditor for LIS programs offered under the degree-granting authority of regionally accredited institutions located in the United States, Puerto Rico, and by agreement with the Canadian Library Association, in Canada. The ALA is one of the 20 ASPA member agencies that accredit educational entities in both in the United States and Canada.^[8] CHEA recognition requires that an accreditor undergo review every 5 years to confirm eligibility and demonstrate compliance with its standards.

The ALA falls outside the scope of the USDE recognition, which by statute does not concern itself with accreditors that do not perform a Title IV “gate-keeping role” for federal loan and grant funds. That gate-keeping role falls to the institutions in which LIS programs reside, which are regionally accredited. The ALA standards require a program in the United States to reside within a regionally accredited institution.^[4]

Canadian institutions of higher education, however, operate under provincial legislation, with older institutions likely to have an act specific to themselves. As the number of postsecondary institutions seeking degree-granting powers has increased through the 1990s to the present, provinces have devised their own mechanisms for considering these requests; for example, the Province of Alberta operates the Campus Alberta Quality Council, and Ontario has the Higher Education Quality Council of Ontario. However, while the processes for obtaining provincial approval to offer degree programs may have similarities to accreditation processes (incorporating self-studies and external reviews), the language in Canada is not that of “accreditation” of each institution.

Individual academic programs in Canada are subject to accreditation processes, as is the case with library and information science education. In recognition of cross-border mobility between the two nations, Canadian accreditation processes often recognize the American program in some way. The Canadian Medical Association accredits graduate medical education, and its accreditation committee includes two observers from the Accreditation Council for Graduate Medical Education, from the United States. The Canadian Architectural Certification Board comprises only Canadians, but acknowledges a close working relationship with NAAB (National Architectural Accrediting Board).

The COA has 12 members, stipulated by the ALA Committee on Organization as five practitioners and five academics who are ALA members, and two public-at-large members, all appointed by ALA presidents-elect. The ALA members serve a 4-year nonrenewable term,

while the public-at-large members are appointed to serve a 2-year term, renewable once.

HISTORY

The origins of accreditation are traced to the progressivism movement of the mid-nineteenth through mid-twentieth centuries, which saw the rise of higher education in the United States beginning in 1862 with the passage of the Morrill Act, which came to be known as the Land Grant College Act.^[9]

Accreditation of postsecondary education developed in parallel with library studies education. Through efforts led by Melvil Dewey, the first library school was founded in 1883 as the School of Library Economy at Columbia College (now Columbia University). Similar schools elsewhere followed, and in 1900, accreditation of library studies was born when the ALA established the Committee on Library Training that formulated the first standards of quality for library education.^[10]

The first comprehensive study of library education was undertaken in 1921 with Carnegie Corporation funding by librarian and economist Dr. Charles C. Williamson. His report *Training for Library Service* stressed the need to draw a strong distinction between professional and clerical work in libraries, recommending that library education schools require applicants to hold an undergraduate degree.^[11] It was not until 1951, however, that the master’s degree was established by ALA policy 54.2 as the professional degree.

The ALA Board of Education for Librarianship (BEL) was established in 1924 to develop “minimum standards for library programs.” The Carnegie Corporation used these quantitative training measures as a basis for endowing existing and newly formed schools, including the Graduate Library School at the University of Chicago, the first library school to offer a graduate educational program in librarianship.^[12]

As library education moved into more traditional academic contexts within university settings, the next revision of the standards in 1933 was more descriptive of the principles and practices of the profession and less prescriptive and training oriented. This revision was a cooperative effort between the BEL and the Association of American Library Schools [AALS; now the Association for Library and Information Science Education (ALISE)]. At that time, there were 25 LIS schools in the United States and Canada.

The next revision was undertaken by the BEL, the AALS, and the ALA Library Education Division and approved by the ALA Council on July 15, 1951. These standards incorporated the premise that the professional degree be a minimum of 5 years of study beyond secondary school and should lead to a master’s degree.

In 1955, the COA was established as the decision-making body for accrediting professional degree programs

in LIS. The work of the COA is administered by the OA, formerly the Office for Education. The OA also coordinates reviews of school library media teacher education programs.

The COA established a standards revision subcommittee in 1970 that produced the 1972 *Standards for Accreditation*, which notes that its requirements and recommendations emphasize “qualitative rather than quantitative considerations... and that, therefore the standards lend themselves to some variation in interpretation... The standards are indicative but not prescriptive.” The 1972 standards guided programs until the ALA Council adopted the *Standards for Accreditation of Master’s Programs in Library and Information Studies 1992*, which became effective January 1, 1993.

Between the 1972 and 1992 standards, a grant from H.W. Wilson funded the ALISE to convene a conference of 17 organizations including ALA to discuss whether the accreditation process could be broadened to provide for governance and operation through a collaborative, mutually supported mechanism.^[12] That same year, the U.S. Department of Education funded the COA to explore implementation of a collaborative accreditation structure. As a result of that exploration, the COA prepared a report *Accreditation: A Way Ahead*, released April 1986.

In 1999, members of the ALA, the ALISE, the American Association of Law Libraries, the Medical Library Association, and the Special Libraries Association convened as a steering committee for the first Congress on Professional Education (COPE I) to focus on “initial preparation for librarianship.” Their report included 30 recommendations.^[13] Following those recommendations, COA revised its process policies and procedures, including a streamlined appeals process and a policy requiring that a program be placed on conditional accreditation status before accreditation could be withdrawn. Those revisions are published as *ALA Accreditation Process Policies and Procedures*, effective December 15, 2006. New editions followed in 2012 and 2015.

In 2002, a COA subcommittee reviewed the standards, surveyed constituents, and provided a report with recommendations. That report led to a draft of proposed changes that were released for comment on November 17, 2006. A revised version of the *Standards* was approved for adoption by the ALA Council on January 15, 2008. A 5-year COA standards review (2009–2014) resulted in a revised edition approved for adoption by the ALA Council on February 2, 2015.

STANDARDS AND PROCESS

Revisions of the ALA standards over the years reflect the evolution of accreditation in general from quantitative to qualitative. The ALA standards emphasize improvement by stating that the intent of the standards is “to foster excellence through a program’s development of criteria

for evaluating effectiveness, developing and applying qualitative and quantitative measures of these criteria, analyzing data from measurements, and applying analysis to program improvement. The Standards stress innovation, and encourage programs to take an active role in and concern for future developments and growth in the field.” In each of the standards, emphasis is on a program demonstrating “how the results of evaluation are systematically used” for improvement and “plan for the future.” Programs must demonstrate use of “the results of their evaluations for broad-based, continuous program planning, development, and improvement.”^[4]

The standards define the field as “concerned with recordable information and knowledge, and the services and technologies to facilitate their management and use. Library and information studies encompasses information and knowledge creation, communication, identification, selection, acquisition, organization and description, storage and retrieval, preservation, analysis, interpretation, evaluation, synthesis, dissemination, and management.”^[4]

A 5-year review of the 2008 *Standards* conducted by the ALA COA in public discussion with stakeholders, virtually through webinar and website comment collection, and in face-to-face meetings, resulted in a revision adopted by the ALA Council on February 2, 2015, at the ALA Midwinter Meeting. The 2015 standards specify five areas for determining program quality: Standard I. Systematic Planning; Standard II. Curriculum; Standard III. Faculty; Standard IV. Students; and Standards V. Administration, Finances, and Resources.

Programs seeking initial or continued ALA accreditation status address how they are meeting the *Standards* by following the established *Accreditation Process Policies and Procedures*. A primary function of the OA is to administrate the review process. The process entails preparation of a self-study that is verified by an external review panel at least every 7 years as part of the comprehensive review process, an annual statistical report, and a biennial narrative report addressing changes since the last comprehensive review.

FUTURE PROSPECTS

Interest in accreditation as a quality assurance mechanism remains intense, especially with the ongoing development of online program delivery. Currently, 29 of the 59 institutions offering an ALA-accredited program are providing a 100% online program. Regional accreditors depend on specialized accreditors and vice versa. ALA accreditation requires programs to reside within regionally accredited institutions.

Most developed countries outside the United States rely on governmental entities such as ministries of education to assure educational quality. Visitors to the ALA and attendees at accreditation conferences from outside the United States express interest in the collegial peer-review

nongovernmental nature of accreditation as practiced in the United States. Visitors to the OA have expressed admiration of the clarity and brevity of the ALA *Standards* and the well-developed review process.

It is the self-regulatory nature of accreditation as practiced in the United States that appears to promise a greater potential for the kind of agility sought to meet demand for education on a global scale. Based on the U.S. Census Bureau Population Division International Database, the Center for Higher Education projects that global demand for higher education will continue to grow exponentially from 48 million learners in 1997 to 159 million by 2025. Programs are likely to proliferate in an effort to meet this demand, and with that, quality assurance will become all the more important.^[14]

Master of library and information studies programs in the United States and Canada continue to come forward seeking ALA accreditation. In January 2014, an eighth Canadian program was granted initial accreditation. Yet another program domestically was initially accredited in 2015 to bring the total number to 64. Two programs in the United States are currently in Candidacy status under review for initial ALA accreditation.^[15]

Acquisitions Institute at Timberline Lodge

Scott A. Smith

Langlois Public Library, Langlois, Oregon, U.S.A

Abstract

This entry describes the history and program content of the Acquisitions Institute at Timberline Lodge. The institute is an annual international library conference, held in mid-May in Oregon, focusing on issues pertaining to acquisitions, collection development, and technical services, primarily as relates to academic libraries.

DESCRIPTION OF THE ACQUISITIONS INSTITUTE AT TIMBERLINE LODGE

The Acquisitions Institute at Timberline Lodge is an annual international library conference held in mid-May at Timberline Lodge, Oregon. The conference focuses on topics relating to library acquisitions, collection development, and technical services. The scope of the institute is not, in theory, confined to any particular type of library, but in practice nearly all presenters and delegates are from academic libraries or commercial vendors who serve the academic market. Most attendees are from institutions in North America, but librarians from Africa, Australia, the Middle East, New Zealand, and South America have also attended. Although sometimes referred to as “the Timberline Institute” or “the Timberline conference,” the formal name of the meeting is “The Acquisitions Institute at Timberline Lodge.”

HISTORY AND EVOLUTION OF THE INSTITUTE

The institute has been held under two different names and in two different locations. The origins of the conference can be traced to a conversation between two librarians and a bookseller at the annual American Library Association meeting held in San Francisco in June, 1987. By then the Charleston Conference had become well established as a smaller, more focused meeting relating to acquisitions. Richard Brumley, then Head of Acquisitions at the California Polytechnic State University, San Luis Obispo; Tom Leonhardt, then Dean of Libraries at the University of the Pacific in Stockton; and Scott Alan Smith, then with Blackwell's, pondered the question as to whether acquisitions policies and procedures in the West differed from acquisitions practice in the East. The three agreed the topic was worthy of exploration and over the course of the next few years began working on what was envisioned, initially, as a one-time event.

As plans for the meeting coalesced, Leonhardt noted that the University of the Pacific had an off-site conference facility located in the Sierras known as the Feather River Inn. (The Inn was built in 1914 and acquired by the university in 1977. It was sold to a private equity company in 2005.) After initial discussions with the Inn in 1989, plans were made to hold a meeting the following May. The first Feather River Institute was held on May 18–20, 1990. The keynote speaker was Melvin Voight, University Librarian Emeritus at the University of California, San Diego. His keynote address was titled “Historical perspective on acquisitions/collection development.” Other presentation titles that first year included “Lonesome dove: doing business in the West”; “Boom or bust”; “How the West was won”; “Gunfight at the OK Corral: Holding your own with collection development”; and “Young guns: library education today” (a complete list of keynoters, presenters, and institutional affiliations is included as an appendix).

During the wrap-up session, the group agreed that in fact there is nothing unique about acquisitions in the West. The meeting was deemed productive and successful, however, and the delegates felt the idea of making this an annual event had merit. Eight more Feather River Institutes were held through 1998 (there was no conference in 1993).

In part due to the rustic and informal nature of the Inn, the Institute had a decidedly relaxed and laid-back style. Far from being unprofessional, however, this somewhat unconventional atmosphere fostered a candid and fertile environment for presentations, discussions, and debates among and between librarians, publishers, book vendors, serials agents, and others associated with the library community.

One of the unusual characteristics of the conference was the fact that, from the beginning, there were no exhibits. Nearly a third of the attendees were vendors, but they came as colleagues, not as company representatives motivated to sell product. A strict policy of “noncommercial behavior” was established early on and has been observed with but a few transgressions. Most vendors expressed genuine gratitude for the opportunity to engage

in substantive conversations on topics germane to the library world without the burden of normal conference exhibit demands.

Moreover, to the consternation of some attendees, name badges do not reflect institutional affiliation. This is deliberate; the organizers feel this helps stimulate conversations and initially break the ice.

Some of the vendors and publishers who have attended the institute over the years include Alibris, Blackwell's, Brill Academic, University of California Press, Cambridge University Press, Casalini, University of Chicago Press, Credo Reference, EBSCO, Elsevier, Gale/Cengage Learning, Harrassowitz, Innovative Interfaces, Kluwer Academic Publishers, Martinus Nijhoff, University of Minnesota Press, now publishers, Oxford University Press, Puvil, SAGE, Springer, Stanford University Press, Swets, Syndetic Solutions, Taylor & Francis, University of Washington Press, John Wiley & Sons, and YBP Library Services.

During the Feather River years, outside sponsorship for the institute was not necessary. With the move to Timberline, it was deemed appropriate to develop an ongoing network of corporate supporters; many of the aforementioned vendors have been steadfast contributors to the institute.

By 1999, the planning committee consisted of Scott Alan Smith (now library director at the Langlois Public Library, Oregon), Richard Brumley (by then Head of Acquisitions and Collection Development at Oregon State University; now retired), and Nancy Slight-Gibney (then Head of Acquisitions; now Director, Library Resource Management and Assessment, University of Oregon). For a variety of reasons, the committee decided to investigate a different venue for the conference. After considering a number of possible sites, Smith selected Timberline Lodge. The conference was renamed The Acquisitions Institute at Timberline Lodge, and the first institute at Timberline was held on May 20–23, 2000. With the exception of 2006, when no conference was held, the institute has met annually.

Prior to the move to Timberline, the conference organization had been very informal. By the time the decision to relocate had been made, it was apparent the group had outgrown its initial structure, and more traditional organizational models were considered. Today, the institute is a 501 (c) 3 nonprofit corporation, EIN 71-1001116; Oregon nonprofit corporation 361549-95.

TIMBERLINE LODGE—THE FACILITY

Timberline was built in 1936–1937 as a project of the Works Progress Administration. The lodge is sited at 6000 ft on the south slope of Mt. Hood, approximately an hour east of Portland. With the exception of six massive timber columns that came from what is now the Gifford

Pinchot National Forest on the Washington side of the Columbia Gorge, most of the building materials were gathered within a mile of the lodge.

During the depths of the Great Depression, the WPA and the Civilian Conservation Corps sought to give unemployed, desperate people a living wage and, just as importantly, a sense of self-worth and dignity. The results at Timberline are magnificent and enduring.

Gilbert Stanley Underwood, who had designed lodges at Bryce Canyon and Yosemite, was retained as consulting architect. Marjorie Hoffman Smith served as the interior designer, and Ray Neuffer supervised the woodworking shop. Under Smith's direction, workshops were established in Portland to weave cloth for the lodge; Neuffer oversaw workers who evolved into craftsmen, building unique furniture that is still in use today.

On September 28, 1937, Franklin D. and Eleanor Roosevelt visited Oregon and dedicated the Bonneville Dam and Timberline Lodge. In 1975, a conference wing was added—named the C. S. Price Wing, after one of Oregon's foremost artists and whose work is featured in the lodge. In 1977, the lodge was declared a national landmark, and in 1981 the Wy'East Day Lodge was opened to help accommodate the heavy ski, snowboard, and snowshoe traffic the facility serves year round. Today more than two million people visit the lodge every year.

THE ACQUISITIONS INSTITUTE TODAY

Smith selected Timberline as the new home for the conference because it is uniquely Oregonian, and its size and configuration readily meet the objectives of the conference. The conference planners intend to keep the meeting small. The immediacy and collegiality of the conference are values that would likely be sacrificed were the institute to grow too large.

The schedule deliberately allows time outside of the formal program to allow delegates to network. There are no breakout sessions; everyone attends all presentations together. The goal of the planning committee is to give all attendees the best conference experience possible.

Program content has evolved over the years, reflecting changes in libraries and publishing. Today the focus of many presentations is access of content rather than the acquisition and management of print collections.

THE PLANNING COMMITTEE

As of February, 2014, the Planning Committee consists of

Kristina DeShazo, Acquisitions and E-Resources Librarian, Oregon Health and Science University

Stacey Devine, Assistant Head, Acquisitions and Rapid Cataloging, Northwestern University
 Nancy Slight-Gibney, Associate Professor, Director, Library Resource Management, University of Oregon
 Scott Alan Smith, Library Director, Langlois Public Library

APPENDIX—PREVIOUS CONFERENCE PROGRAMS

Feather River Institute, May 18–20, 1990
 Conference title: Acquisitions in the West.
 Keynote address: Melvin Voight, University Librarian
 Emeritus, University of California, San Diego
 Historical perspectives on acquisitions/collection development
 Lonesome Dove: Doing business in the West.
 Adrian Alexander, The Faxon Company
 Marcia Anderson, Arizona State University
 Dana D'Andraia, University of California, Irvine
 Steve Pugh, Yankee Book Peddler
 How the West was won.
 Marion Reid, California State University, San Marcos
 Marilyn Myers, Arizona State University West Campus
 Melvin Voight, University Librarian Emeritus, University of California, San Diego
 Gunfight at the OK Corral: Holding your own with collection development.
 Henry Yaple, Whitman College
 Young guns: library education today.
 Bill Fisher, San Jose State University

Feather River Institute, May 29–June 1, 1991
 Conference title: Acquisitions conference.
 Whether it is better to be loved or feared: Librarianship as Machiavelli might have described it.
 Jan Maxwell, University of Oregon
 Personnel management: a vendor's perspective.
 Bob Mastejulia, Baker & Taylor
 Acquisitions personnel management—a librarian's perspective.
 Richard Brumley, Cal Poly, San Luis Obispo
 Toward greater objectivity: formal production standards for processing units in libraries.
 Andrew Shroyer, University of California, Santa Barbara
 Selection and development of library professionals as sales representatives.
 Adrian Alexander, The Faxon Company
 The Changing role of the library supplier.
 Don Satsky, Blackwell North America

Collection development and automation: threat or promise?
 Margo Sasse and Patricia Smith, Colorado State University
 A knowledge-based expert system application in library acquisitions: monographs.
 Pam Zager, Iowa State University
 Acquisitions or access: impact and implications of electronic publishing.
 Bill Fisher, San Jose State University

Feather River Institute, May 28–31, 1992
 (No unique conference title in 1992.)
 Haven't I seen you somewhere before?: a history of acquisitions.
 Karen Schmidt, University of Illinois, Urbana-Champaign
 Acquisitions principles and the future of acquisitions.
 Joe Barker, University of California, Berkeley
 The Tenets of acquisitions?: library acquisitions: practice and theory.
 Joyce Ogburn, Yale University
 How the Richard Abel Company changed the way we work.
 Ann O'Neill, University of North Carolina, Chapel Hill
 A Brief history of the Richard Abel Company.
 Dora Biblarz, Arizona State University
 Ethics: vendor perspectives.
 Mary Devlin, The Faxon Company
 Acquisitions ethics: the evolution of models for hard times.
 Mary Bushing, Montana State University
 Firing an old friend, painful decisions: the ethics between librarians and vendors.
 Roger Presley, Georgia State University
 Coordinating collection development in a hostile environment: the impact of reduced funding on organization for collection development.
 Wanda Dole, SUNY Stony Brook
 History of library-vendor relations since 1945.
 Bill Fisher, San Jose State University

There was no conference in 1993.

Feather River Institute, May 19–22, 1994
 Conference title: Dealing with change, or changing the deal.
 Developing a vision for acquisitions.
 Karen Schmidt, University of Illinois
 The Upside of downsizing.
 Karen Cargille, University of California, San Diego
 Peter Stevens, University of Washington
 Library organizational culture in strategic planning.
 Joe Barker, University of California, Berkeley

Postmodern acquisitions: organizing to change.

Sharon Propas, Stanford University

Darwinism in technical services: natural selection in an evolving information delivery environment.

Christian Boissonnas, Cornell University

Does TQM really help anyone?

Bill Fisher, San Jose State University

Awards from the front lines: participative recognition of peer performance.

Steve Marquardt, University of Wisconsin, Eau Claire

Academic librarians: acculturation and efficacy.

Mary Bushing, Montana State University

Case studies of ethics and business practices.

Mary Devlin, The Faxon Company

Meta Nissley, California State University, Chico

Profiling the internet: can vendors survive in cyberspace?

Stephen Pugh, Yankee Book Peddler

Rick Lugg, Yankee Book Peddler

Feather River Institute, May 18–21, 1995

Conference title: Controversies and debates in acquisitions.

The Economics of monographs acquisitions: results of a time/cost study.

Pam Rebarcak, Iowa State University

Building bridges between acquisitions and collection development: communication models for the electronic environment.

Margaret Axtmann and Barbara Stelmasik, University of Minnesota

Prioritizing firm order costs and vendor services.

Scott Alan Smith, Blackwell's

Richard Brumley, Oregon State University

Debate: Any technical services operation can sustain a 25% budget reduction without significant erosion of service.

Reorganization revisited: acquisitions as an endangered species.

Eleanor Cook, Appalachian State University

Sleeping with the enemy: the love/hate relationship between acquisitions and collection development.

Karen Cargille, University of California, San Diego

Douglas Cargille, California State University, San Diego

I Love me, I love not: schizophrenic behavior among acquisitions/collection development librarians.

Terry Allison, California State University, San Marcos

What Does acquiring require, or, Is there a librarian in the acquisitions department?

Kirk Russell, Brigham Young University

Borderline ethics and business practices: case studies.

Mary Devlin, Blackwell's

Meta Nissley, California State University, Chico

Library management: the latest fad, a dismal science, or just plain work?

Bill Fisher, San Jose State University

Debate: Consolidation of purchases with a single vendor makes good business sense - yes or no.

Feather River Institute, May 16–19, 1996

Conference title: Death and rebirth in library acquisitions.

History of forgotten library technologies.

Karen Schmidt, University of Illinois, Urbana-Champaign

When bad things happen to good vendors: lessons for librarians.

Adrian Alexander, Swets

Mike Markwith, Swets

Rearranging the universe: reengineering, reinventing, and recycling.

Sharon Propas, Stanford University

The Fugitive: gifts, exchanges, and booksellers to acquire the elusive monograph.

Tom Leonhardt, University of Oklahoma

Panel debate: Libraries are businesses.

T2: Theory in acquisitions revisited.

Joyce Ogburn, Old Dominion University

Applying serials and acquisitions skills on the "other side".

Nancy Chaffin, Arizona State University West

Realities of the team model in library technical services.

Rita Echt, Michigan State University

Evolution of acquisitions in the electronic information realm.

Chris Hector, University of Waikato

Analysis of acquisitions and collection development web pages.

Steve Johnson, Clemson University

Acqnet & Acqweb: past, present, and future.

Eleanor Cook, Appalachian State University

Feather River Institute, May 15–18, 1997

Conference title: Oh, the Change is going to do me good. . .

Library schools and library education: change agents for the profession.

Bill Fisher, San Jose State University

What's for dinner? Continuing education after the MLS.

Ann O'Neill, University of South Carolina

Unhurried change.

Larry Ostler and Terry Dahlin, Brigham Young University

Acquisitions packages and licensing agreements: changing the way we do business.

Scott Wicks, Cornell University

Licensing information: where can we go from here?

Steve Bosch, University of Arizona

Kittie Henderson, EBSCO

Brian Schottlaender, UCLA

Acquisitions and collection development in an era of full-text and package deals.

Nancy Persons, Sonoma State University

Scott Wicks, Cornell University

Changing roles, changing services: partnerships in the new information age.

Mike Markwith, Swets

Developing a relationship with your new subscription agent/understanding your new client: 1001 Thai burritos on the road to great two-way communication.

Sandy Barstow, University of Wyoming

Barbara Woodford, EBSCO

Dynamic partnerships in the library marketplace.

Kit Kennedy, Blackwell's Periodicals

Anne McKee, Blackwell's Periodicals

Got any spare change?

Ron Ray, University of the Pacific

The Books are shelf ready, are you?

Rick Lugg, Yankee Book Peddler

Albert Joy, University of Vermont

The Undead in library technical services: activities and attitudes that have exhausted their life, but which refuse to die.

Ron Ray, University of the Pacific.

Integrating solutions: examining the collection management process using OCLC's Electronic Collections Online as a model.

Elizabeth Cooley, OCLC

Chip Nilges, OCLC

Feather River Institute, May 14–17, 1998

Conference title: "As I walked through the wilderness of this world" - Acquisitions: the Pilgrim's progress.

The Five blind men and the elephant: differing perceptions of the introduction of an approval plan.

Martin Cohen, McGill University

James Galbraith, Blackwell's

Slicing the pie: implementing and living with a journal allocation formula.

Robert Sorengfrei, Colorado School of Mines

How far have we come: benchmarking time and costs for monograph purchasing.

Nancy Slight-Gibney, University of Oregon

When write is wrong: a look at the professional literature in library and information science.

Bill Fisher, San Jose State University

Publishers on the web: from Addison to Ziff.

Virginia Scheschy, University of Nevada, Reno

Who's number one: evaluating acquisitions departments.

Peter Stevens, University of Washington

Libraries and vendors working together for a change.

Keith Schmiedl, Coutts

Libraries "in Dutch": their response to the Elsevier-Kluwer merger.

Carol MacAdam, Swets

There was no conference in 1999.

The Acquisitions Institute at Timberline Lodge, May 20–23, 2000

Conference title: Acquisitions and Collection Development in the twenty-first century.

Core competencies for the acquisitions librarian.

Bill Fisher, San Jose State University

Aiming for continuous improvement: performance measurement in a re-engineered technical services.

Glenda Smith, Griffith University

Physical setting and organizational success.

Mary Ellen Kenreich, Portland State University

Consortial purchases: are they really worth it?

Deborah Carver, University of Oregon

Be careful what you wish for; or, all for nothing—nothing for all.

Julia Gammon, University of Akron

Rick Lugg, R2 Consulting

Making one size fit all: a legislative mandate for Minnesota State Colleges and Universities.

Diane Richards, Minnesota State University, Mankato

E-Journals: The OhioLINK experience.

Carol Pitts Dietrich, Ohio State University

California State University journal access core collection.

Marc Langston, California State University, Chico

There is more to OP ordering than searching the internet.

Sharon Propas, Stanford University

James Bryant, Backer-Bryant Academic Library Services

A New social contract for acquisitions and collection development.

Martin Cohen, McGill University

Book selection responsibilities for the reference librarian.

Robert Sorgenfrei, Colorado School of Mines

Christopher Hooper-Lane, Colorado School of Mines

Collection development for the digital age.

Sandra Kerbel, University of Virginia

E-Book panel discussion.

Bonnie Allen, Oregon State University

Carol Pitts Dietrich, Ohio State University

Scott Alan Smith, Blackwell's

The Acquisitions Institute at Timberline Lodge, May 19–22, 2001

Conference title: Acquisitions and collection development: The Beat goes on—cool jazz or hard rock?

Keynote address: Deregulation and the Academy:
Opportunities and strategies under the new rules
for resource gathering.

Frank D'Andraia, University of Montana

Collections and systems: a new organizational para-
digm for collection development.

John Webb, Washington State University

E-Journal databases—a long term solution?

Nathalie Schultz, Griffith University

Evolution of the supply chain in library
bookselling.

Jackie Coats, University of Washington

Matt Nauman, Blackwell's Book Services

Brian Elliott, Alibris

Jeff Dixon, Amazon.com

Robert Rooney, Taylor & Francis

E-Books, the latest word.

Bonnie Allen, Oregon State University

Len Liptak, ebrary

Katharine Phenix, netLibrary

Robert Rooney, Taylor & Francis

Accounting for access (costs and benefits).

Karen Schmidt, University of Illinois

Nancy Slight-Gibney, University of Oregon

Putting theory into practice: needs analysis.

Karen Rupp-Serrano, University of Oklahoma

Finding the right balance: campus involvement in
the collections allocation process.

Lisa German, University of Illinois

Karen Schmidt, University of Illinois

Impact of organizational structure on acquisitions
and collection development.

Bill Fisher, San Jose State University

On the nature of our business: A forum.

Richard Brumley, Oregon State University

The Acquisitions Institute at Timberline Lodge, May
18–21, 2002

Conference title: Acquisitions and collection devel-
opment on the mountain.

Keynote address: Vessels and voyagers: some
thoughts on reading and writing, books and
libraries.

Dr. Richard Hume Werking, U.S. Naval Academy

Print to electronic journal conversion: criteria for
maintaining duplicate print subscriptions.

Sandy Campbell, University of Alberta

Joint remote storage projects.

Carol MacAdam, JSTOR

The California State University E-Book pilot
project.

Marc Langston, California State University, Chico

Nancy Noda, San Francisco State University

Publishing and library bookselling: trends in pub-
lishing and information distribution.

Adam Chesler, Kluwer Academic Publishers

Matt Nauman, Blackwell's Book Services

Robert Rooney, Taylor & Francis

Jannette Schuele, YBP Library Services

Jonathan Weiss, Oxford University Press

Collection assessment: what do you do with the
data?

Peggy Cooper, Boise State University

Marita Kunkel, Oregon Institute of Technology

Faye Chadwell, University of Oregon

Electronic resources librarians.

Bill Fisher, San Jose State University

Going back to the future: Deconstructing a subject
based acquisitions structure.

Karl Debus-Lopez, University of Wisconsin

Automating selection through cataloging: workflow
redesign.

Jackie Coats, University of Washington

Joe Kiegel, University of Washington

Acquisitions and collection development in the age
of content.

Christa Easton, Stanford

Digitization projects in acquisitions.

Jackie Coats, University of Washington

Lisa Spagnolo, University of Washington

The Acquisitions Institute at Timberline Lodge, May
17–20, 2003

Conference title: Library collections and informa-
tion access: Great notion or cuckoo's nest?

Keynote address: Collection development in inter-
esting times.

Michael Gorman, California State University,
Fresno

Publishers and publishing: panel discussion.

Bonnie Allen, Moderator, Oregon State
University

Pat Soden, University of Washington Press

Laura Driussi, University of California Press

Sloane Lederer, Cambridge University Press

Amy Yodanis, Blackwell Publishing

Now you see it, now you don't.

Bill Fisher, San Jose State University

Copyright law for librarians.

Robert Ogden, Gursky & Ederer, LLP

Gearing up for the next insanely great thing: training
for new skill sets and new mindsets.

Marita Kunkel, Oregon Institute of Technology

Kit Kennedy, Swets Blackwell

External forces impacting twenty-first century
library collection development—the transforma-
tion of decision-making power.

Carolyn Henebry, University of Texas at Dallas

Ellen Safley, University of Texas at Dallas

Managing electronic resources in a time of
shrinking budgets.

Emily Miller-Francisco, Southern Oregon
University

Collection assessment: panel discussion.

- Nancy Slight-Gibney, Moderator, University of Oregon

Abstract

Africa is a continent of contrasts, comprised of 54 countries that vary in size from the expansive Sudan to small island nations. Diversity of languages and cultural traditions abound both among the nations within this second largest continent and within each nation. Each nation has diverse human populations, mineral resources, biological diversity, and political and social histories. Several have written records and libraries that date back centuries such as the Library of Alexandria in Egypt, and the Ge'ez scripts housed in the monasteries of Ethiopia and Eritrea. One possible unifying factor among the African nations, with the exception of Ethiopia and Liberia, is the legacy of colonialism, which greatly permeates life today despite independence in the 1960s. African libraries were modeled after European libraries, frequently created to serve the colonials themselves or to exert intellectual or religious control over indigenous populations. New approaches and views of African librarianship began to be articulated following the end of the colonial era, calling for a revisioning of African librarianship reflecting on the social and cultural values of Africans.

INTRODUCTION

Africa is the second largest continent, measuring approximately 5000 miles (8000 km) from north to south and approximately 4600 miles (7400 km) from east to west.^[1]

Excluding the associated dependent island nations and contested states such as Somaliland and Western Sahara, Africa comprises 54 countries, each recognized by the United Nations.^[2,3] Although the second largest continent, Africa constitutes 13.2% of the world population in the year 2000.^[4] Despite a small population density, it is an extremely diverse continent with regard to human populations, mineral resources, biological diversity, and political and social histories. Its people use approximately 2000 indigenous African languages that represent a third of the world's linguistic diversity,^[5] as well as five international or colonial languages (English, French, Portuguese, Spanish, and Arabic).

A comprehensive definition and discussion of African librarianship is therefore extremely difficult, if not impossible. For purposes here, however, the main historical events and evolving trends, perceptions, and practices that have contributed to African librarianship over time will be highlighted. The developments in the past decade that indicate new directions and paths for African librarianship will also be discussed.

AFRICAN LIBRARIES: THE HISTORICAL CONTEXT

Precolonization

The continent of Africa was home to some of the oldest libraries and collections of documents in history, The Library of Alexandria in Egypt, being the most famous example from classical antiquity. The Alexandrian Library was founded by the Ptolemies in the third century BC. While physically located on the African continent, the library was principally composed of Greek literature and was modeled on the organization of libraries in Athens.^[6] It has been argued that for the Greeks of the Ptolemaic empire, their literature represented the culture that legitimized their rule over indigenous populations of the region. Similarly, their literature united them against the Egyptians as an intellectual community.^[7] By these accounts, then, imperialism and cultural hegemony played an early role in library development on the African continent.

Early indigenous examples of African libraries include the monasteries of Ethiopia and Eritrea where Ge'ez script texts were housed and preserved for centuries. Similarly, the Mali and Songhai empires during the thirteenth to sixteenth centuries in West Africa contained resource centers with many scholarly texts. Sankoré University in

Timbuktu (in present day Mali) remained a vitally important center of higher learning during the middle ages.^[8] Another example of early African print culture is the East African history, *Kitab al-Sulwa* (known in English as *The Kilwa Chronicle*) written in Arabic by an unknown author in the early to mid-sixteenth century.^[9] While few libraries that housed print resources existed on the African continent before European penetration and colonization, the practice of oral tradition played an extremely strong and similar role to traditional print libraries across Africa for centuries. Anaba A. Alemna points out that, “There is ample evidence to indicate that oral librarianship is appropriate within the African context, given that African traditional societies did have information specialists whose official and social functions resided in the narration of local history in public places.”^[10] While libraries and graphic records were by no means strangers to the African soil before colonialism, for much of the continent, the greatest venues for the preservation and transmission of knowledge and cultural values were distinctly in the realm of oral tradition and the arts.^[11]

European Colonization and Librarianship

Despite the early examples of African libraries and librarianship mentioned above, the story of African librarianship has been heavily influenced by, and in many respects entwined with, the story of European colonization and imperialism, most particularly in sub-Saharan Africa.^[12] Apart from Ethiopia, which had only a brief occupation by Italian forces for five years from 1936 to 1941, and Liberia, founded in 1822 by the American Colonization Society (ACS) as a colony for American free blacks who elected to immigrate to Africa until it gained its independence in 1847,^[13] European colonization had a significant and enduring influence on all African nations that carried over into library development and librarianship. African colonization was carried out by Belgium, Great Britain, France, Germany, Italy, Portugal, and Spain. The apex of European colonization of Africa is represented by the Berlin Conference of 1884–1885 that effectively eliminated African self-governance and autonomy. Most African countries emerged from colonial rule in the early 1960s.

Colonial administrators and missionaries brought their European-modeled libraries with them during the period of African colonization. In some cases, these libraries were created exclusively to serve the colonials themselves, but in other cases they were used to exert a type of intellectual or religious control over the indigenous African populations. The Western-modeled libraries were stocked with materials that the colonial powers believed to be important for local populations. Indigenous knowledge and local systems of information sharing were disparaged.^[14] For many local African populations, the colonial libraries were often viewed as propaganda tools for colonial administrators.^[15] Collections in these

libraries often glorified the Western powers or denigrated the primitiveness of indigenous populations. The African libraries that sprang up during the colonial period reflected Western ideals of librarianship in multifaceted ways—in their physical facilities, their materials, and in their ideology. The colonial powers and religious missionaries believed strongly that they could import the philosophy of librarianship that had developed in Europe and the United States to the continent without modification or respect for existing models of knowledge transmission and preservation. It was essentially expected that African populations would adapt to this model of librarianship rather than libraries adapting to the needs and desires of the African populations.^[16] Western colonialists viewed the written word and the book as the pinnacle of knowledge and imposed this view on others. Colonial languages were favored and indigenous ones were dismissed. There was also no recognition that information needs might vary between communities, or between local populations and European populations. The imposition of such foreign structures resulted, for the most part, in the alienation of African communities from library services. While impressive buildings were sometimes erected to house these libraries, over time the collections and services tended to be seriously neglected.^[17] This was particularly pronounced in public and school libraries, though academic libraries were in no way immune to this situation. As the economies and stability of many African countries declined after the optimism of the 1960s and 1970s, all types of libraries suffered setbacks. Books were often in short supply as a result of the national economic situations, lack of infrastructure in the book trade, and restrictions on imports.^[18] Afeworki Paulos writes “But in general, the level of knowledge production of Africa’s cultural output remained very low in post-colonial Africa. . . Further, as early as 1980s, university libraries in Africa were in serious financial difficulty. . . In the 1980s and the 1990s, library resources in most African universities no longer met the basic needs of users. The library was marginalized in the life of the university and it led to the use of ‘alternative methods of accessing and acquiring information’.”^[14] Public libraries often housed collections that had little to no relevance to local populations while academic libraries in universities often contained outdated materials with little research value.^[16]

Independence and Postcolonization Period— African Librarianship Responds

Despite gaining independence, the majority of African countries in the early 1960s maintained dependency relationships with their former colonial powers and such influence persisted for institutions, including libraries, across the continent. African libraries continued their colonial heritage in ways that were often stifling. Even after independence, many of the pioneer librarians were expatriates

from Europe.^[16] By the 1960s, there were three dominant European languages on the continent: English, French, and Portuguese. The role and importance of libraries in those countries and cultures associated with these languages differed greatly depending on whether the African nation was colonized by Britain, France, or Portugal. Portugal, for example, had a weak library tradition itself, and this was reflected in the lack of strong library institutions in the Portuguese colonies Angola, Cape Verde, Guinea-Bissau, and Mozambique. Similarly, the French library tradition was primarily intended for the scholar and bibliophile rather than the ordinary citizen. French libraries symbolized the heritage of a civilization rather than serving as an instrument for further progress. In the former French colonies, its few libraries had hardly any qualified staff and extremely limited public access to collections of published information. Sturges and Neill have suggested however that a positive aspect of this may be that the former Francophone countries had more freedom within which to invent new responses to information needs and provisions than the former British colonies had at independence.^[19]

In contrast to France and Portugal, Britain passed on a legacy of library development that saw the library, particularly the public library, as a key component of a modern and complete nation state. Although this model of the library in the African colonial countries originally was almost exclusively racially restrictive, by the mid-twentieth century, just before independence, the library was being promoted as a means to expand literacy. The 1953 UNESCO Seminar at Ibadan, Nigeria, was an important turning point in library development serving as the affirmation of the belief that the expansion of public libraries in Africa would help increase literacy. Of the 29 participants, however, only eight were Africans. Also significant, several of the participants were not librarians but had other interests with regard to literacy and illiteracy. One tangible result of this seminar was the establishment of the West African Library Association. Another recommendation was the adoption of the UNESCO Public Library Manifesto that called for the public library to be a democratic institution, open for free and equal use by all members of the community. This would become the basis on which national public library service should be built in Africa. At the time of the seminar and adoption of the manifesto, public library service in Africa differed widely in achieving its ideals.^[20]

The Anglo-American library tradition that was embodied in the UNESCO Manifesto had an effect on libraries throughout Africa after the UNESCO Seminar, particularly in the Anglophone countries. This tradition had firmly placed national library services as the foundation for all library services. However, there was limited success in providing what many would expect of a national library in terms of a national legal deposit collection, national bibliography, interlibrary loan services, and other cooperative programs. Instead, national libraries have

generally functioned as a centralized national public library service coordinating regional branches and postal loans or mobile libraries in some locations, and to mixed degrees of success. In contrast to these public libraries, the special library sector in Africa has been stronger and longer established. These include geological, agricultural, and other special libraries tied to government ministries, NGOs, and parastatals. Similar to public libraries, academic libraries were in a relatively weak state at the time of independence. The majority of academic libraries were established after the Second World War during a period of significant expansion in African educational efforts. Despite this expansion, the library was often placed in a central location, both physically and in the rhetoric espoused by these new African universities, the reality was that a great majority of these institutions could not afford to keep up a high-quality library collection to support teaching and research.^[21] This had, and continues to have, a serious impact, on scholarship and teaching in most African countries.

In spite of the imposition and primarily negative legacy left by the colonial powers on library development in Africa, new approaches and views of African librarianship began to be proposed and articulated following the end of the colonial era in the 1960s. These views occasionally came from Europeans themselves though the majority of the calls for change came from within the continent. For example, one early European promoter of a revisioning of African librarianship came from Ronald Benge who fleshed out his ideas in his book *Cultural Crisis and Libraries in the Third World* after recognizing that Africa had its own social and cultural values and that librarianship in Africa should reflect and build on these values rather than simply following European models of the profession.^[22]

Many African librarians also took up this cause. One of the strongest examples of this anticolonial call for a nonhegemonic library tradition can be found in Adolphe Amadi's book *African Libraries: Western Tradition and Colonial Brainwashing* published in 1981. Amadi detailed the negative effects and history of the colonial influence on African libraries and called for a radically different approach to information provision.^[23] Another key contributor in this area was Kingo J. Mchombu whose article "On the Librarianship of Poverty" published in 1982, made the case that the conditions of poverty must be addressed in any discussion of information work in underdeveloped countries. In this way, Mchombu directed concerns in African librarianship to neglected populations living in the rural areas. He elaborated four principles that he saw as being necessary to make information work socially relevant in African countries:

1. That the chief factor determining information work in developing countries should be poverty rather than affluence.

2. That information work in developing countries differs markedly from information work in developed countries.
3. That it is possible to gather a body of knowledge on how best to meet this challenge.
4. That information workers must play an active role in the process of socioeconomic development.^[24]

Mchombu's piece became a rallying cry for a whole generation of African librarians (and some of their European allies) who accepted his challenge to produce a new library and information model for Africa, particularly among rural communities. Mchombu argued that information services in developing countries should not blindly follow those of developed countries and that information workers need to develop an aggressive attitude and participate fully in the social struggle for national development. Mchombu concluded, unequivocally, "...Information workers must look for solutions to their problems within their own societies rather than depending on foreign aid."^[25] During the second half of the twentieth century, many African librarians and information scholars carried forth Mchombu's challenge in a variety of ways. Some focused their efforts on the need for greater research on community needs and existing patterns of information transfer. Others examined ways that information services could repackage information into forms that were more culturally and socially acceptable by local populations. Others emphasized the importance of utilizing the oral tradition itself as an information resource within African libraries and the issues of availability of resources in local African languages. Related to this, many stressed the importance of recognizing the information needs and abilities of nonliterate.^[26] By the closing of the twentieth century, there were many voices from within Africa as well as some from outside that had articulated, researched, and written about a substantial reordering of priorities for African librarianship than those presented in the model that had been imposed on the continent by the colonial powers.

Liberalization of Higher Education in Africa and Its Impact on Libraries

Liberalization of higher education, beginning in the 1990s, had a significant impact on higher education and on libraries within those institutions of higher education. Damtew Teferra noted, "The number of institutions in sub-Saharan Africa has increased from half a dozen in the 1960s—when most of the nations in the sub-region declared independence—to over 300 in 2003."^[27] The total of institutions of higher education that grant four-year undergraduate and/or postgraduate degrees and that are officially recognized, licensed, or accredited by national or regional bodies in 2013 number over 600.^[28] This rapid growth placed a heavy burden on the nations involved since these states provided upward of 90% of support for

the education of qualified students.^[29] Paul Tiyaambe Zeleza and Adebayo Olukoshi note that the "liberalization of African Universities has increasingly manifested itself in the growth of private universities and the privatization of programmes and funding sources."^[30] Mahlubi Mabizela further reflects on the effects of global pressures, "The contemporary or new generation private HE is largely a direct consequence of the hegemonic neo-capitalist and neo-liberal post cold war social context."^[31]

Public or private, this growth in the number of institutions of higher education has placed both added challenges and opportunities for the libraries serving those institutions. Budget cuts curtailed the acquisition of journals, core textbooks, and encyclopedias in a number of libraries, acknowledged the Association of African Universities.^[32] Furthermore, Muyoyeta Simui states, "Inadequate funding for the purchase of new books and subscriptions to journals and other information resources rank amongst the most severe obstacles faced by African university libraries."^[33] According to Simui, factors affecting funding range from "growing populations exerting new and expanded demands on government, debt burden, structural adjustment programmes whose conditions are unfavourable to social services like education to changes in government policy."^[34] ICT (Information and Communication Technologies) has the potential to be the great equalizer as the continent adopts these technologies. Teferra cites L.A. Levey in stating, "despite numerous hurdles, the major factor that catalyzed the development of ICT in the continent (especially e-mail) was the great thirst and enormous need for academic and scholarly communication in the land of forbidding cost and extremely poor communication services."^[35] Libraries are responding to these challenges through consortia, use of open source products, and the promotion, use, and creation of open access (OA) journals and directories, all of which are discussed below. One library that exemplifies the modern African university library and the possibilities for these challenges to be overcome is Kenyatta University in Nairobi.^[36] Services provided by the library include a robust online catalogue (KOHA, Open Source Integrated Library Management software), institutional repository, e-books, electronic journals, chat reference, a full complement of professional staffing, adaptive technology, 370,000 volumes of books and bound periodicals, current journals, audio visual magazines and dailies, and 74 computers for student use. The library is a member of the following organizations: Kenya Library and Information Services Consortium (KLISC) and the Kenya Library Association (KLA).^[37]

NEW DEVELOPMENTS IN AFRICAN LIBRARIANSHIP

Several new developments since the end of the twentieth century and the beginning of the twenty-first century have

influenced visions for a new way forward for African librarianship. These new visions revolve around the themes of unity, pan-African responses, and a revisioning and redefining of information ethics and Library and Information Science (LIS) education for the African context.

Pan-African Responses: African Library Summits and Emergence of New Organizations

Beginning in the late twentieth century, a greater effort was being made to have a pan-African response to library and information challenges in Africa. One such example of this is the biennial conference of the Standing Conference of Eastern, Central and Southern African Library and Information Associations (SCECSAL). SCECSAL derived its origins from the East African Library Association (EALA), which was founded in 1957. When the EALA dissolved in 1970, members agreed to continue to hold a biennial conference and invited other countries in the subregion. SCECSAL is now one of the largest and fastest growing library and information professional associations in Africa. Membership to SCECSAL is open to national library and information associations from the following countries: Angola, Botswana, Burundi, Congo Republic, Democratic Republic of Congo, Djibouti, Eritrea, Ethiopia, Kenya, Lesotho, Malawi, Madagascar, Mauritius, Mozambique, Namibia, Rwanda, Seychelles, Somalia, South Africa, South Sudan, Sudan, Swaziland, Tanzania, Uganda, Zambia, and Zimbabwe. The first SCECSAL conference was held in Dar es Salaam, Tanzania, in 1974. There have since been a total of 20 SCECSAL conferences to date, which have rotated within the countries represented in the organization. Themes of SCECSAL conferences have included a wide range of topics from “Enhancing democracy and good governance through effective information and knowledge services” to “From Africa to the World—the globalization of indigenous knowledge systems.”^[38]

Given the nature of shared commonalities, histories, and challenges in African librarianship, attempts at continent-wide solutions and attempts at unified pan-African LIS have been growing. A major development in this area has been three all-African LIS summits. The first was the African Library Summit held in Muldersdrift, Gauteng, South Africa, from May 11 to 13, 2011. The theme of the conference was “The Future of African Librarianship.” The summit was hosted by the University of South Africa (UNISA) Library, the IFLA (International Federation of Library Associations and Institutions) Regional Office for Africa, and the IFLA Africa Section.^[39] The summit brought together 158 LIS policy makers, senior managers, educators, and researchers from 24 African countries and four countries outside Africa. During the deliberations, participants compiled thematic frameworks for the future of African library development. The summit delegates

recommended that a task team investigate forming a continental African Library Association or a Federation of African Library Associations, and that national library associations establish chartering bodies to regulate and accredit the LIS profession and education programs. Issues of indigenization versus internationalization of LIS education and curricula were also debated and discussed.^[40]

Following the first African Library Summit, the African Public Libraries Summit was held in Johannesburg, South Africa, September 19–21, 2012. This summit, intended solely for the public library sector, was organized around the theme “Informing Africa, Developing Africa” and was funded by the Bill & Melinda Gates Foundation and IFLA. This summit was a direct result of the first African Library Summit where a framework for public libraries had been discussed and developed. Its framework encouraged public libraries to “...examine the broadest context and develop strategies to reach the underserved and disadvantaged. They should innovate and provide a wide range of services. Public libraries should be open, flexible, multipurpose community spaces. They should add value, tap into opportunities through one voice in Africa and aggressively align and advocate within Government strategies to participate within the national development process.”^[41] In addition to public library directors and decision makers from 44 African countries and 8 countries outside the continent, the summit was also attended by government ministers, permanent secretaries, director generals, members of the African Union Commission, United Nations Economic Commission for Africa, and a variety of other commission members and development practitioners and researchers.^[42] The summit was much more of a “think tank” environment than a traditional academic conference.

Following the African Public Libraries Summit, a second African Library Summit was held in Pretoria, South Africa, July 2–5, 2013. This time the theme was “The Horizon and Beyond.” This second all-continent, all-sectors, summit was hosted by the UNISA Library, the IFLA Regional Office for Africa, and the IFLA Africa Section.^[43] This second summit attracted 280 participants from 35 countries representing greater participation from across Africa than that of the first summit. The three days of the summit focused on the themes of leadership, innovation, and cooperation. In addition to common sessions, breakout sessions took place in which more focused conversations and planning occurred by sector and topic including African library associations; training of LIS practitioners; public and community information practitioners; school libraries; academic, research, and special libraries; and LIS in Francophone Africa and Lusophone Africa. The conclusion of the summit saw the launch of three important new initiatives: the African Library and Information Association and Institutions (AFLIA), the Public Library Network, and the Conference of African National Libraries (CANL).

AfLIA's vision is to be the association of choice for strategic growth of the library and information profession in Africa, while its mission is to be the trusted African voice for the library and information community and to drive equitable access in information and knowledge for all. AfLIA's membership currently does not include an option for individuals but rather it is an organization that represents other associations or institutions from across the continent.^[44] Similarly, the Public Library Network is an effort to assist the public library community in Africa by expanding on the networking and knowledge sharing that occurred at the Public Library Summit. It is also intended to enable African public librarians to push for the placement of public libraries firmly on the development agenda with a unified voice.^[45] And finally, the CANL emerged as an independent organization of chief executives of national libraries. Its goals are to facilitate discussion and promote understanding and cooperation on matters of common interest across the continent; facilitate the exchange of information, training opportunities, sharing of resources, experiences, and expertise and promoting research; improve regional cooperation and visibility; set standards against which performance can be measured; be a representative body, recognized at national, regional, continental, and international levels; provide guidelines whenever needed; enable and promote communication; and reach out to countries without national libraries.^[46]

The three all-Africa summits have been an important step in moving African librarianship forward into the twenty-first century with a pan-African strategy for improving information provision and adapting libraries to the specific needs of African communities and contexts. What remains to be seen is if these efforts can truly be pan-African in scope. While there was representation from Francophone and Lusophone countries at the three summits, the vast majority of participants were from the Anglophone regions of Africa. Unless this changes, the countries that were former colonies of France and Portugal may continue to lag behind the rest of Africa in terms of strengthened libraries, library associations, and professional development opportunities in the LIS field.

Information Communication Technology

Improved access to ICTs, including mobile-cellular phones, has made a substantial impact on information access and provision worldwide, and Africa is no exception. Despite this, Africa lags behind the rest of the world in a number of areas. Estimated mobile-cellular penetration in Africa in 2013 was 63% compared to developing countries overall (89%) and developed countries (128%). Similarly, in 2013, Africa had the lowest Internet penetration rate at 16%, only half the penetration rate of Asia and the Pacific and far below the Americas and Europe. An estimated 7% of households in Africa had Internet access

in 2013. In Africa, as in other developing areas, fixed-broadband services continue to be extremely expensive, accounting for 30.1% of average monthly incomes. There was a substantial gap in fixed-broadband penetration rates with less than 1% in Sub-Saharan Africa compared to 27.2% in developed countries. Although mobile broadband penetration was also lower in Africa in 2013 at 11% than in other parts of the world, Africa is the region with the highest growth rates over the past three years in this arena. While mobile broadband is considerably cheaper than fixed-broadband services, mobile broadband services remain prohibitively expensive in Africa where the price of a computer-based plan with 1 GB of data volume is on average 50% of gross national income per capita.^[47]

Scholarly Publishing

Due to these ICT issues and the traditionally high cost of access to peer-reviewed scholarship in journals and databases, researchers in Africa and other developing countries have been least able to pay to access vital scientific information. Additionally, research output from Africa has had a very difficult time reaching an international audience. Both of these results have had a significant and damaging impact on the progression of scientific and scholarly progress on the continent.^[48] Starting in the 1990s, several initiatives began that were designed to increase the availability of scholarly information in Africa and thus address the deteriorating situation in which most African institutions and researchers were finding themselves. These projects were primarily driven and funded by donors and nongovernmental or nonprofit institutions. Some examples of these programs are the Programme for the Enhancement of Research Information (PERI) from the International Network for the Availability of Scientific Publications (INASP), Electronic Information for Libraries (EIFL), JSTOR's Africa Access Initiative, The Essential Electronic Agricultural Library (TEEAL) from Cornell University, and projects related to the United Nations such as the Health InterNetwork Access to Research Initiative (HINARI), Access to Global Online Research in Agriculture (AGORA), and Online Access to Research in the Environment (OARE).^[49] While most of these efforts have primarily been focused on increasing the flow of scholarly and scientific information from outside Africa to the continent, there have also been efforts to reverse this information flow and promote the publications and research output of African researchers and institutions to the rest of the world. Examples of this include NISC in South Africa, a bibliographic database publishing company that compiles licenses and aggregates bibliographic databases with a mission to promote the publications and research output of Africa. Another example is African Journals Online (AJOL), a nonprofit organization whose mandate is to promote access to African research output and support African scholarly publishing.^[50]

Open Access Initiatives: Open Access Journals and Institutional Repositories

OA initiatives have also been seen as a potential leveling mechanism through which African scholars and institutions may gain much needed access to scholarly publications and may broaden their reach with their own research outputs. OA literature has been defined as “digital, online, free of charge, and free of most copyright and licensing restrictions.”^[51] OA literature is also subject to the same rigorous peer-review process as traditionally published scholarly literature. Proponents of OA recognize the importance of the flow of scientific literature for human development. While several different economic models have developed for covering the costs of OA literature production, it is relatively common for OA publishers to charge article processing charges (APCs) for the articles that are selected after the peer-review process. This has the potential to continue the imbalances between developed and developing countries in the process of scholarly dissemination. For that reason, many OA publishers, such as BioMed Central, support research output from developing countries by providing automatic waivers for APCs for all research published from low-income or lower-middle-income countries.^[48] Not only are African scholars publishing in OA journals published in other parts of the world, they are also creating their own OA publications. These are being created and published on a number of different platforms. Some are created using Open Journal Systems (OJS), an open source software for the management of peer-reviewed academic journals created by the Public Knowledge Project.^[52] Additionally, many OA journals have been created using the AJOL system which provides free hosting for over 400 peer-reviewed journals from 30 African countries.^[53] Other platforms include AOSIS Open Journals (formerly known as OpenJournals Publishing), which utilizes the OJS system, and South African Bibliographic and Information Network (Sabinet) Open Access Collection.^[54,55]

African higher education institutions are also getting increasingly involved in the creation of OA institutional repositories, which are a significant and important development as an alternative OA route (the so-called green road of OA) designed to help disseminate scholarship from the continent to the larger scientific community. Similarly, digitization projects have gained momentum across the continent, which are helping to preserve rare and unique documents and collections. The software most commonly used in African countries for both these initiatives, institutional repositories and digital preservation projects, is the DSpace software, an open source product.^[56]

Open Source Initiatives

Another outcome of improved access to ICTs is the increase in library automation, oftentimes replacing card

catalogues with open source products. Open source software is software that can be freely used, changed, and shared. Many people can contribute to the development of the software, and it is distributed under licenses that comply with the Open Source Definition.^[57] Open source software provides an inexpensive alternative to commercial solutions. Source code is available to libraries and can be modified or developed to the library's needs. Implementation costs are also more affordable than commercial software products. Open source products do require technical expertise to operate and maintain requiring skilled professionals in house.^[58] Koha has been adopted by a number of libraries including Rwanda National Public Library, Strathmore University Library (Kenya), Addis Ababa University Libraries (Ethiopia), and Bibliothèque de l'Université de Kinshasa Bibliothèque Centrale (Congo).^[59]

Consortiums and Networks

As African libraries become more automated, there are increased opportunities for resource sharing through the development of consortiums and consortial agreements and through networks. Typically, consortia are formed of similar types of organizations to meet a common end, be it resource sharing, a common project such as a unified catalogue, collaborative purchasing, or the sharing of expertise. Ngozi Blessing Ossai, Delta State University in Nigeria, states “Globally, the development of new technologies with a concomitant exponential increase in the amount of information available has made the building and expansion of library consortia an imperative.”^[60] Sabinet, a private company since 1996,^[61] was established as a nonprofit network in 1983. It is an aggregator of southern African publications as well as providing access to South African Union. It provides access to African Electronic Journals (SA ePublications), South African Union Catalogue (SACat), South African National Bibliography (SANB), Index to South African Periodicals (ISAP), the Union Catalogue for Theses and Dissertations (UCTD), and African Digital Repository.^[62] Library consortiums served by Sabinet include SANLiC—South African National Library and Information Consortium (SANLiC) NPC, CALICO—Cape Library Consortium, SEALS—South East Academic Library System, and ESAL—Eastern Seaboard Alliance of Libraries.^[63]

Of the 200 participating consortia in ICOLC (International Coalition of Library Consortia), two are from Africa: Consortium of Ethiopian Academic and Research Libraries and the SANLiC.^[64] The EIFL, founded in 1999, partners with libraries and library consortia in more than 60 developing and transitioning countries in Africa, Asia, Europe, and Latin America.^[65] Of the 23 African nations listed, 17 have consortia including Botswana, Cameroon,

Egypt, Ethiopia, Ghana, Kenya, Lesotho, Malawi, Mali, Nigeria, Senegal, Sudan, Swaziland, Tanzania, Uganda, Zambia, and Zimbabwe.^[66]

Privately Funded Public Libraries

The scarcity of publicly funded libraries has given rise to social entrepreneurs who give up both time and capital to build libraries and develop programs. Two such endeavors include the Busia Community Library and its partner organization, Maria's Libraries (Kenya), and the Axumite Heritage Library in historic Axum, Ethiopia. The Busia Community Library is the 1988 vision of community leader Maria Wafula and serves a population of 500,000 along the Kenya-Uganda border.^[67] In 2008, it formally affiliated with the new umbrella library network, Maria's Libraries.

The Axumite Heritage Library is a project of the Axumite Heritage Foundation, a subsidiary of the Ethiopian Community Development Council (ECDC). The library is housed in the former Governor's palace (the *'Inda Nebri'id*) in Axum, Ethiopia, and opened its doors as a temporary facility in 2002. The Axumite Heritage Foundation was established to oversee the creation of the new Axumite Heritage Library, the museum, and eventually the Institute of Axumite Studies. The construction of a permanent facility is nearby on the ground of the former Governor's palace.^[68]

Innovative Outreach to Rural Communities

Scarcity of library services in rural areas has resulted in innovative outreach to members of the community. These include the use of camels for transportation of materials in Kenya,^[69] cloth pocket libraries in Ethiopia,^[70] bicycles in Kenya,^[71] and Kindles in Ghana, Kenya, Malawi, Rwanda, Tanzania, and Uganda.^[72]

Growth and Changes in Library and Information Science Education

The original training of professional librarians in Africa took place primarily overseas in institutions located in the former colonial powers or through correspondence courses from those same countries and was often criticized for being too remote from the reality of the African geographic, cultural, social, economic, and political environment. African countries began to develop library education programs of their own to meet their own needs for professional training and to counter some of these criticisms.^[73] With the exception of South Africa, which began LIS education as early as 1938, the majority of LIS programs only began to develop in the 1960s.^[74] The first was the Institute of Librarianship at Ibadan University followed by the Library School in Accra. Shortly afterward, regional library schools were

founded such as those in Dakar, Senegal, for Franco-phone Africa and the East African School of Librarianship at Makerere University in Uganda, which was designed to cater to Eastern African countries.^[73] Today, the majority of African countries have at least one library school or training program, and several countries (such as Kenya, Nigeria, and South Africa) have multiple schools for LIS education. While there has been great expansion in access to LIS education since independence from the colonial powers, a fair amount of recent reflection on the aims, quality, and relevance of LIS programs in Africa has been occurring, particularly since the turn of the twenty-first century. While a plethora of research publications and sessions at the pan-African conferences mentioned above give testimony to the fact that collaboration and a unified vision and standards for LIS education in Africa are strongly desired, substantial disparities between programs and countries exist. For example, although students and faculty across the continent have a strong desire to learn and use ICTs in their LIS educational programs, LIS institutions in South Africa have a much greater capacity and are more effective at exploiting ICTs in their programs than other countries in sub-Saharan Africa.^[75]

CONCLUSION

African librarianship has evolved significantly since the postcolonial era beginning in the mid-twentieth century when it was conceived as a distinctly different type of librarianship with unique perspectives, challenges, and needs. As Kingo Mchombu articulated toward the end of the second African Library Summit in 2013, African librarianship is not a static phenomenon, rather, it is one that has been changing over many years. While the idea of the "barefoot librarian" who worked in African villages, received an honorarium for homegrown library and information work, and participated in literacy work (among other services) was put forward by Mchombu and other African librarians in the 1970s and 1980s, he noted that that concept was a particular response to the information and political environment of the time. Although these environments and landscapes have now changed, the role of the library as a tool for human development and elevation is just as important in the African context as it was in the immediate postcolonial period. However, Mchombu has pointed out that the relationship between African librarianship and emerging technologies is now of great interest, importance, and challenges. African libraries and librarians cannot afford to ignore the new challenges brought about by increasing ICTs. The primary challenge is how to make the technology work for African communities and libraries rather than allowing those same communities to be overpowered and devoured by such technologies. The

ongoing question to be negotiated in African librarianship is how to use ICT as enabling tools without these same technologies becoming “the master” that disregards the unique needs and environment in which the majority of African populations live. As Mchombu stated, “African society is changing rapidly as well, which we must take full advantage of. The stakes are much higher now. Failure is not an option but we must realize we are riding the tiger—we cannot afford to get down and there’s no way back.”^[76] The future and precise meaning of African librarianship is being written and revised, daily, across the continent.

Altmetrics

Richard Cave

Formerly at the Public Library of Science, San Francisco, California, U.S.A.

Abstract

Altmetrics provide a new way to measure the impact of research. New channels of evaluation for scholarly work have become available by tracking its activity through usage, captures, mentions, social media, and citations. This allows researchers to gain a faster, broader picture of research as it is viewed, shared, and critiqued.

INTRODUCTION

Traditionally, citations in scholarly literature were used as a proxy to establish the quality of scholarly output with higher citation counts generally interpreted to represent higher scientific impact of the scholarly output. Used in this way, citations have limitations in that they are a substitution for quality and that they can be influenced by superficial factors. The Journal Impact Factor (IF) is another way frequently used to judge the impact of scholarly output, as it counts the average number of citations to recent articles published in a journal. But the Journal Impact Factor is highly controversial as it has a number of limitations such as skewed distributions within journals and manipulation by a journal's editorial policy.^[1] There is a need to assess research on its merits rather than on the basis of the journal in which it is published.

Altmetrics was a response to the limitations of these traditional metrics. As the volume of academic literature has exploded in the past decade, citation counts are not sufficient for measuring the impact of research. Given the large amount of online sharing of research articles and the discussions on the web about research, there are new ways to filter science for importance. Altmetrics provide a way to measure scientific impact through the conversations, bookmarks, and shares happening daily on websites around the world.

According to the Altmetrics Manifesto, "altmetrics is the creation and study of new metrics based on the Social Web for analyzing and, information scholarship."^[2] The term "altmetrics" was coined by Jason Priem, a graduate student at the School of Information and Library Science at University of North Carolina-Chapel Hill. Altmetrics is also a general-purpose term for "alternative metrics" (Fig. 1).

THE USE OF ALTMETRICS

The use of altmetrics aims to capture a broader view of scholarly research by tracking the activity of this research

as it is viewed, shared, critiqued, cited, and built upon. Some metrics are primarily used to track scholarly activity, while other metrics are used to show the public interest in scholarly research. Altmetrics measures not just articles but datasets, code, blogs, comments, and "nanopublications."

Altmetrics are gathered from a number of sources through public APIs. The data that is gathered is generated more rapidly than traditional metrics such as citations, so researchers do not have to wait years to show their worth. By providing this information, altmetrics can be used to show the impact of scientific research not just by researchers through citations but also the impact of the research to the public through the Social Web.

As outlined in "Overview of the Altmetrics Landscape,"^[3] altmetrics are generally categorized in the following ways:

- *Usage:* The measurement of the use of a research object. This includes the number of HTML views of an article on a publisher's website, the number of times that the article PDF and XML have been downloaded, and how many times its supplemental data has been accessed.
- *Captures:* The number of times an article has been stored as a bookmark or in a reference library. This includes how often an article has been bookmarked on CiteULike and how many times an article has been shared on Mendeley readers/groups.
- *Mentions:* The discussions about a research article. This includes blog posts, news stories, Wikipedia articles, comments, and reviews about a research article.
- *Social Media:* The use of an article in the Social Web. This includes tweets about an article, the number of Facebook likes, and how many times an article has been shared on social networks such as LinkedIn.
- *Citations:* The number of citations to an article that shows the long-term contribution of an article to scholarly literatures. This includes article citations from Scopus, CrossRef, and Pubmed Central (Fig. 2).

Source: Altmetric.com 2013. Reprinted with permission.

Altmetrics can be customized to address the needs of researchers, publishers, institutional decision-makers, and funders. Researchers can track the impact of their research, filter research to their individual needs, and share the research with others. They can use altmetrics to show the impact of their scholarly output beyond a journal's impact factor. Research institutions can access up-to-date metrics on the research published by their faculty members and use this information for tenure and promotion decisions. Publishers can gain an understanding on how their publications are accessed and distributed. Funders can effectively track the impact of their grant awardees and measure the wider engagement of the research that they funded.

The altmetrics movement builds on previous work by other researchers. Johan Bollen has studied usage on articles for over a decade. He started MESUR (<http://mesur.informatics.indiana.edu/>) in 2006 as a large-scale usage data collection for scientific research. The MESUR database currently contains over one billion article-level usage events obtained from publishers, institutions, and aggregators.^[4] Eigenfactor is a rating of the total importance of a scientific journal. It was created in 2007 by Jevin West and Carl Bergstrom of the University of Washington as an academic research project to rank journals based on a vast network of citations.^[5]

There are a number of organizations already collecting altmetrics and aggregating the data including ImpactStory (<http://impactstory.org/>), Mendeley (<http://www.mendeley.com/>), Altmetric (<http://www.altmetric.com/>), Plum Analytics (<http://www.plumanalytics.com/>), and Public Library of Science (PLOS) (<http://article-level-metrics.plos.org>).

Fig. 3 PLOS Article-Level Metrics displaying the usage statistics, the number of citations, the number of bookmarks, the discussions, and the recommendations for an article.

Source: Creative Commons Attribution License 3.0 PLOS 2013. As shown on the article "Why Most Published Research Findings Are False." Reprinted with permission.

Publishers of scientific research have enabled altmetrics on their articles, open source applications are available for platforms to display altmetrics on scientific research, and subscription models have been created that provide altmetrics. There are also a number of applications using altmetrics, including ReaderMeter (<http://readermeter.org/>), PeerEvaluation (<http://www.peerevaluation.org/>), Research Scorecard (<http://researchscorecard.com/>), and PLOS Article-Level Metric (ALM) Reports (<http://almreports.plos.org/>).

Altmetrics are sometimes conflated with ALMs. ALMs are an attempt to measure impact at the article level. ALMs include many of the same data points as altmetrics but also include usage statistics and traditional metrics such as the number of citations to an article. ALMs are typically associated with the publisher PLOS, who introduced ALMs on all PLOS articles in 2009^[6] (Fig. 3).

CONCLUSION

Altmetrics provide a way for researchers to measure the impact of research by tracking its activity through usage, captures, mentions, social media, and citations. Altmetrics can be customized for use by researchers, publishers, institutional decision-makers, and funders. Altmetrics can also be used to understand a researcher's influence beyond a journal's impact factor. A handful of companies have

started to collect and aggregate altmetrics and a number of publishers have enabled altmetrics on their articles. The idea of altmetrics has recently gained a lot of traction, but there is still work to be done to promote the use of altmetrics to measure scholarly impact. Altmetrics will continue to evolve along with the ways that the scholarly community views, shares, and critiques scholarly activity.

American Association of Law Libraries (AALL)

Kate Hagan

American Association of Law Libraries, Chicago, Illinois, U.S.A.

Abstract

The American Association of Law Libraries (AALL) was founded in 1906 by a group of 24 law librarians who heeded the call of A.J. Small (Curator, Law Department of the Iowa State Law Library) to form a national organization to create a professional identity for those who dealt with the burgeoning body of legal publications.

That first meeting brought together participants from state libraries, bar associations, and law school libraries, among others. Diversity among venues for the profession continues to infuse and strengthen the association, which had grown to 5041 members by September 30, 2007. This entry focuses on the recent history and the state of the organization. For a detailed review of AALL's founding and history, see earlier editions of the *Encyclopedia of Library and Information Science*, which cover the period from AALL's founding through the late 1990s, or the chronology in the *AALL Directory and Handbook*, which is updated yearly.

INTRODUCTION

The American Association of Law Libraries (AALL) was founded in 1906 by a group of 24 law librarians who heeded the call of A.J. Small (Curator, Law Department of the Iowa State Law Library) to form a national organization to create a professional identity for those who dealt with the burgeoning body of legal publications.

That first meeting brought together participants from state libraries, bar associations, and law school libraries, among others. Diversity among venues for the profession continues to infuse and strengthen the association, which had grown to number 5041 members by the year 2007.

This entry focuses on the recent history and the state of the organization and the profession. For a detailed review of AALL's founding and history, see the first edition of the *Encyclopedia of Library and Information Science*, which covers the period from AALL's founding to the late 1960s. For a detailed review of AALL at the turn of the new century, see the second edition of the *Encyclopedia of Library and Information Science*, or the chronology in the *AALL Directory and Handbook*, which is updated yearly.

AALL MISSION AND VISION

Since its founding in 1906 and later incorporation in 1935, AALL has been a leader in promoting the value of law libraries, fostering the profession of law librarianship, and providing leadership in the field of legal information and policy. Since 1990, AALL and law librarians have become even more vocal, more visible, and more effective in representing their needs and interests beyond the profession itself.

Members are AALL's core and set its priorities. The current 15-member staff handles administration and carries out the directives of the membership. William H. Jepson was appointed the first executive director in 1981, followed by Judith Genesen in 1989, Roger H. Parent in 1993, Susan E. Fox in 2003, and Kate Hagan in 2007.

AALL 2005–2010 Strategic Directions

In July 2005, the AALL Executive Board adopted a new strategic plan (called "Strategic Directions") for the years 2005–2010 at the Annual Meeting in San Antonio. These strategies for the future will strengthen AALL's core purpose and values and will give AALL the direction and flexibility needed to grow as an organization, while placing primary focus on members.

Core purpose of AALL

The American Association of Law Libraries strengthens the profession of law librarianship and supports the individual efforts of our members.

Core values of AALL

AALL values:

- Lifelong learning and intellectual growth.
- The role of the law librarian in a democratic society.
- Equitable and permanent access to legal information.
- Continuous improvement in the quality of justice.
- Community.

GOALS AND OBJECTIVES

Goal I: Leadership

Law librarians will be recognized and valued as the foremost leaders and experts in legal information, research, and technology.

Objectives:

- Provide tools to increase members' abilities to position themselves as essential to the mission of their organizations.
- Provide leadership training opportunities.
- Expand mentoring programs and opportunities.
- Increase AALL participation in organizations within the legal and library communities.

Goal II: Education

Law librarians will have the education and training they need to meet and leverage the challenges of the changing information environment.

Objectives:

- Expand the scope of educational offerings to meet the ever-changing needs of members.
- Develop partnerships to increase the range of educational offerings.
- Use a wide range of delivery means and opportunities to provide education beyond the Annual Meeting.
- Increase the number of library school programs for law librarianship and increase awareness of law librarianship as a profession.
- Increase the number and amount of grants and scholarships.

Goal III: Advocacy

Law librarians will influence the outcome of legal information, technology policy, and librarianship issues of concern to AALL members.

Objectives:

- Increase resources available for advocacy efforts.
- Continue to expand international role.
- Improve grassroots participation in advocacy efforts.

MEMBERSHIP AND STRUCTURE

A September 2007, tally of AALL's 5041 members showed a division into the following types of library categories: 36% (a total of 1826 members) worked in academic law libraries; 11% (578 members) in state, court, and county law libraries; 37% (1865) in private law firm

and corporate law libraries; and 15% (772) in other organizations.

The American Association of Law Libraries members worked for more than 2000 different institutions, including 1073 law firms, 233 law schools, 179 corporations, 200 state or municipal government agencies, 150 state or municipal courts, and 52 federal government agencies. Other employers included vendors, independent self-employed librarians, other public or academic libraries, and associations.

In 2007, AALL members' libraries had a total combined information budget—hard copy and electronic—of more than \$1.3 billion; the average information budget per library was \$1.1 million. Libraries were spending growing percentages of their budgets on electronic resources, varying considerably by library type: academic libraries, 18%; government, 20%; and private law firms, 62%.

SPECIAL INTEREST SECTIONS

The American Association of Law Libraries' special interest sections (SIS) help members focus on issues of personal interest or concern to their daily work. At a forum held in 2000, the leaders of the SISs defined themselves as "a self-selecting group of members with a common interest, which serves as a forum, contributes educational value, serves as a resource for expertise, advocates, and provides leadership group opportunities."

These SISs hold meetings, produce publications, and provide a vehicle for networking and the exchange of information. Individual memberships in SISs remained high through the years. For example, in December 2007, AALL's members held 7172 memberships in its SISs:

Academic Law Libraries: 1220
 Computing Services: 501
 Legal History and Rare Books: 243
 Legal Information Services to the Public: 313
 Foreign, Comparative, and International Law: 423
 Government Documents: 323
 Micrographics and Audiovisual: 82
 Online Bibliographic Services: 321
 Private Law Libraries: 1512
 Research Instruction and Patron Services: 800
 Social Responsibilities: 205
 State, Court, and County Law Libraries: 541
 Technical Services: 688

AALL Entries

In addition to the SISs, members early on recognized the value in allying along geographic lines. Some 31 entries now provide members a forum for their AALL and region-specific interests.

AALLNET

Since the late 1990s, AALL's Web site, AALLNET, has served to foster the mission and Strategic Directions of the Association. The American Association of Law Libraries NET promotes law librarians, law librarianship, and the Association itself to as wide an audience as possible.

It is a valuable tool, providing members with archived information about the Association's past, up-to-date information about AALL and law librarianship, and information to help law librarians who wish to continue their professional education.

Through the years, AALLNET has continually evolved in order to provide its members with valuable tools, including:

- In 2004, the AALL general election was held electronically for the first time. This gave members the ability to electronically submit a ballot anytime of the day at anytime of the week during the election.

- In 2005, the same online election system was modified so that AALL entries and SIS may conduct their elections electronically.
- In 2006, AALLNET launched a calendar of events. Sustained by the contributions of AALL members, information about events pertaining to law librarianship can be found online.
- In 2007, audio and video recordings of professional development programs, which were the result of continuing professional education (CPE) grants, were made available in the Members Only Section.

FOSTERING MEMBER GROWTH

The American Association of Law Libraries is committed to building the profession of law librarianship in numerous ways, including providing financial aid for library school and law school education, and helping new professionals become successful through student memberships and mentoring programs.

CPE

The American Association of Law Libraries provides increasing support to the professional development of its members. In the fall of 2005, the Association held an Education Summit to connect AALL members who expected their Association to provide more opportunities for continuing education between AALL's Annual Meetings. This need expressed by members aligns with AALL's three Strategic Directions—leadership, education, and advocacy—the core service goals of AALL from 2005 to 2010. A number of initiatives grew out of the Education Summit.

In January 2006, AALLNET launched a calendar of events, which includes listings of professional education events throughout the country and abroad that are of interest to law librarians. Built largely by contributions of AALL members, the calendar lists upcoming and archived events that are sponsored by a wide variety of entities.

By May 2006, AALLNET included a Speakers Directory, which provides names of speakers suggested by AALL members. Searchable by either name or area of speaker expertise, this database showcases the expertise of AALL members and makes known the names of speakers who have presented to law librarian groups.

Eager to participate in providing continuing education tailored to meet the needs of law librarians, Michael Chiorazzi, director and professor of law at the University of Arizona College of Law Library, and Mark Estes, director of library services at Holme Roberts Owen LLP, quickly developed programs for AALL members. Chiorazzi and Estes received approval and funding for their proposals from the AALL Executive Board at its Spring 2006 meeting.

Longtime supporter of AALL professional education activities, BNA Inc., which had generously sponsored the Education Summit, agreed to largely fund Estes' program on law firm library management.

Then Vice President Sally Holterhoff formed the AALL CPE Committee. The stage was set to revitalize AALL's role in providing more high-quality professional education opportunities for law librarians.

The new approach to determining content for continuing education programs is to be member driven, and the CPE Committee's role is to work with staff to make these events happen as quickly and seamlessly as possible for everyone.

In 2007, the Association added new content and resources to AALLNET, the Association's Web site, including streaming media. Now posted as free, members-only educational resources are more than 40 video and audio programs, including *How to Use Competitive Intelligence to Win Clients*, *The Creative Conflict Resolution Toolbox*, and *The Future of Cataloging*.

Bringing select Annual Meeting content to members was also part of new effort to repackage and extend learning opportunities to members who could not attend the Annual Meeting.

These resources allow geographically-dispersed members to have access to online content. These resources also allow members to see and/or hear specific speakers and use them for a future program. The content serves as a springboard for education sessions. One example includes members who utilized one of the videos for staff training and discussion.

The American Association of Law Libraries continues to provide quality educational programs at the AALL Annual Meeting and Conference. Nearly 1700 registrants attended the 100th AALL Annual Meeting and Conference in New Orleans, July 14–17, 2007. The theme, "Rise to the Challenge," reflected both the challenges facing the host city in the aftermath of Hurricane Katrina and those currently faced by law librarians. Thanks to the hard work and flexibility of AALL staff and members, the Annual Meeting schedule provided a balance of educational programming, membership entity meetings, and networking time within a four-day time frame (one day shorter than previous Annual Meetings), beginning with the Opening Event on Saturday evening and concluding with the Closing Banquet on Tuesday night.

Presented in New Orleans were 66 conference programs and four workshops, which had been selected by the 2007 Annual Meeting Program Committee. These, plus 23 special interest section-sponsored programs, covered a wide range of topics.

Scholarships and Grants

Each year, AALL offers a number of different scholarships and grants to both students and practicing law

librarians to either complete their education or further continue it.

The American Association of Law Libraries has four different scholarship funds from which approximately 20 scholarships are given each year. These scholarships are funded by a combination of an AALL endowment and contributions from both individual members and legal publishers. These scholarships are given to students that have chosen law librarianship as their career to help with their education expenses.

The American Association of Law Libraries also awards more than 20 grants each year to attend that Annual Meeting and/or educational workshops. These grants are supported by both individual member contributions and donations from legal publishers. The AALL grant program was started in 1952. Since the inception, more than 1000 law librarians have been given funding assistance to attend the Annual Meeting and educational programs.

A CPE Grant Program has also been established by AALL. The Strategic Direction of education is to endure that the law librarians receive the education and training needed to meet and leverage the challenges of the changing information environment. The purpose of the grant program is to encourage program development and promote sharing among AALL entities. The grants program provides funding to AALL Headquarters, entries, SIS, member institutions, caucuses, and individual AALL members to assist in providing ongoing quality continuing education programming outside of the AALL Annual Meeting, which can be distributed to a wider audience.

New Members: Conference of Newer Librarians

Mentoring new members has been an Association priority. A program developed by the Mentoring Committee helps newer members—or those needing career guidance—establish personal contact with experienced law librarians, who act as resources and advisers on the profession and the Association. The Conference of Newer Librarians is now a standing committee and will conduct an annual program to take place at each AALL Annual Meeting.

Ethics and Diversity

The American Association of Law Libraries members recognize their professional roles in the broader legal and social environments.

In 1999, AALL's members endorsed updated "Ethical Principles" produced by the AALL Special Committee on Ethics, to replace the Association's prior "Code of Ethics." The principles offer standards for law librarians to follow when serving diverse clientele, building business relationships, and fulfilling their professional responsibilities.

A symposium on diversity is held annually, supporting AALL's commitment toward diversity in the profession. The sessions at each Annual Meeting examine law librarian's roles in providing legal information to all citizens, including cultural minority groups. The symposia help participants appreciate how ethnic, cultural, and lifestyle differences affect law librarianship, and provide guidance on how to address these issues in daily work.

AALL LEADERSHIP IN SHAPING THE LEGAL INFORMATION ENVIRONMENT

The American Association of Law Libraries continues to advance its unique role as a twenty-first century leader in the legal information arena. It provides the enhanced credibility that a national presence on many fronts can bring to both the Association and to its membership. Due to the impact of the rapid pace of technological change on libraries, as well as the opportunities and challenges of the digital age, AALL's policy work is among the top priorities of the Association.

AALL's Washington Affairs Office

The American Association of Law Libraries' Washington Affairs Office has become a driving force in policy debates affecting members and is a leader on information policy issues. Its staff adheres to the AALL Government Relations Policy approved in March 2001. Washington Affairs Representative Robert Oakley (director of the law library and professor of law, Georgetown University Law Center) was a national and international expert on copyright law until his untimely death in November 2007. The American Association of Law Libraries' Washington Affairs Office staff led the Association's efforts to ensure that law librarians' views are voiced and considered in the formation of state, national, and international policy, focusing on copyright and fair use, legal publishing, the digital information environment, and public access to government information.

The Washington Office actively represents member interests to executive, judicial, and legislative policy makers through formal comments and testimony. The staff also participates in important coalitions of information professionals, including the Library Copyright Alliance (the library community's united voice on copyright issues such as fair use and preservation) and OpenTheGovernment.org (a broad-based coalition that seeks to advance the public's right to know and to reduce secrecy in government). In addition, the Washington affairs representative serves as AALL's liaison to a number of government agencies and organizations.

The American Association of Law Libraries' Washington presence means that the Association can act quickly to advocate member interests as issues emerge, whether they

relate to legal publishing, legislative, or policy concerns. The office also alerts members to important federal and state issues, and encourages grassroots advocacy campaigns that involve members of AALL and its entries in promoting the Association's policies and the profession of law librarianship.

As a national leader in information policy, in 2003 AALL published the groundbreaking *State-by-State Report on Permanent Public Access to Electronic Government Information* that researched and reported what, if anything, state governments were doing to meet the enormous challenges of ensuring permanency and public accessibility of government information on the Web. This report raised national awareness and encouraged states to take steps to ensure permanent public access to electronic state government information. As a result, to date nine states have enacted legislation requiring permanent public access to their electronic government information.

In order to focus on an equally important requirement of the life cycle of electronic government information, in 2007 AALL published a second groundbreaking report, the *State-by-State Report on Authentication of Online Legal Resources*. It examined the results of a state survey that investigated whether government-hosted legal resources on the Web are *official* and capable of being considered *authentic*. In researching the question of how trustworthy state-level primary legal resources on the Web are, the report concluded that a significant number of state online resources are *official* but none are authenticated or afford ready authentication by standard methods. State online primary legal resource are, therefore, not sufficiently trustworthy.

The report also found that many states are discontinuing the print versions of legal sources, especially administrative materials, and substituting online versions that are neither official nor authenticated. The American Association of Law Libraries' *Authentication Report* raised concerns that must be addressed by all levels of government, both as high-level policy decisions and as technical issues.

The American Association of Law Libraries convened a National Summit on Authentication of Digital Legal Information in Chicago in April 2007. Approximately 50 delegates from the judiciary, legal community, state governments, and interested organizations, all of whom share AALL's concern about ensuring the authenticity of digital legal information, participated in discussions about the *Authentication Report* findings. The American Association of Law Libraries continues to work with these new allies to explore legal and technological solutions to ensure that state online legal resources are authenticated and trustworthy.

The following illustrate the broad range of policy issues addressed by AALL. The Association:

Advocated for adequate funding for the U.S. Government Printing Office (GPO) and the National

Archives and Records Administration to enable these agencies to meet the challenges of the digital age in providing access to and preserving electronic federal government information;

Promoted public access to government information through the Federal Depository Library Program and GPOs Federal Digital System that will bring the program into the twenty-first century, particularly in regards to digital authentication;

Collaborated with other library associations to advocate for balance in federal copyright law as a member of the Library Copyright Alliance;

Participated in filing several amicus briefs in *Greenberg v. National Geographic Society*, a case that alleged copyright infringement by National Geographic Society due to the publication of 100 years of past issues of its magazine on CD; AALL believed that digitizing past issues of the magazine is a permitted revision of the collective works;

Participated in a coalition to promote openness in government and fight secrecy, including through legislation such as the OPEN Government Act of 2007 (P.L. 110–175);

Worked with our entries to engage them in our advocacy work and built a successful member grassroots advocacy program that is critical to our legislative and policy successes.

UNIVERSAL CITATION GUIDE

In 1995, the Task Force on Citation Formats issued its report addressing the controversial issue of vendor- and medium-neutral citations to legal authorities. At a special meeting in July, the executive board adopted the report's recommendations regarding public domain case citation form.

The American Association of Law Libraries became the first national organization to recommend a new standard for citing primary law, case, constitution, statutory, and administrative law in response to member expectations for vendor-neutral citations and the increasing use of electronic information sources. The new format—using standardized abbreviations and other detailed specifications—was published in AALL's *Universal Citation Guide* in 1999. This publication, culminating three years' work by AALL's Committee on Citation Formats, was published by the State Bar of Wisconsin. The work allows users to cite court opinions as issued, regardless of the format in which they appear. The American Bar Association Special Committee on Citation Issues endorsed AALL's citation format and recommended that it become a national standard. In the late 1990s, several states adopted public domain citation for their bodies of case law and recognized AALL's leadership. As of January 2008, 15 states had adopted a medium and vendor-neutral citation system.

A second edition of the guide, published and distributed by William S. Hein & Co., Inc., was released in 2004. The new edition updates the material presented in the original guide.

PUBLISHER RELATIONS

The American Association of Law Libraries' advocacy work with legal publishers is headed up by the Committee on Relations with Information Vendors (CRIV). This committee facilitates communication among information vendors, legal publishers, and Association members. It monitors legal publishing developments, presents the annual new product award, and investigates complaints from members.

The CRIV Sheet, the committee's newsletter that comes out three times per year, tracks industry developments and presents substantive articles about complaint resolutions and legal publishing issues. On its Web site, the CRIV lists CRIV Tools, such as checklists, sample forms, or sample letters, to aid acquisitions and serials librarians in the performance of routine tasks or to assist them in solving commonly occurring problems.

The committee also conducts periodic site visits to legal publishers to learn more about their plans and operations and to represent the interests and concerns of members. In recent years, the CRIV has visited Commerce Clearing House, Inc. (CCH), Lexis Publishing, William S. Hein and Company, Aspen Publishing, West Group, and the Bureau of National Affairs, Inc. Each year at the Association's Annual Meeting, the CRIV sponsors a forum for legal publishing leaders and members.

The CRIV gained considerable importance in the Association during the 1990s, as information vendors increasingly merged to form megapublishers. In 1999–2000, AALL created a Special Committee on Fair Business Practices to prepare guidelines to replace the recently expired Federal Trade Commission's *Guides for the Law Book Industry*. In 2002, the AALL Executive Board approved the *AALL Guide to Fair Business Practices for Legal Publishers* and created a Fair Business Practices Implementation Task Force. The task force steered the distribution and promotion of the new guide as the accepted standard in the industry and monitored its ongoing interpretation, revision, and evaluation. A second edition of the guide was published and distributed to AALL members in 2007.

The *AALL Guide to Fair Business Practices for Legal Publishers* describes standards for the business practices of publishers that most directly affect law librarians and covers the full range of their interactions, from advertising and solicitation to purchases and customer support. It consists of five general principles, each of which is accompanied by subprinciples and examples. It does not explicitly require any methods of operation because it is not intended to interfere with particular business models. As

indicated in the introduction, the guide “is designed to allow legal publishers to take advantage of evolving technology and to foster innovation while adhering to principled business practices that will ensure fair and appropriate treatment for customers.”

In 2002, recognizing the growing role of license agreements in law library acquisitions, AALL created a Special Committee on Licensing Principles for Electronic Resources. The committee was charged to review the Principles for Licensing Electronic Resources endorsed by the AALL Executive Board in July 1997 and revise and update them as needed.

In 2004, the AALL Executive Board approved the new Principles for Licensing Electronic Resources. The revised principles provide expanded guidance in the areas of access, interlibrary loan, archiving, usage statistics, and dispute resolution. The organization of the document facilitates its use as a checklist for reviewing license agreements, so it is a valuable tool for librarians and vendors alike. The principles are not intended to dictate specific licensing terms, but rather are intended to serve as guidelines and best practices for parties involved in the licensing process.

ENCOURAGING VALUED PARTNERSHIPS

The American Association of Law Libraries’ many accomplishments are the result of collaborative efforts with other sister associations and of activities generously supported by legal publishers. These partners work with AALL to advance the interest of law libraries in many important areas.

In July 2008, AALL will again cosponsor a Joint Study Institute, “Harmonization and Confrontation: Integrating Foreign and International Law into the American Legal System” to be held at Georgetown University Law School. The American Association of Law Libraries joins four other law library associations, the Australian Law Librarians’ Association, British and Irish Association of Law Librarians, Canadian Association of Law Libraries, and the New Zealand Law Librarians’ Association, in sponsoring the event.

The American Association of Law Libraries also provides funds for designated leaders or the executive director to represent the Association at other national organizations that share common objectives. This presence leads to greater law librarian involvement in the library and legal communities, such as consulting on library standards and sponsoring joint educational programs. The AALL supports involvement with such organizations as

American Bar Association
American Library Association

Association for Library and Information Science Education
Association of American Law Schools
Association of Legal Administrators
British and Irish Association of Law Librarians
Canadian Association of Law Libraries
Center for Computer-Assisted Legal Instruction
Federal Depository Library Council
Friends of the Law Library of Congress
Institute of Museum and Library Services
International Association of Law Libraries
International Federation of Library Associations
Legal Information Preservation Alliance
Legal Marketing Association
Mayflower II Conference
National Center for State Courts
National Commission on Libraries and Information Science
National Equal Justice Library
National Information Standards Organization
Self Represented Litigation Network
Special Libraries Association
Special Libraries Association Legal Division

PUBLICATIONS

AALL Spectrum

In September 1996, the AALL launched its new magazine, *AALL Spectrum*, which is now issued nine times each year, monthly except for January and August with a combined September/October. The full-color magazine replaced the former newsletter and positioned the Association toward new editorial directions. It focuses on broad issues of interest to members and others in the larger legal and library communities. It also covers Association news and legislative reports from the Washington Affairs Office.

AALL Spectrum includes three regular inserts. *The CRIV Sheet* is written and coordinated by the AALL CRIV three times per year to provide general information on vendor/library relations and to foster a constructive dialogue between the legal publishing/legal information industry and the law library community. *Members’ Briefing* also appears three times per year and is written by member subject experts who summarize important issues and present practical ideas for handling them in the workplace. Lastly, each June issue includes a city survival guide with important travel information for AALL members attending the Annual Meeting. Other regular features of *AALL Spectrum* include practice-oriented columns on “Practicing Law Librarianship,” “Public Relations,” and “Teaching Legal Research,” as well as popular interactive departments like “Member to Member” and “Views from You.”

Law Library Journal

Law Library Journal (LLJ) has been the official publication of the association since it was first published in 1908 in a combined format with the *Index to Legal Periodicals*. Although the *Index to Legal Periodicals* has long since become a separate publication, the *LLJ* has been continuously published on a quarterly basis ever since. As the premier publication in the law library profession, it features scholarly articles on law, legal materials, and librarianship, as well as practice-oriented articles, book reviews, AALL Executive Board election information, and proceedings of the business sessions of the AALL Annual Meeting. In addition to its traditional print format, *LLJ* is currently available in a variety of electronic sources, including four online databases. In recent years, the *LLJ* has had three editors: Richard A. Danner, volumes 77–86, 1984–1994; Frank G. Houdek, volumes 87–99, 1995–2007; and Janet Sinder, volumes 100–present, 2008–present. The editor is assisted by the *Law Library Journal/AALL Spectrum* Editorial Board and Advisory Committee.

AALL Directory and Handbook

Published annually, the *AALL Directory and Handbook* is distributed to all dues-paying members of the Association. It provides an alphabetical listing of all members, as well as listings of all libraries where members are employed. The handbook section contains Association policies and guidelines, committee charges and rosters, and other pertinent Association information. The directory was first published as *List of Law Libraries in the United States and Canada* in 1940 for the Association through the courtesy of CCH. It has been continuously published by CCH, now Wolters Kluwer Law & Business, ever since.

AALL Biennial Salary Survey

The American Association of Law Libraries is a definitive source for information and statistics about the salaries paid to law librarians and about trends in law library expenditures and services. Every 2 years, since 1995, AALL has gathered meaningful information about members' libraries through the *AALL Biennial Salary Survey and Organizational Characteristics*, which provides such statistics as ratios of attorneys to librarians and expenditures for hard copy versus electronic information. The survey's results help librarians manage their own libraries and leverage AALL's influence with publishers and opinion leaders in the legal community.

Index to Foreign Legal Periodicals

The *Index to Foreign Legal Periodicals* is a multilingual index to articles and book reviews appearing in approximately 540 journals and annuals published worldwide. It

provides a subject, author, and geographic approach to comparative and foreign law and the law of all jurisdictions throughout the world, except the United States, United Kingdom, Canada, and Australia. It also provides in-depth coverage of public and private international law.

In addition to periodical publications, the *Index to Foreign Legal Periodicals* analyses about 80 individually published collections of legal essays, Festschriften, Melanges, and congress reports each year. Beginning in 1960, the *Index to Foreign Legal Periodicals* was first published by the Institute of Advanced Legal Studies of the University of London. In 1984, the *Index to Foreign Legal Periodicals* moved to its present location in the Garret W. McEnerney Law Library at Boalt Hall School of Law at the University of California, Berkeley, where it utilizes the library's international and foreign law collection, the largest and most comprehensive in the western United States.

The *Index to Foreign Legal Periodicals* is published quarterly with an annual bound cumulation by the University of California Press. Each single issue consists of approximately 2600 articles and 300 book reviews. In addition to the hard bound volume, the index is also available electronically via Ovid Technologies. Ovid offers complete online coverage of the index from 1985 to the present.

Subscription information and a complete list of all serials currently indexed, as well as links to the index's electronic publishing partners, are available at the Index Web site (<http://www.law.berkeley.edu/library/iflp>).

AALL Price Index for Legal Publications

The *AALL Price Index for Legal Publications* is an annual table-based index that documents the mean cost of titles and percentage increases over previous years for monographs, serial publications, legal periodicals, looseleaf services, commercially-published court reporters, and legal continuations. The *Price Index* concludes with an appendix of all products and legal vendors that were surveyed. Pricing information is compiled each year by the AALL Price Index for Legal Publications Committee, which is comprised of seven AALL members.

AALL Publications Series

This series of monographs, sponsored by the Association, began in 1960 with the assistance of the Fred B. Rothman Company as publisher. It continues today in partnership with W.S. Hein and Company Inc. as publisher. It now includes more than 60 individual titles and contains a wealth of information for law librarians, including *Practicing Reference: Thoughts for Librarians and Legal Researchers*, *United States Tribal Courts Directory*, and *Werner's Manual for Prison Law Libraries*. Potential manuscripts for the series are reviewed and evaluated by the AALL Publications Committee, which manages the series.

American Association of Museums (AAM)

Elizabeth E. Merritt

American Association of Museums, Washington, District of Columbia, U.S.A.

Abstract

Founded in 1906, American Association of Museums (AAM) is an organization whose mission is “to enhance the value of museums to their communities through leadership, advocacy and service.” It is the only organization representing the entire scope of museums and the professionals and nonpaid staff who work for and with museums. As of 2008, it represents more than 15,000 individual museum professionals and volunteers, 3000 institutions, and 300 corporate members.

HISTORY

The American Association of Museums (AAM) was organized in 1906 to develop standards and best practices for museums, gather and share knowledge, and provide advocacy on issues of concern to the entire museum community. AAM is the only organization representing the entire scope of museums and the professionals and nonpaid staff who work for and with museums. As of 2008, it represents more than 15,000 individual museum professionals and volunteers, 3000 institutions and 300 corporate members. Individual members span the range of museum occupations, including directors, curators, registrars, educators, exhibit designers, public relations officers, development officers, security managers, trustees, and volunteers. Every type of museum is represented, including art, history, science, military, maritime, and youth museums, as well as aquariums, zoos, botanical gardens, arboretums, historic sites, and science and technology centers.

The association was established at a meeting of representatives of 21 U.S. museums held at the American Museum of Natural History on May 15, 1906. It filed for incorporation in 1920, and in 1923 established a headquarters in Washington, D.C., at the Smithsonian Castle. Notable accomplishments include

- 1925: Publication of *Code of Ethics for Museum Workers*.
- 1930: Publication of the comprehensive *Museums in America*.
- 1968: AAM accreditation committee chartered.
- 1969: *America's Museums: The Belmont Report* assessed the future and the needs of American museums, developing a solid case for federal support.
- 1970: AAM designates the first accredited museums.
- 1973: *Museum Studies: A Curriculum Guide for Universities and Museums* offers guidelines and minimum standards for museum studies programs.

- 1980: Museum Assessment Program (MAP) begins.
- 1994: *Museum Counts*, the first comprehensive survey of U.S. museum finances and practice.
- 1992: *Excellence and Equity*, a landmark report outlining museums' educational and public service roles.
- 1995: *Museums in the Life of a City: Strategies for Community Partnerships*, which laid the groundwork for a more expansive role for museums in community service.
- 2002: *Mastering Civic Engagement: A Challenge to Museums*, a call to action to museums to realize fully their potential as active, visible players in the lives of their communities.
- 2006: To mark AAM's centennial, the publication of *Riches, Rival and Radicals: 100 Years of Museums in America*, a history of the evolution of museums in the United States.
- 2008: *National Standards and Best Practices for U.S. Museums*, the current, field-wide operating standards in all areas of museum operations, published for the first time.
- 2009: The founding of AAM's Center for the Future of Museums, the field's think tank and forum for discussions on how best to prepare for and shape the future of the nation's museums.

STRUCTURE AND GOVERNANCE

AAM is a 501(c) 3 tax-exempt organization whose mission is “to enhance the value of museums to their communities through leadership, advocacy and service.” It is governed by a board of directors consisting of 3 officers of the association (chair, vice-chair, and immediate past chair) and 18 board members-at-large elected by the membership. Its bylaws establish various committees, notably the International Council of Museums-United

States (ICOM-US), which helps the association represent museums within the United States to ICOM as well as ICOM's interests within the United States. The International Council of Museums (ICOM) is dedicated to improving and advancing the world's museums and the museum profession as well as preserving cultural heritage while respecting the culture from which it comes. To join ICOM, museum professionals within the United States join their national committee, ICOM-US.

AAM actively seeks the opinions and counsel of its members and is advised by a variety of committees and associations throughout the museum field. Per the association's bylaws, these advisers include three groups. The Standing Professional Committees, open to AAM members and representing specific disciplines such as curators, development, membership, education, media and technology, PR, and marketing and small museum administrators. The Council of Regional Associations informs AAM of policy deliberations that may have an impact in the museum field; it comprises the New England Museum Association, Mid-Atlantic Association of Museums, Southeastern Museums Conference, Association of Midwest Museums, Mountain-Plains Museums Association, and Western Museums Association. The Council of Affiliates, made up of associations of professional categories such as state and local history, conservation, museum stores, volunteers, computers, and trustees, in addition to discipline-specific museum associations representing, for example, zoo, aquariums, colleges, children, science, and Jewish and African American history and culture.

In addition, AAM has created Professional Interest Committees, which enable people and institutions with common interests or needs to develop professional associations. They are open to AAM members. Committee interests range from those of Asian Pacific Americans, Latinos, Native Americans, and gays and lesbians to professionals in the areas of historic house museums, traveling exhibitions, and visitor services.

ACTIVITIES AND PRIORITIES

The association also presents forums for museum professionals to share information and experience. Principal among these is the annual meeting and MuseumExpo™, open to participants from around the world. It is the world's largest conference of museum professionals, offering educational opportunities through its sessions and events at local museums as well as job-hunting forums and the MuseumExpo's extensive showcase of museum products and services.

A key AAM priority is advocating for the value of museums, especially before Congress and within the federal government. The association addresses legislative and regulatory issues that affect museums, particularly increased

funding, and strives to keep advocates informed about issues in Washington through regular communications to AAM's Museum Advocacy Team network and its member newsletter, *Aviso*.

AAM's projects and initiatives serve as a venue and catalyst for new ideas to address issues facing the field, resulting in a variety of products and services. Examples include International Museum Day, Museums and Diversity, the Nazi-Era Provenance Internet Portal, and Small Museums initiatives, and collaborations such as the Non-Profit Listening Post Project; Museums, Archives and Libraries and Partners in Tourism. AAM also seeks to serve new audiences by identifying groups such as Emerging Museum Professionals—those in the profession for less than 10 years. The association offers "EMPs" person-to-person and online networking and mentoring, fellowships, blogs, events, and other resources to guide their career path.

AAM provides a number of services to the field at large. Many are available to museums that are not members. These include the following:

The Accreditation Program serves as the field's primary vehicle for quality assurance and self-regulation, formally recognizing museums' commitment to excellence, accountability, high professional standards, and continued institutional improvement. It accomplishes this by employing a standardized process of self-study and peer review to assess how well each museum achieves its stated mission and goals and meets the standards and best practices generally accepted in the museum field. Any museum can apply for accreditation. Reaccreditation is required after 10 years.

The Museum Assessment Program (MAP), established and administered in collaboration with the Institute of Museum and Library Services, helps maintain and improve operations through a confidential, consultative process, providing guidance in meeting priorities and goals and understanding how a museum compares to standards and best practices. The four categories of assessment are institutional, collections management, public dimension, and governance.

AAM's online bookstore provides publications on a full range of topics relevant to the field. A notable recent example is *AAM Standards and Best Practices for U.S. Museums*, which spells out voluntary national standards and best practices—benchmarks against which museums measure their own performance. A key goal is to help policy makers, media, philanthropic organizations, donors, and members of the public to assess museums' achievements.

The Professional Education Program offers tools for finding solutions to some of the most critical issues in the field. Seminars and workshops are held throughout the year across the United States, in addition to webinars and Web conference programs, addressing the needs of museum professionals at all levels of their careers—emerging, mid-level, executive, and beyond. Topics address exhibitions,

and legal issues, visitor experience, executive leadership, technology, interpretation, and historical administration.

SERVICES TO MEMBERS

Beyond its service to the entire field, AAM offers its members the following benefits: It helps them save money, become more influential in their communities and profession, and better serve their public. Its resources include free subscriptions to publications; discounts on books and annual meeting registration, access to peer groups, full access to jobHQ and the Information Center, professional education seminars, books, free and discounted admission to participating member museums and affinity partners; and more. Advantages include the following.

JobHQ allows members to tailor their job searches, receive e-mail alerts when new jobs are posted and post resumes. Employers can list jobs 24 hr a day, track and measure online recruitment activity, and search a database of highly qualified candidates.

AAM's publications department produces members-only benefits such as *Museum*, an award-winning, bimonthly magazine; *Aviso*, a monthly e-newsletter that reports on museums in the news, federal legislation affecting museums, upcoming seminars and workshops, federal grant deadlines and AAM activities and services; bookstore discounts; and Web Exclusives: special online articles and extras, including Practically Speaking (hands-on information); "Day in the Life," first-hand accounts on how active professionals do their jobs; and audio clips of interviews and excerpts.

The Information Center offers fast, easy access to extensive online resources to AAM members and staff of AAM member museums: fact sheets, glossaries, and hundreds of links that have been individually reviewed and described for their usefulness to museums. Staff of AAM

member museums also receive confidential, customized reference services within two business days, as well as access to more than 900 sample documents in more than 50 categories, from a variety of types and sizes of museums.

The association's awards and competitions celebrate excellence in the museum field. Two popular competitions open to museum staff around the world are the Publications Competition (Pub Comp), honoring 16 categories from books, catalogs and posters to marketing materials and annual reports, and the Brooking Paper on Creativity in Museums. Other awards include the Nancy Hanks Memorial Award for Professional Excellence, the Award for Distinguished Service to Museums, and more. The Museums and Community Collaborations Abroad (MCCA) is a new grant program designed to strengthen international connections through innovative, museum-based exchanges; funding is provided through a partnership with the U.S. Department of State Bureau of Educational and Cultural Affairs. AAM also provides fellowships for attendance at its annual meeting and professional education seminars and webinars.

CONCLUSION

As AAM embarks on its second century, it is guided by new leadership, structure, and vision—for itself and the field at large. Its new Strategic Framework contains ideas and goals that will drive the association's behavior and activities into the future and guide decisions. The upcoming Center for the Future of Museums will bring in thought leaders from a variety of professions to identify and shape new directions. AAM welcomes input from all who care about museums and their critical role in American society. For additional information or to contact the association, please visit the AAM Web site at <http://www.aam-us.org>.

American Association of School Librarians (AASL)

Donald C. Adcock

Dominican University, River Forest, Illinois, U.S.A.

Abstract

The American Association of School Librarians (AASL), a type-of-library division of the American Library Association (ALA), serves the needs of over 10,000 school library media specialists. Its mission is to advocate excellence, facilitate change, and develop leaders in the school library media field. This entry discusses the history of AASL, describes its organization and governance, and highlights its major accomplishment.

INTRODUCTION

The American Association of School Librarians (AASL), a type-of-library division of the American Library Association (ALA), is interested in the general improvement and extension of school library services for children and young people.

The American Association of School Librarians has specific responsibility for: planning of programs of study and services for the improvement and extension of library services in elementary and secondary schools as a means of strengthening the educational program; evaluation, selection, interpretation and utilization of media as it is used in the context of the school library program; stimulation of continuous study and research in the school library media field and to establish criteria of evaluation; synthesis of the activities of all units of the American Library Association in the areas of mutual concern; representation and interpretation of the need for the function of school libraries to other educational and lay groups; stimulation of professional growth, improvement of the status of school librarians, and encouragement of participation by members in appropriate type-of-activity divisions; conduct activities and projects for improvement and extension of service in the school library media center when such projects are beyond the scope of type-of-activity divisions, after specific approval by the ALA Council.^[1]

DESCRIPTION

Vision

The American Association of School Librarians is

- A proactive organization that addresses issues, anticipates trends, and sets the agenda for the profession.

- An advocate for the indispensable role of school library media programs with school library media specialists, for best practices in school librarianship, and for the core values and ethics of the library profession.
- An open, friendly, welcoming organization that embraces cultural and ethnic diversity.
- An inclusive professional home for all school library media specialists and a partner in mutual interests with educators, technologists, researchers, vendors, and other librarians.
- An essential resource for school library media specialists seeking professional development, leadership opportunities, communication with peers, and the most current information, research, and theory in the field.
- A flexible, responsive organization that models effective management practices.^[2]

Mission

The mission of the American Association of School Librarians is to advocate excellence, facilitate change, and develop leaders in the school library media field.

Goals

AASL works to ensure that all members of the school library media field collaborate to

- Provide leadership in the total education program.
- Participate as active partners in the teaching/learning process.
- Connect learners with ideas and information.
- Prepare students for lifelong learning, informed decision-making, a love of reading, and the use of information technologies.^[3]

Values

AASL will

- Make a difference for members of the field/profession by addressing the important issues.
- Have a national presence and a national identity.
- Encourage diversity in its membership.
- Be organized to clearly address the identified essential functions.
- Have a structure to allow members to be represented in the decision-making process.
- Provide involvement opportunities that will be varied and geographically dispersed.
- Be fast, focused, friendly, flexible, and fun.^[4]

EARLY BEGINNINGS

Although the formation of the AASL can be traced back to the ALA Midwinter Meeting in 1914, it did not achieve division status until 1951. In 1914, the Normal and High School Librarians Roundtable petitioned the ALA Council to form a school libraries section. The petition was granted and the section held its first meeting in June of 1915 and elected Mary E. Hall as its president. Two other groups outside the ALA were also interested in promoting school libraries. The National Council of Teachers of English had a Library Section from 1913 until 1919. In July 1896, the National Education Association (NEA) established a Library Department, and, in September of that same year, the ALA Executive Board appointed the Committee on Cooperation with the NEA to foster cooperative efforts with the NEA. However, the school library group affiliated with the ALA became the sole national professional association for school librarians when the Committee on Cooperation with NEA evolved into the School Libraries Committee, which existed from 1931 until 1935. The School Libraries Committee merged with the School Librarians Section in December 1935. The School Libraries Section became one of two sections within the Division of Libraries for Children and Young People in 1941 and changed its name to the American Association of School Librarians in 1944. In 1947, the number of sections within the Division of Libraries for Children and Young People was increased to three and now consisted of the Children's Library Association, Young People's Reading Round Table, and the AASL. In 1951, the AASL became a separate division of ALA.^[5] Margaret K. Walraven was elected the first president of the AASL as a division of the American Library Association and Mildred Batchelder became the first executive secretary of the association.^[6]

ORGANIZATION AND GOVERNANCE

Board of Directors

The policy-making body of the AASL is its board of directors, which meets at the ALA Midwinter Meeting and Annual Conference. The officers of the association are president, vice-president/president elect, treasurer, and immediate past president. Members of the board are the division officers, a representative of each section, and the AASL representative to the ALA Council, regional directors chosen from nine geographical regions, two members at large, and the executive director. Board members elected from the geographical regions are elected for a 4-year term. They serve 2 years as members of the Executive Committee of the Affiliate Assembly and are designated observers of the AASL Board of Directors. During the second 2 years of their term, they are voting members of the AASL board. The association's executive committee consists of the officers, the division representative to the ALA Council, one member elected by the board of directors, and the executive director.

Executive Committee

The executive committee of the AASL consists of the president, president-elect, and treasurer, immediate past president, the AASL division councilor and one member elected on an annual basis by the board of directors. The executive director serves as an *ex-officio* nonvoting member. The executive committee acts as the budget committee of the association and is restricted to acting on policy and fiscal issues requiring action between meetings of the board.^[7]

Affiliate Assembly

The Affiliate Assembly is a more formalized version of the old State Assembly, which had its origins in the AASL Council. The council originated with the practice Ruth Ersted began during her presidency in 1947 and was continued by Frances Henne in 1948–1949. They had invited state leaders to attend AASL Executive Board meetings to establish a forum to communicate with the state leaders and get feedback from them.^[6] The assembly is composed of two representatives from state or regional school library media associations affiliated with the AASL. It was established to provide a mechanism for the affiliates to communicate the concerns of their members to the AASL Board of Directors and to report the actions of AASL to their members. To be eligible for affiliation, the president of an organization must be a member of AASL and 25 members or 10% of the association members, whichever is smaller, must also be members of AASL. The assembly

meets once a year at the ALA Annual Conference to conduct business and holds a caucus at the ALA Midwinter Meeting for the leaders of the affiliates to discuss mutual problems or attend training sessions to improve the leadership skills of the affiliate representatives. The assembly has an executive committee that meets at the ALA Midwinter Meeting and Annual Meeting and consists of its officers and the regional directors-elect.^[8]

Sections

The AASL Bylaws provide for the formation of sections, which consist of at least 25 members who represent a distinct special field of activity within the profession. Each section has a chair, a chair-elect, a secretary, and a representative to the AASL Board of Directors. Currently, there are three sections.

The Independent Schools Section provides a means for the discussion of and action on the problems relating to all phases of nonpublic school librarianship.

The Supervisors Section provides a means for discussion of and action on the problems relating to all phases of school library supervision.

The Educator of School Library Media Specialists, whose purpose is to exchange ideas, review and study curricula, and develop research activities for educators in colleges and universities whose programs focus on school library media education and training.^[8]

Committees

The programs of the association are conducted by its standing committees, special committees, and task forces. Standing committees are established to carry on the continuing work of the association. The AASL bylaws provide for three standing committees: budget, nominations, and bylaws. The president may establish additional standing or special committees or task forces at any time with the approval of the board of directors. Special committees are established for a 2-year term to deal with a specific issue. A task force is established with a specific charge to study a specific issue and recommend solutions to the board of directors. A task force exists until it has completed its charge or is dismissed by the board of directors. Currently, there are 38 standing and special committees and three task forces.^[7]

PUBLICATIONS

AASL publishes one print journal, *Knowledge Quest* (KQ), one electronic journal *School Library Media Research*, and an electronic newsletter, *AASL Hotlinks*. Each journal has an editor appointed by the president with

the consent of the board of directors and an advisory board consisting of members of the association.

Knowledge Quest, published bimonthly September through June, is devoted to offering substantive information to assist building-level library media specialists, supervisors, library educators, and other decision makers concerned with the development of school library media programs and services. Articles address the integration of theory and practice in school librarianship and new developments in education, learning theory, and relevant disciplines. *Knowledge Quest* is mailed to all members and is available to nonmembers by subscription.

Provided at no cost, *KQ on the Web* (<http://www.ala.org/aasl/kqweb/>), expands *Knowledge Quest* via the Internet. It contains "KQ Extra" items supporting one feature article and columns published in *Knowledge Quest*. These Web-only items are referenced within the relevant print article or column and direct the reader to the online content. Abstracts of feature articles and information on becoming a member of AASL or subscribing to *Knowledge Quest* are also provided.^[9]

School Library Media Research (<http://www.ala.org/aasl/SLMR/>), a refereed research journal published electronically, is the successor to *School Library Media Quarterly Online*. The purpose of *School Library Media Research* is to promote and publish high-quality original research concerning the management, implementation, and evaluation of school library media programs. The journal also emphasizes research on instructional theory, teaching methods, and critical issues relevant to school library media. *School Library Media Research* is currently available at no charge.^[10]

AASL Hotlinks is the text-only monthly e-mail newsletter of the AASL. *AASL Hotlinks* is primarily composed of brief summaries with links to more in-depth content, and includes previews of upcoming association activities and continuing education programs, news from AASL and all of ALA, valuable Web resources, highlights of new products and services, summaries of new articles from AASL's print and online journals. This text-based newsletter is sent to AASL members with valid e-mail addresses on file in the ALA member database. Additional "pass along" distribution occurs through AASL members, who are encouraged to share each issue with colleagues and administrators in their school and district, and AASL's state and regional affiliate organizations, which can redistribute the newsletter to their own members.^[11]

In addition to these two journals, AASL publishes pamphlets, brochures, small monographs, and resource guides designed to assist school library media specialists in establishing and operating school library media programs. There is a nominal charge for some of these publications, but others are available at no charge on the AASL home page (<http://www.ala.org/aasl>).

AWARDS, GRANTS, AND SCHOLARSHIPS

Generous contributions made to AASL by a number of sponsors enable AASL to fund the following awards, grants, and scholarships.

AASL Collaborative School Library Media Award

Established in 2000, the \$2500 award, sponsored by Highsmith, Inc. recognizes and hopes to encourage collaboration and partnerships between school library media specialists and teachers in meeting educational goals outlined in *Information Power: Building Partnerships for Learning*^[12] through joint planning of a program, unit, or event in support of the curriculum and using media center resources. Applicants must be AASL personal members.

ABC-CLIO Leadership Grant

Established in 1986, the grant, up to \$1750 donated by ABC-CLIO, is given to school library media associations that are AASL affiliates for planning and implementing leadership programs at the state, regional, or local levels.

Beyond Words: Dollar General School Library Relief Fund

Dollar General, in collaboration with the American Library Association (ALA), the American Association of School Librarians (AASL) and the National Education Association (NEA), sponsors the school library disaster relief fund for public school libraries in the states served by Dollar General. The fund will provide grants of \$5,000–\$15,000 to public schools whose school library program has been affected by a natural disaster (tornado, earthquake, hurricane, flood, etc.). Grants are to replace or supplement books, media, and/or library equipment in the school library setting.

Distinguished School Administrators Award

Established in 1985, the \$2000 award sponsored by ProQuest, honors a school administrator who has made worthy contributions to the operations of an exemplary school library media center and to advancing the role the school library media center in the educational program. Nominations must be made by AASL personal members.

Distinguished Service Award

Established in 1978, the \$3000 award donated by Baker and Taylor recognizes an individual member of the library profession who has, over a significant period of time, made an outstanding national contribution to school

librarianship and school library development. Nominations must be made by AASL personal members.

Frances Henne Award

Established in 1986, the \$1250 award sponsored by the Greenwood Publishing Group recognizes a school library media specialist with 5 years or less experience in the profession who demonstrates leadership qualities with students, teachers, and administrators to attend an AASL conference or ALA Annual Conference for the first time. Applicants must be AASL personal members.

Information Technology Pathfinder Award

Established in 1985 as the Microcomputer in the Media Center Award, this award of \$1000 to the school library media specialist and \$500 to the library is sponsored by the Follett Software Company. The award recognizes a school library media specialist who demonstrates vision and leadership through the use of technology. The award is given in two categories—elementary (K–6) and secondary.^[7–12] Applicants must be AASL personal members.

Innovative Reading Grant

Established in 2006, the \$2500 grant sponsored by Capstone Publishers supports the planning and implementation of a unique and innovative program for children, which motivates and encourages reading, especially struggling readers.

Intellectual Freedom Award

Established in 1982, the award, \$2000 to the recipient and \$1000 to the media center of the recipient's choice, is sponsored by ProQuest and recognizes a personal member of AASL who has upheld the principles of intellectual freedom. Applicants must be AASL personal members.

National School Library Media Program of the Year Award

Established in 1963, the award, \$10,000 (\$30,000 total) in three categories, sponsored by Follett Library Resources, recognizes school districts and single schools for exemplary school library media programs that are fully integrated into the school's curriculum. Winners receive a crystal obelisk and \$10,000 each, one district award and two single schools.

President's Crystal Apple Award

Established in 1992, the crystal apple award is given at the discretion of the AASL president to an individual or group

who has had significant impact on school libraries and students.

School Librarian's Workshop Scholarship

The scholarship, \$3000 sponsored by Jay W. Toor, president, Library Learning Resources, recognizes a full-time student preparing to become a school library media specialist at the preschool, elementary, or secondary level. The recipient must pursue graduate level education in an ALA-accredited library school program or in a school library media program that meets the ALA curriculum guidelines for the National Council for Accreditation of Teacher Education.^[13]

CONFERENCES AND EVENTS

National Conference and Exhibition

The first AASL national conference was held at the Commonwealth Convention Center in Louisville, Kentucky, in 1980. The daunting task of planning the first conference was undertaken by Rebecca Bingham, a former president of AASL and director of Library Media Services for Jefferson County (Kentucky) Public Schools, as chairperson of the conference planning committee. To bring programs and commercial exhibits closer to its members, AASL has held a national conference in a different geographical region every 2 years since that first conference. The number of attendees, the scope of the programs, and the number of exhibits have increased with each conference.

Regional Institutes

AASL licenses regional institutes to organizations who pay AASL a fee for a one-time presentation. AASL provides the organization with promotional information that it can use to develop publicity about the institute, the content for the institute and the honorarium, and all travel expenses of the presenter it provides. The organization sets its own registration fee and is responsible for all local planning, logistics, and publicity.

Fall Forum

In the fall of the years when AASL does not hold its national conference, the association provides a multiday national institute. The forum provides several speakers making presentations that deal with different aspects of a central topic. Time is provided for forum participants to interact with the presenters and each other in small discussion groups. Topics in the past have included "Assessing Student Learning in the Library Media Center" and "Collaboration and Reading to Learn @ Your Library."^[14]

GUIDELINES AND STANDARDS

School Library Programs

A preliminary report of the Commission on Library Organization and Equipment of the National Education Association and the North Central Association of Colleges and Secondary Schools chaired by C.C. Certain, principal of Cass Technical High School in Detroit, Michigan, was published in 1917.^[15] The final report, *Standard Library Organization and Equipment for Secondary Schools of Different Sizes*,^[16] became the first school library standards and was published by the ALA in 1920. Mary E. Hall, librarian at Girl's High School in Brooklyn, New York, and Hannah Logasa, librarian at the University of Chicago School of Education, both early leaders in the development of the concept of school libraries, were members of the commission. In 1925 a joint committee of the National Education Association and the American Library Association, chaired by C.C. Certain, coauthored *Elementary School Library Standards* that established standards for elementary school libraries.^[17] The next set of standards for school libraries was published in 1945 by the ALA; *School Libraries for Today and Tomorrow*^[18] was prepared by the Committees on Post-War Planning of the ALA, Division of Libraries for Children and Young People and its section, the AASL under the chairmanship of Mary Peacock Douglas. In 1960, the ALA published the third set of school library standards, *Standards for School Library Programs*.^[19] The AASL, by now a division of the ALA, prepared these standards in cooperation with the Association for Colleges for Teacher Education. *Standards for School Media Programs*,^[20] published in 1969, were the first standards jointly developed by AASL and the Department of Audiovisual Instruction [now Association for Educational Communications and Technology (AECT)]. The standards, *Media Programs: District and School*,^[21] published in 1979, were jointly developed by the AASL and the AECT and published by the ALA.

In 1988, AASL and AECT jointly prepared *Information Power: Guidelines for School Library Media Programs*. Leaders of the two associations realized that the two associations lacked authority to establish national standards but could establish national guidelines. Therefore, for the first time, the national document focusing on the development of school library programs was called guidelines rather than standards. In 1998, AASL and AECT prepared a new edition of the guidelines entitled *Information Power: Building Partnerships for Learning*,^[12] which was published by the ALA. In 2009, the American Association of School Librarians authored a new set of guidelines, *Empowering Learners: Guidelines for School Library Media Programs*, published by the ALA.

As minimal as the "Certain standards" may seem today, they were the first published national standards that provided some guidance to school administrators attempting

to organize a school library. The 1945 standards established the model that still impacts school library media programs today and established AASL as the authority in the field. The 1960 standards recognized the impact of the school library media program on the educational goals of the school and the teaching role of the school library media specialist. They were also the first to discuss the importance of the collaboration between classroom teachers and the school library media specialist. The 1969 standards attempted to emphasize the inclusion of resources other than print items in school library collections and the perceived new role of the school librarian by eliminating the word “library” and using the terms media, media specialist, and media center. The 1975 standards placed a heavy emphasis on quantitative standards but also provided a set of guiding principles for each area of the standards. It also, as the title implies, addressed the role of the district, as well as the local school, in the development of school media programs. The emphasis in the 1988 standards was the role of the school library media specialist and library media program in the achievement of the school’s curricular goals. The term “library” was reinstated and used along with “media” (e.g., library media specialist and library media program). There was also a strong emphasis on collaboration with the various members of the school community. The major addition to the new edition of the 1988 standards, published in 1998, is the *Information Literacy Standards for Student Learning*.^[21] In 2009 the Association published a new set of guidelines, *Empowering Learners: Guidelines for School Library Media Programs*. These new guidelines reflect the heightened influence of technology and evidenced-based learning on school library media programs and the necessity of producing successful learners skilled in multiple literacies.^[22]

Other National Guidelines and Standards

In 1998, AASL collaborated with the Alliance for Curriculum Reform in the development of the National Study of School Evaluation’s (NSSE) standards-based guide for program evaluation of library media services. This publication, *Program Evaluation: Library Media Services*,^[23] is one volume of the study’s Indicators of Quality Program Evaluation Series. The NSSE serves as the research and development branch of the regional accrediting commissions, which accredit the educational programs of elementary, middle, and secondary schools and colleges and universities. Its board of directors is composed of representatives from each of the six regional accrediting associations in this country. The director of the project to develop the guide extended a special thanks to the members of the AASL staff, Julie Walker and Barbara Herrin, and members, Betty Marcoux, Carol Newman, and Barbara Stripling, for their extensive contribution to the development of the guide.^[24]

The AASL, with 11 other national associations, was a partner of the International Society for Technology in Education (ISTE) in their development of the *National Educational Technology Standards for Teachers* and *National Educational Technology Standards for Students*. The standards were developed as a part of the ISTE initiative, National Educational Technology Standards, funded by the National Aeronautics and Space Administration in consultation with the U.S. Department of Education, the Milken Exchange on Education Technology, and Apple Computer. The student standards were designed to provide teachers, technology planners, and other educational decision makers a framework to establish learning environments supported by technology. The framework incorporates educational technology skills into relevant curricular areas.^[25] The intent of the teacher standards is to establish a set of performance-based standards for the institutions preparing teachers in order for teachers to be able to provide a technology-supported learning environment for students.^[25]

MAJOR GRANT PROJECTS

Knapp Project

In 1962, the Knapp Foundation provided a grant in excess of \$1 million to AASL to develop model elementary and secondary school library programs through improving library resources and personnel. Peggy Sullivan from Montgomery County, Maryland, was appointed project director. The Knapp School Libraries Project was to be developed in three phases with the funding spread over a 5-year period. The purpose of the project was to establish model programs throughout the country that could be visited by librarians, educators, and community members in order that they might replicate these model school libraries in their communities.^[6]

In 1968, the Knapp Foundation made a second grant of over \$1 million to AASL for the Knapp School Library Manpower Project. The grant was made in response to the identified need for qualified school librarians in the field. Robert N. Case was appointed the project director and Anna Mary Lowrey was appointed the associate director. The purpose of the program was threefold: 1) perform a task and job analysis of professional and nonprofessional school library staff members; 2) identify a manpower pool for recruitment to the profession; and 3) identify experimental and demonstration educational programs for the development of school librarians.^[6]

DeWitt Wallace *Reader’s Digest* Library Power Project

From 1988 through 1998, the DeWitt Wallace *Reader’s Digest* Fund provided major funding, through a grant to

the ALA, for the AASL to coordinate the National Library Power Program. Ann Carlson Weeks served as the national coordinator of the project from its beginning until she left AASL; Donald Adcock was named to fill that position until the conclusion of the project. This \$41 million initiative provided 19 communities with 3-year grants to improve school library media programs. Funding to the local communities was made to local education funds rather than directly to the schools. The AASL coordinated the national program, provided administrative and technical assistance to the 19 Library Power sites, and collaborated with the Public Education Network, who provided technical assistance to the local education funds. The initiative was based on *Information Power: Guidelines for School Library Media Programs*. Its purpose was to “create a national vision and new expectations for public elementary and middle school library programs and to encourage new and innovative uses of the library’s physical and human resources.” Library Power provided funds for professional development for teachers, administrators, and school library media specialists; to renovate school library media centers; to match local funds for library books and other library resources; and to hire project staff. To participate in the program, the local school agreed to provide a full-time, certified school library media specialist, keep the library open throughout the school day with schedules that provided for open access to the library, support release time for staff to attend Library Power professional development activities, and cover labor costs for renovation and remodeling of school library media facilities. Library Power projects were located in the following cities: Atlanta, Georgia; Baton Rouge, Louisiana; Berea, Kentucky; Cambridge, Massachusetts; Chattanooga, Tennessee; Cleveland, Ohio; Dade County (Miami), Florida; Denver, Colorado; Lincoln, Nebraska; Lynn, Massachusetts; Mon Valley (McKeesport), Pennsylvania; Nashville, Tennessee; New Haven, Connecticut; New York, New York; Paterson, New Jersey; Philadelphia, Pennsylvania; Providence, Rhode Island; Tucson, Arizona; and Wake County (Raleigh), North Carolina.^[26] In 2001, The AASL and the Public Education Fund collaborated with the ALA to publish *The Information-Powered School*, edited by Sandra Hughes-Hassell and Anne Wheelcock. Each chapter of the publication deals with a specific aspect of Library Power and was written by a member of one of the 19 sites. The intent of the publication is to show how other schools can use the lessons learned by the Library Power participants to implement any part, or all, of Library Power.

CONCLUSION

As it has throughout its history, the AASL will continue being the professional school library organization that provides a national voice that advocates providing each

student in elementary and secondary schools access to a school library media program with access to the inviting environment of a school library media center and the human and intellectual resources that allow them to become effective users of information. It will continue to be the voice that calls attention to the importance of providing each school with a qualified school librarian to work with other members of the school community to provide students with the skills necessary to locate, select, evaluate, and use information effectively. The AASL will continue to collaborate with other national educational organizations to advocate for the improvement of the quality of elementary and secondary education and the preparation of those who work with children and youth in our schools. American Library Association (ALA)

Mary W. Ghikas

American Library Association, Chicago, Illinois, U.S.A.

Abstract

The American Library Association (ALA) was founded in 1876 in Philadelphia, at a conference held at the Pennsylvania Historical Society. The defined purposes of the ALA are fundamentally public service purposes—primarily public and educational, rather than professional. ALA is, therefore, characterized as a nonprofit corporation under Section 501(c)(3) of the U.S. Internal Revenue Service code and has, from its formation, been open to “any person, library, or other organization interested in library service and librarianship. . . upon payment of the dues provided for in the Bylaws.”

INTRODUCTION

The American Library Association (ALA) was founded in 1876 in Philadelphia, at a conference held at the Pennsylvania Historical Society. The purposes described in the enabling resolution would later be expressed succinctly in Article II of the ALA Constitution: “The object of the ALA shall be to promote library service and librarianship.”^[1] This founding conference grew from an 1853 meeting in New York, initiated by Charles B. Norton, publisher; Hastings Grant, librarian of the New York Mercantile Library; Charles Jewett, librarian of the Smithsonian Institution; and others. A committee was appointed in 1853 and charged to draft a constitution and bylaws—and to call a second meeting.^[2]

Civil war and its aftermath delayed that second conference. Then, with the United States moving toward its centennial, various library leaders suggested a congress of librarians. On April 22, 1876, a letter from James Yates, a public librarian from England, was printed in Frederick Leypoldt’s “Library and Bibliographical Notes” column in R.R. Bowker’s *Publishers Weekly*, commenting on the fact that no congress of librarians had been called, though other scientific, educational, and professional groups were convening. The call was picked up and pushed forward by Melvil Dewey, then librarian of Amherst College. *Publishers Weekly* advertised both the impending conference and the birth of the *American Library Journal* in September 1876.^[3]

The conference arrangements committee for the Philadelphia conference included: Justin Winsor, Boston Public Library; Lloyd P. Smith, Philadelphia Library Company; and William F. Poole, Chicago Public Library. One hundred and three persons attended the conference, including 13 women. Justin Winsor was elected president (1876–1885) and Melvil Dewey was elected secretary.^[2]

In 1879, the ALA was officially incorporated under the laws of the commonwealth of Massachusetts, by Justin

Winsor, C.A. Cutter, Samuel S. Green, James L. Whitney, Melvil Dewey, Fred B. Perkins and Thomas W. Bicknell. The language of the charter echoed the founding resolution:

for the purpose of promoting the library interests of the country by exchanging views, reaching conclusions, and inducing cooperation in all departments of bibliothecal science and economy; by disposing the public mind to the founding and improving of libraries; and by cultivating good will among its members. . .

In 1942, the Charter was revised, restating the purposes of the Association to include “promoting library interests throughout the world,” and adding that the Association might fulfill its mission “by such other means as may be authorized from time to time by the Executive Board or Council of the ALA.”

ALA VALUES, PRIORITIES, AND MISSIONS

In 1986, the ALA Council approved this mission statement:

The mission of the American Library Association is to provide leadership for the development, promotion, and improvement of library and information services and the profession of librarianship in order to enhance learning and ensure access to information for all.^[4]

The 1995 report of the ALA Organizational Self-Study Committee (OSSC), comparing this mission to the 1879 charter, as amended in 1942, noted: “The fact that they are similar is one of the enduring strengths of ALA.”^[5]

Over the years, ALA has defined its directions and priorities within the broad contexts of social, economic, and political change. A 1986 statement of organizational and operational priorities notes: “Any organization as

large, diverse, and dynamic as ALA must periodically reassess priorities. . . .”^[6]

In 1959, the ALA Council adopted the first *ALA Goals for Action*; a revision was approved in 1967. The 1984 *ALA Annual Report* noted formation of a Process Planning Group to guide ALA’s “first comprehensive long-range planning process”—Strategic Long-Range Planning (SLRP). The following year, the ALA Office for Research and Statistics surveyed over 450 members of the leadership and general membership. On January 9, 1985, ALA Council approved the process outline. A planning session at the 1985 ALA Annual Conference was attended by more than 400 individuals.

From this process, six “priority areas” were defined in 1986.^[7]

- *Access to information:* ALA will promote efforts to ensure that every individual has access to needed information at the time needed and in a format the individual can utilize, through provision of library and information services.
- *Legislation/funding:* ALA will promote legislation at all levels that will strengthen library and information services. Means will be developed for facilitating the effective competition of libraries for public funds as well as for funds from the private sector.
- *Intellectual freedom:* ALA will promote the protection of library materials, personnel, and trustees from censorship; the defense of library personnel and trustees in support of intellectual freedom and the Library Bill of Rights; and the education of library personnel, trustees, and the general public to the importance of intellectual freedom.
- *Public awareness:* ALA will promote the role of librarians and the use of libraries and their resources and services as well as the awareness of their importance to all segments of society.
- *Personnel resources:* ALA will promote the recruitment, education, professional development, rights, interests, and obligations of library personnel and trustees.
- *Library services, development, and technology:* ALA will promote the availability of information tools and technologies which assist librarians in providing services responsive to the changing needs of society.

These six priority areas were supported by three “organizational support goals,” which defined organizational philosophies regarding roles and relationships, finances, and human resources.

These priorities remained in the ALA Policy Manual until 2006.^[8] Over the next two decades following 1986, ALA approved additional statements of goals and programmatic priorities. There is striking continuity in the successive goals and statements, across several generations of leadership.

On February 6, 1995, the Association approved ALA Goal 2000, which called for the ALA to be “as closely associated with the idea of the public’s right to a free and open intellectual society—intellectual participation—as it is with the idea of intellectual freedom.” Originally presented to the ALA Executive Board in October 1994, by then executive director Elizabeth Martinez, the plan’s tactical recommendations included expansion of the ALA Washington Office, establishment of an Office of Information Technology Policy and establishment of an independent charitable foundation called the Fund for America’s Libraries.^[9]

Arising from analysis of Goal 2000, the ALA Executive Board defined five “key action areas”—arenas in which the Association must be active in order to fulfill its mission and ALA Goal 2000. Beginning January 13, 1998, at the Midwinter Meeting in New Orleans, the ALA Council approved these “key action areas” annually, through 2005, as the Association’s current “programmatic priorities”: diversity, intellectual freedom, equity of access, twenty-first century literacy, and education and continuous learning.

As 2000 approached, ALA leaders began development of a new statement of vision and goals. In July 2000, the ALA Council approved ALAction 2005, including the following goals:

- By 2005, ALA will have increased support for libraries and librarians by communicating clearly and strongly why libraries and librarians are both unique and valuable.
- By 2005, ALA will be recognized as the leading voice for equitable access to information resources in all formats for all people.
- By 2005, ALA will be a leader in the use of technology for communication with, democratic participation by, and for shared learning among its members.
- By 2005, ALA will be a leader in continuing education for librarians and library personnel.

With the approach of 2005, the Association again looked at its strategic directions. This time, the ALA Executive Board and ALA Management undertook the most ambitious effort, since the 1980s, to secure member input: focus groups at the American Association of School Librarians (AASL) (Fall 2003) and Public Library Association (Spring 2004) National Conferences and at the 2004 ALA Midwinter Meeting and Annual Conference, including one focus group specifically related to academic libraries; open ALA Forums at chapter conferences, including student chapters; an email questionnaire completed by 17,000 members; analysis of planning documents from ALA divisions and other groups; telephone interviews with nonmembers; collection of a broad array of external environmental scan information; and, widespread dialogue with leadership.

In Fall 2004, the ALA Executive Board, ALA Division presidents, ALA Round Table representatives, and senior ALA and Division staff met to develop the first stage of a 2010 plan. The process continued at the 2004 joint meeting of the ALA Executive Board and executive committees of the 11 divisions. Following review of a draft plan by ALA divisions, round tables, committees at others at the 2005 ALA Midwinter Meeting, a proposed plan—ALA Ahead to 2010—was distributed for review and approved by the ALA Council at the 2005 ALA Annual Conference.^[10]

The approved plan includes six major goal areas, each with several specific objectives:

Goal Area I: Advocacy/Value of the Profession: ALA and its members are the leading advocates for libraries and the library profession.

Goal Area II: Education: Through its leadership, ALA ensures the highest quality graduate and continuing education opportunities for librarians and library staff.

Goal Area III: Public Policy and Standards: ALA plays a key role in the formulation of national and international policies and standards that affect library and information services.

Goal Area IV: Building the Profession: ALA is a leader in recruiting and developing a highly qualified and diverse library work force.

Goal Area V: Membership: Members receive outstanding value for their ALA membership.

Goal Area VI: Organizational Excellence: ALA is an inclusive, effectively governed, well-managed, and financially strong organization.^[11]

In Fall 2005, the ALA Executive Board recommended revised programmatic priorities—or key action areas—to increase alignment with the new plan. The revised programmatic priorities are diversity, equitable access to information and library services, education and lifelong learning, intellectual freedom, advocacy for libraries and the profession, literacy and organizational excellence. The new priorities have been presented to and approved by the ALA Council annually since January 2006.^[12]

MEMBERSHIP AND ORGANIZATIONAL CHANGE

The defined purposes of the ALA are fundamentally public service purposes—primarily public and educational, rather than professional. ALA is, therefore, characterized as a nonprofit corporation under Section 501 (c) (3) of the U.S. Internal Revenue Service code and has, from its formation, been open to “any person, library, or other organization interested in library service and librarianship...upon payment of the dues provided for in the Bylaws.”^[13]

As of August 31, 2007, ALA membership included the following personal membership categories: Regular, Student, Library Support Staff, Trustees and Friends, Associate Members (including those not employed in library and information services or related activities), Retired, Non-Salaried, and International, as well as Life Members and Continuing Members. Within each category, dues are flat rate—not on a salary-based sliding scale, with the exception that a new (first-time) member pays a reduced rate during the first and second years of membership. In 1986, the membership year changed from the calendar year to the “anniversary” year, marked from the month in which the member initially joined the Association. Organizational membership (based on budget size) and corporate membership (patron or contributor) is also available.

Basic ALA membership does not include membership in any ALA division or round table, which is separately selected with (as of August 31, 2007) approximately 67% of ALA membership belonging to one or more division or round table. In aggregate, almost as many division and round table membership are purchased (approximately 61,000) as ALA personal memberships (approximately 62,000). All division and round table members must first be members of the ALA.

As early as 1918, when ALA membership was 3380 (smaller than many current ALA divisions), the question “is ALA too big?” was raised.^[2] In 1989, a major milestone was reached when Wendy Sinnott became the 50,000th member of ALA. Ten years later, 1998–1999, ALA experienced its largest 1-year growth—adding 3459 members in 1 year, for a total of 58,777.

On August 31, 2007, the ALA had 3480 organizational members, 266 corporate members, and 60,983 personal members—a total of 64,729. ALA’s membership retention rate has been notable, ranging from 85% to 87% over a 10-year period.

ORGANIZATIONAL DEVELOPMENT: GROWTH AND DEMOCRATIZATION

ALA has sought, from its earliest history, to maintain an organizational structure characterized by democratic processes, individual member participation, and effective operations—though the understanding of these has varied significantly.

The original ALA constitution called for members to elect an executive board of five members, which in turn had the power to select additional members and to elect officers from the executive board so constituted. Nominating and election practices resulted in a largely self-perpetuating and homogenous governance body.^[3] In 1892, the constitution was revised to add the ALA Council. Recommendations in regard to library policy and creation of new sections within ALA both required Council action. This first council consisted of 10 councilors, elected by the

membership. At the same time, the constitution established direct election of officers.^[14] The 1899 constitution did not clearly delineate the division of power between the council and the executive board. With the 1909 constitutional revision, the council grew to include the executive board (*ex officio*), all ex-presidents of the Association, and 50 additional members, one-half chosen by Council and one-half chosen by the membership. No questions of policy could be voted by the membership without prior consideration by Council. The “business affairs” of the Association were entrusted to the executive board.^[14] In 1919, further revisions made the Executive Board the governing body of the Association—a move viewed with some suspicion by many members.^[14] Further constitutional revisions would continue to alter the composition of both the Council and Executive Board and to redefine the distribution of powers.

PERIODIC SCRUTINY

In 1928, at the West Baden, Indiana, conference, the ALA Council approved a special committee report which recommended:

A periodic scrutiny of Association activities within 3 years and not less frequently than every third year thereafter, by a committee appointed by the president, such scrutiny to include as complete consideration of the effectiveness and results of the various activities as is warranted and practicable, with a view of suggesting to Council possible changes of policy.^[15]

Over the next two decades, four such committees were appointed.

The First Activities Committee report (December 1930) covered library extension, adult education, education for librarianship, foundation projects, financing, publishing, membership, personnel practices, and ALA headquarters. The Second Activities Committee report (December 1934) noted the ALA Executive Board’s increasing tendency to systematically review the Association’s activities and recommended that committees be appointed to survey the Association’s activities only every 6 years, unless particular circumstances warranted more frequent survey.

Five years later, in 1939, the Third Activities Committee produced a report calling for a more democratic organization, particularly for a revised Council that would be completely elective, based on specific interests and on geography,^[14] as well as establishment of a sliding scale of membership dues, based on individual salary or (for institutional members) library budget. Also included in the report were recommendations to give more authority to sections within the Association and call them divisions,

and to give those divisions an allotment of 20% of the dues paid by their members to ALA.

In 1949, against a background of fiscal concerns, the report of the Fourth Activities Committee was presented to the ALA Council in two parts. Its recommendations would lead, by 1951, to an increase in dues—referred to a mail vote of the membership and approved.^[16]

TAKING THE MODERN SHAPE: CRESAP, MCCORMICK, AND PAGET

For ALA’s next “periodic scrutiny,” authorized by the ALA Executive Board in July 1954, the management consulting firm of Cresap, McCormick, and Paget was employed.

The final report, based on intensive study of the ALA membership organization, headquarters organization, and fiscal policies and practices, was discussed by Membership and unanimously approved by the ALA Council in July 1955, in Philadelphia. Among the major recommendation of this report were the following:

- Establishment of divisions by type of library and type of activity.
- Assignment of greater responsibility to Council.
- Closer relationship between the Council and the Executive Board.
- Appointment of divisional executive secretaries by the ALA executive secretary, with the approval of the division concerned.
- Simplification of the dues structure.

The special committee appointed to guide implementation of the management report adopted several guiding principles: (1) a closer relationship between the organization and its 20,000 members, accompanied by greater membership participation; (2) decentralization of responsibility and authority; (3) strengthening of the Council as the governing body of the organization; and (4) allowance for more planning, control, and flexibility in managing the financial resources of the organization.^[14]

By the late 1950s, the present shape of the ALA became visible. The divisional framework was restructured and type-of-library and type-of-activity divisions were designated, with some decentralization of responsibility. The ALA Council was clearly designated as the policy-making body of the Association. The Executive Board was elected by Council from among its members, to act for Council. Council representation became more democratic—with some councilors representing geographic areas, some divisions, some elected at-large. Member oversight of the budget was assigned to the Program Evaluation and Budget Committee, its membership then made up of past officers of the 12 divisions, plus the ALA treasurer, immediate past president and president-elect.^[14]

REVOLUTION AND REFORM: ACONDA/ANACONDA

Arising from the social turmoil of the 1960s, forces for continuing change within ALA reached the stage of “revolution” at the 1968 annual conference in Kansas City and the 1969 conference in Atlantic City. From Kansas City, the momentum was maintained by the “Congress for Change” in Washington, DC, as well as New York organization of “Librarians for 321.8” and “Libraries to the People”—culminating at the Atlantic City conference. Requested changes ranged from asking Council candidates for a statement of views, to taking activist roles in intellectual freedom, library education, and recruitment for the profession.

Incoming president William Dix suggested appointment of a committee to examine the objectives and program of ALA. The Activities Committee on New Directions for ALA (ACONDA) was appointed and charged “to recognize the changes in the interests of ALA members,” to provide “leadership and activities relevant to those interests,” to reinterpret and restate “the philosophy of ALA to provide a meaningful foundation which is capable of supporting a structure and program which reflects the beliefs and priorities of the profession.” It was also to reexamine priorities and organizational structure.^[17]

The committee’s final report, presented at the 1970 conference in Detroit, suggested a broad array of changes, including changes to the composition of Council, the nominating process, Association communications, the number and types of divisions, and ALA organizational structure. The resulting furor resulted in Membership Meetings which lasted 15 hr—and did not cover all the recommendations.^[18]

Council approved the first three ACONDA recommendations in July 1970:

1. ALA’s “overarching objective” would remain improvement of library service and librarianship. It would continue to be an organization of libraries and librarians.
2. An Office for Social Responsibility—changed by Council to Office for Library Service to the Disadvantaged—would be established.
3. The Intellectual Freedom Office would be expanded.

To aid in completely articulating the remaining recommendations, Council charged an Ad Hoc Council Committee (later dubbed ANACONDA) to work in conjunction with ACONDA. Their work was considered by Membership and Council through 1971. At the Midwinter Meeting in 1971, ACONDA/ANACONDA reiterated ACONDA’s strong recommendation that ALA needed restructuring, with ACONDA pointing out issues of overlapping interests and duplication of effort.

ACONDA criticized the makeup of Council, recommending a smaller council elected on a district basis. ANACONDA recommendations also attempted to deal with problems of democratization and reorganization.^[14] At the 1971 Annual Conference, Council passed a new policy statement implementing bylaws provisions for Council membership. All Council terms would end at the close of the 1972 Chicago conference and a new Council would be seated for the first time at the 1973 Midwinter Meeting. With this change, ALA past presidents were no longer automatically members of Council.^[19]

ACONDA/ANACONDA would have an impact on subsequent strategic planning within the Association, leading to establishment of a Planning Committee “to provide the thorough planning necessary to achieve the long-range goals of the association.”^[20] The strategic planning role was later moved to the ALA Executive Board following the work of the Official Self-study Committee. ACONDA/ANACONDA also resulted in adoption of statements of goals and objectives, though there was a lack of clarity regarding priority.^[21]

In 1977, the Future Structures Committee would note “there is no established means by which the individual member’s priorities can be tapped to provide a firm basis on which to assign the association’s resources,” and recommended that a member survey be undertaken. That survey was conducted in 1979, with results released in 1980. The survey results, along with ACONDA/ANACONDA reports, recommendations from the 1st White House Conference on Library and Information Services and other reports, formed the basis for recommended priorities, considered by Council in 1981.^[20]

CONTINUED CHANGE: THE HOLLEY COMMITTEE TO OSSC

In 1981, the Special Committee to Review Program Assessment Processes and Procedures (SCRAPP), chaired by Edward G. Holley, identified Association needs in the area of planning and budgeting: for clearly understood common purposes; a clear set of goals, objectives, and priorities; balance between overall association interests and unit (i.e., division or round table) interests; more effective use of resources—including staff and member time, as well as dollars; resource allocation based on priorities; and a process for ongoing planning and evaluation.^[22]

The Executive Board’s management role was one focus of SCRAPP (commonly known as “the Holley Committee”).^[23] The report noted: “There is no formal mechanism within ALA which brings together within a total management system the authority and the responsibility for planning, resource allocation, and program assessment.” The special committee recommended that the ALA Executive

Board assume responsibility for overall financial planning and control. That recommendation would be echoed in the mid-1990s in Part I of the report of the OSSC.^[24]

In January 1985, the ALA Council approved an outline for SLRP. The Council-approved document pointed to ALA's "tradition of flexible patterns of participation by individuals and groups who address association-wide and unit goals and an enormous range of issues facing libraries and librarians."^[25] It articulated roles and responsibilities: for Council and its sub-entities—the Committee on Program Evaluation and Support (COPEs) and the Planning and Budget Assembly (PBA), for the Executive Board and its sub-entities—the Directions and Program Review Committee and Process Planning Committee, for consultants, and for staff. The SLRP was to be characterized by broad communication and participation, and opportunities to address "critical issues," would result in clear goals and objectives, and would be evaluated continuously. In 1986, ALA adopted the resulting "priority areas" which remained in ALA's policy manual until 2006.^[8] Indeed, the continuity between these priorities and subsequently adopted programmatic priorities is striking.

ORGANIZATIONAL SELF-STUDY: 1992–1995

In June, 1992, then president-elect Marilyn Miller, with Council approval, appointed an ALA Self-study Committee, chaired by past-president William Summers. The proposal to the Executive Board and Council noted:

There has been neither an internal nor an external study of ALA since the 1955 ALA Management Survey conducted by Cresap, McCormick, and Paget. Since the reorganization prompted by the Cresap study, the ALA structure has remained virtually unchanged except for those modifications we have made to respond to democratization and to accommodate new units.

The proposal further noted that the "present pattern of division fiscal responsibility is a given," that "management by coalition based on coalescing principles will continue to be the predominant management force..." and that the then-present (1986) ALA goals and objectives should stand.^[26]

Phase I of the Self-study was a management study, conducted by Consensus Management Group and focused primarily on the roles and responsibilities of the ALA Council, ALA Executive Board, and ALA Executive Director. Phase II of the OSSC Report, in January 1995, contained recommendations relating to management and governance of the association. Among the recommendations implemented were provision for membership ballot initiatives; an increase (to 1% of membership) in the number of members required to petition for a mail vote to overturn an action of Council; elimination of the ALA

Planning Committee, with responsibility for strategic planning clearly designated as an Executive Board role; a restructuring of fiscal oversight processes, with the COPEs becoming the Budget Analysis and Review Committee and including significant representation from the Executive Board; a decrease in the term of members of the Council and Executive Board from four to three (excluding the ALA Treasurer), whose term remained at four until subsequently reduced to 3 years in 2003, when ALA members ratified the action taken by Council in June 2002.

Among the OSSC management and governance recommendations either not considered or rejected were term limits for members of ALA Council and elimination of the Membership Meeting in favor of a Membership Forum. In initially proposing the latter, the committee noted:

The Membership Meetings at Annual Conference have been a cause of concern for a number of years. Attendance at the meetings is very low, representing a small proportion of the members attending the conference and a very low proportion of the total membership. Yet at these meetings, questions are posed and actions recommended, which have far reaching consequences for the Association.^[27]

In subsequently deciding not to seek approval of that recommendation, the committee noted that membership had recently (1994) approved an increase in quorum size for a Membership Meeting. The issue remained a significant one within the Association. At the 2001 Annual Conference, Council requested establishment of a Special Presidential Task Force on Membership Meeting Quorum. Recommendations of that task force led to reduction of the quorum to one-half of 1% and removed the authority of the Membership Meeting to set aside actions of Council. In 2003, a Membership Meeting Committee (standing) was established to plan the agenda for Membership Meetings, identify topics of potential interest for discussion, and encourage participation. In 2005, the quorum for the Membership Meeting was reduced to 75 personal members.^[28]

FOLLOWING CONTROVERSY

The OSSC also made extremely controversial structural recommendations. As a result of the heated discussions within both the ALA Membership Meeting and ALA Council, in 1995 the ALA Council established an Ad Hoc Task Force on Structure Revision (SRTF), chaired by Sarah M. Pritchard.

Its report to Council, February 1997, noted:

The SRTF is not recommending major structural revision of the divisions and other membership groups since we

believe that, to be effective, such change must come from the direct collaboration and initiative of those groups rather than as a top-down design. . . . Nor do we believe the general governing concept of a delegate council and an executive board needs to be changed. These structures have a long tradition in the ALA and extensive member support; the effort to change them might well distract us from our primary professional goals for years on end with no guarantee that a different structure would be any more effective. We propose to concentrate instead on improving, enhancing and modernizing the operations we now have.

Acknowledging other ongoing work within the Association (including ALA Goal 2000 and establishment of new committees such as the ALA Conference Committee), the SRTF determined to focus its efforts on the structure of Council.^[29] The SRTF presented its final report in June 1997. Among the resulting changes was the addition of six round tables representatives to the ALA Council.

ORGANIZATIONAL DEVELOPMENT: ALA DIVISIONS AND THE ALLIED PROFESSIONAL ASSOCIATION

It was clear early in ALA's history that provision would have to be made for specialization, to accommodate various institutional perspectives and the growing diversity of librarianship itself. In 1889, the college and reference librarians formed the first special section and held their first separate meeting apart from the general body of the Association. In 1890, the trustees formed a special section, followed by the catalogers in 1900.

With acceptance of the recommendation of the Third Activities Committee (December 1939), ALA's growing sections gained increased authority within the Association and became divisions. In 1952, grants were made to divisions from ALA endowment capital to enable them to have executive secretaries, based on the ALA Executive Board's conviction that staff would enable divisions to develop and maintain more effective programs for their members and the entire Association. The resulting division membership gains were to fund staff following expiration of the grants.

DIVISIONS AFTER 1955

The 1955 Cresap, McCormick, and Paget report defined type of library and type of activity divisions, headed by executive secretaries appointed by the ALA executive secretary. Among the specific provisions were that each division encompasses a field of activity clearly distinct from that of other divisions, that basic ALA dues include one type-of-activity and one type-of-library division, and that

the "60-40" allocation of dues be replaced by an allotment proportional to number of members, with additional funding based on proposals to the Association's budget committee. This report shaped the basic divisional structure in operation today. The final reorganization eventually resulted in the formation of 12 divisions and 6 round tables.

By 1975, with ALA membership at 33,491, 73% of ALA members selected at least one division. By 1976, with membership at 34,491, it was 64%. In 1982, with total ALA membership at 38,330, 65% of ALA members selected at least one division. That percentage proved to be reasonably stable. In 1984, with 39,000 ALA members, 66% selected at least one division. By January 2007, 67% selected at least one division or one round table, with 7 of 10 being Division memberships and 3 of 10 round table memberships.

THE DUES SCHEDULE TRANSITION DOCUMENT

Based on the recommendations of a succession of reviews, by the 1970s ALA had moved to the principle of funding divisions from income derived from division dues and other division activities. This required a basis on which to separate those areas of division financial responsibility from those of the ALA "General Fund." That basis was provided by the "Dues Schedule Transition Document," adopted by the ALA Council in January 1976.

The "Dues Schedule Transition Document" ended inclusion of division membership within the ALA basic dues; members now paid additional dues to each division joined. Divisions became largely self-supporting at this point, assuming financial responsibility for cost of staff, publications, and programs. The ALA General Fund assumed responsibility for a defined set of "indirect cost" items, including office space, administrative services (including both fiscal and human resources services) and other similar kinds of expenses. In 1975, ALA divisions spent just under \$600,000 for programming. By 1980, division expenditure on programming reached \$1.3 million and by 1983, a short 3 years later, exceeded \$2 million. With the passage of time, the several revisions of the ALA dues structure, and the move into the new headquarters building, by April 1982 it was time for a new statement.^[30]

THE OPERATING AGREEMENTS

Responsibility for preparation of a new statement outlining the fiscal relationship between ALA and its divisions was given to the COPEs. Initial discussions between COPEs and divisions began in 1981 and resulted in a draft operating agreement, which was presented to ALA Council in July 1982, and approved as an "Operating

Agreement between ALA and its Membership Divisions.” This operating agreement articulated its primary purpose as

to define those services which divisions receive from ALA at no cost and those for which charges are made to divisions. In addition, the document seeks to establish a cooperative framework in which the inevitable questions of organizational relationship can be addressed and resolved.^[31]

The document approved called for revision in not more than 5 years.

In 1984, executive directors of ALA divisions met with COPEs to discuss the relationship between the divisions and ALA. In December 1986, a revised draft was presented to COPEs. Members of COPEs, division representatives, ALA officers and staff met in Lisle, IL, November 11–13, 1988, to discuss revision of the 1982 Operating Agreement. The current “Policies of the American Library Association in Relation to Its Membership Divisions” was approved by the ALA Council on June 28, 1989.^[32] It was implemented through a series of “management practices,” providing the flexibility to accommodate changes in technology and other conditions.

The 1989 Operating Agreement was based on four “fundamentals:”

1. ALA and all its units abide by the ALA Constitution, Bylaws, and policies adopted by the ALA Council.
2. ALA is one legal, financial, and organizational entity, with indivisible assets.
3. All staff are employees of the ALA, and subject to ALA personnel policies.
4. All ALA units use services provided by ALA (including such services as personnel, membership services, telephone, insurance, purchasing, fiscal services, legal services, archives and general administrative services) and are housed in property owned or leased by ALA.^[31]

Just prior to the 1988 Lisle meeting, addressing a concurrent meeting of the division executive committees, then ALA executive director Thomas Galvin said:

In the words of the ALA Business Plan, “ALA as a whole and its individual units exist in an environment of mutual programmatic and financial interdependence.” ALA is only as programmatically strong as its most fragile unit, only as financially robust as its most impoverished entity....^[33]

DIVISIONS AND THE SELF-STUDY

In their 1995 Phase II Report, the OSSC defined “guiding principles” as a context for organizational change and also noted current issues or concerns:^[5]

1. “ALA provides holistic participation in the Association.” OSSC noted overlap among divisions (and other units) as they responded to emerging issues and sought to address the various concerns of their members.
2. “ALA’s governance structure fosters quick, concerted, and coordinated national action.” Here the committee noted that members “experience frustration” when an opportunity to act on an issue quickly is lost because of the need to consult with many different units.
3. “ALA speaks externally with one voice.” OSSC noted the need to provide opportunities for internal disagreement, examination of different perspectives, and development of consensus, in order to “ensure that ALA speaks with one voice in its external communications.”
4. “Governance structures facilitate decision-making and consume a minimal amount of the Association’s resources.” The committee recommended a “flatter” and “more streamlined” governance structure.
5. Membership in ALA is a satisfying, positive professional experience.

Believing that responses to a 1994 “concept paper” distributed by the OSSC indicated support for these guiding principles, the OSSC proposed a broad range of organizational changes, including expanding networks with state and regional groups, consolidating organizational units, regrouping or clustering existing units, replacing some units with different ones, implementing an active “sunrise” philosophy, adding new offices and creating new groupings such as “policy councils.” These recommendations proved controversial—and were not adopted. The Membership Meeting at which the proposal was discussed (Chicago, 1995) was one of the few during the late nineties to achieve a quorum.

FORMATION OF THE ALA-ALLIED PROFESSIONAL ASSOCIATION

One of the recurring overtones in ALA’s long history is the pull—for resources and attention—between a focus on libraries and a focus on the individual library practitioner. This normal condition—stemming from ALA’s broad mission and scope—was exacerbated by the increasing body of law and regulation governing tax-exempt organizations.

In July 1996, boards of two ALA divisions—the Public Library Association (PLA) and Library Administration and Management Association (LAMA)—voted to support a proposal to establish a “certified public library administrator program.” Based on interest expressed by other divisions, PLA and LAMA, joined by the Association of Specialized and Cooperative Library Agencies (ASCLA),

recommended that ALA create a special committee to develop a “framework” certification proposal for ALA Executive Board approval. Until 2001, activity proceeded along several tracks: (1) the definition of such a “framework” by the ALA Committee on Education;^[34] (2) the continued development of a “standard for professional practice” by PLA and LAMA, now joined by the ASCLA; and (3) the definition of a legally permissible strategy to enable certification. In June 2001, the ALA Council approved the following statement:

Toward fulfillment of its declared mission to provide leadership for the development, promotion, and improvement of the profession of librarianship, the American Library Association establishes an allied professional association to certify individuals in areas of specialization beyond the ALA-recognized masters degree.^[35]

Overlapping this strand of ALA development were the issues of the salaries and status of librarians. In Spring 1999, the report of the 1st Congress on Professional Education recommended that ALA “address the need to improve salaries.” In Spring 2001, then-president Nancy Kranich, in response to issues raised by members, appointed a Task Force on the Status of Librarians, chaired by Tom Wilding, charged to articulate status issues, recommend strategies to address them and outline the issues that must be resolved in order to follow those strategies. In Fall 2001, ALA president-elect Maurice J. Freedman appointed a presidential initiative committee, chaired by Patricia Glass Schuman—the Better Salaries Task Force. In December 2001, the task force outlined Options for Action, recommending that the scope of the allied professional organization be broadened to enable it to undertake a variety of activities related to status and salaries.

In Fall 2001, the ALA Executive Board appointed a working group, including the chairs of both the Status Task Force and Better Salaries Task Force, to coordinate development of a proposal to broaden the scope of the Council-authorized allied professional organization.

At the 2002 Midwinter Meeting, the ALA Council approved preliminary Bylaws for an ALA Allied Professional Association, broadening its scope “to promote the mutual professional interests of librarians and other library workers.” An ALA–APA Transition Team, chaired by Nancy Kranich, was appointed in March 2002, reporting to Council in May 2002. The ALA–APA Board of Directors met for the first time at the 2002 Annual Conference. In July 2002, the ALA Allied Professional Association was incorporated in the State of Illinois. It subsequently received tax-exempt status under Section 501 (c) (6) of the U.S. Internal Revenue Code. In November 2002, the ALA–APA Board of Directors accepted a business plan for the ALA–APA and, based on that plan, requested a \$250,000 establishment loan from the ALA.^[36]

ALA STRUCTURE TODAY

ALA Council

The governing body of the ALA is the ALA Council. Council is empowered by the ALA Constitution to “determine all policies of the Association.” Its decisions are binding upon the Association, except when “set aside by a majority vote by mail in which one-fourth of the members of the Association have voted.”^[37] A majority vote of the Council may also refer a question of policy to the Association for vote at either a Membership Meeting or by mail. Only personal members of ALA may serve on the Council.

As of August 31, 2007, the ALA Council includes 186 members. There are 100 councilors at large, elected by ALA membership. Members of each of ALA’s 11 divisions elect one councilor. Members of the each round table whose membership is equal to or greater than 1% of the total ALA personal membership, as of August 31 of the year preceding the election, elect one councilor; members of the remaining round tables jointly elect one councilor. Finally, there are 53 chapter councilors, representing the 50 states, the District of Columbia, Guam and the Virgin Islands. Members of the ALA Executive Board, including the treasurer and immediate past president, are members of the ALA Council. Officers of the ALA Council are the ALA president and president-elect. The ALA executive director is the secretary of Council. Councilors serve a 3-year term. ALA Council must meet at least twice a year, once at the annual conference and once not less than 3 months prior to the annual conference, by current practice at the ALA Midwinter Meeting.

ALA Executive Board

The ALA Executive Board includes the president, president-elect, immediate past president, treasurer—all elected by the ALA membership—and eight members elected by the ALA Council from among its members. The ALA executive director is a non voting member of the Executive Board. Members of the Executive Board serve a 3-year term.

The ALA Executive Board “acts for the Council in the administration of established policies and programs.” The Executive Board “manages within this context the affairs of the Association,” delegating management of day-to-day operations to the ALA Executive Director. The Executive Board also makes recommendations to Council regarding policy.^[38]

ALA Divisions

ALA has 11 membership divisions, each focusing on a type of library or type of service. Divisions offer

programs, publications, institutes, and workshops; and provide other services to their members. Three divisions—the American Association of School Librarians, the Association of College and Research Libraries, and the Public Library Association—currently hold biennial national conferences. Division members must be members of the ALA. Division staff members are ALA staff members.

Each division has, by policy:

- A statement of responsibility developed by its members and approved by ALA Council.
- A set of goals and objectives established by its members, which drive its activities.
- An Executive Director and other personnel as necessary to carry out its programs.
- Responsibility for generating revenue to support staff and carry out its programs.
- A separate Board of Directors, elected by its members, and responsible to ALA Council.

ALA Bylaws [Article VI, Section 2 (b)] give divisions authority “to act for the ALA as a whole” within their Council-designated areas of responsibility. An operating agreement—ALA Policy 6.4.1 “Policies of the American Library Association in Relation to its Membership Divisions”—outlines a collaborative and intertwined relationship between ALA and its divisions. The policy notes that ALA:

...is unique among American associations in the manner in which it is structured. It is one association, with indivisible assets and a single set of uniform administrative, financial, and personnel policies and procedures. It is governed by one Council, from which its Executive Board is elected, and is managed by an Executive Director who serves at the pleasure of that Board. It is also the home for eleven Divisions. . . .^[32]

Each division is represented on the ALA Council, in the PBA and on other association-wide assemblies.

ALA Round Tables

In accordance with ALA Bylaws, Council may authorize organization as an ALA Round Table by any group of not less than 100 members of the Association “who are interested in the same field of librarianship not within the scope of any division. . . .”^[39] Interested members must petition for the formation of a round table and that petition must include a statement of the proposed purpose. As of August 31, 2007, ALA had 17 round tables.

Round tables may charge dues, issue publications (with the approval of the ALA Publications Committee) and affiliate with regional, state or local groups with the same interests. Round tables do not have their own staff. ALA

staff are assigned “liaison” responsibility for round tables. Round tables may not “commit the Association by any declaration of policy.”^[40] Round tables have been represented on the ALA Council since 1999–2000. In Spring 2006, ALA Membership ratified a change to Article VI of the Bylaws, to provide that any round table with personal membership equal to or greater than 1% of ALA’s total personal membership may elect one councilor. The remaining round tables, those with less than 1% of ALA’s total personal membership, jointly elect one councilor.^[41] As of June 2008, nine round tables were individually represented in Council, with a 10th, elected in the Spring 2008 election, to be individually represented beginning in 2008–2009.

Standing Committees

ALA Bylaws provide for standing, special, interdivisional and joint committees. Standing committees may be committees of the Association or committees of Council. By Council action (July 1969), the Executive Board and Council may also create ad hoc committees, to pursue a designated project for a specific period and not continuing beyond the life of that project. ALA currently has approximately 35 standing committees, including both Association and Council committees, as well as five joint committees—committees jointly created by the ALA and one or more external organization. Many standing committees have associated subcommittees, assemblies and other subordinate bodies. Approximately, 350 ALA members serve on these standing committees.

Member Initiative Groups

Membership Initiative Groups (MIGs) were initially authorized in 1979 at the Annual Conference in Dallas, with implementation guidelines approved in 1980. In 1985, ALA Council approved a recommendation from the ALA Committee on Organization (COO) that MIGs be continued and given organizational status in the Bylaws. Council and members subsequently approved a Bylaws amendment [Article VIII, Section 2 (b) (ii)] enabling COO to authorize MIGs. MIGs may not assume any of the delegated responsibilities of other units and may not speak for the Association. Originally conceived as a short-term organizational vehicle to provide for prompt, organized membership activity on topics of mutual interest, MIGs were limited to a 3-year life, after which they must either cease to exist or “apply for a place within the ALA structure.” In 2008, recognizing shifts in the way members sought to organize themselves for work, the COO authorized Member Initiative Groups to repetition for successive 3-year terms of existence. Since 2000, there have been four Member Initiative Groups formed: Libraries Fostering Civic Engagement, Information

Commons, Virtual Communities and Libraries, Games and Gaming.^[42]

Chapters

Under Article V of ALA's Bylaws, Council

may establish a chapter. . . in any state, province, territory, or region in which a majority of ALA members residing within the area involved and voting on the issue favors such action; provided, however, that the total number of persons voting on the issue shall not be less than ten percent of the total number of ALA members residing within the area.^[43]

Council representation is through the state chapter, unless chapters in a region choose to take representation through the regional chapter, in which case the regional chapter would elect one representative from each state or provincial chapter included in the region. As of August 31, 2000, all state chapter representation was through state chapters, not regional chapters. Chapters may admit members who are *not* members of the ALA.

It is important to note that many states have more than one library association. Particularly, school library media specialists frequently have separate associations. These separate school library media associations are generally affiliated with the AASL, a division of the ALA, but are not represented on the ALA Council. AASL has a separate Affiliate Assembly. Other ALA divisions also have state or regional affiliates.

Affiliated Organizations

The ALA Council may, by vote, affiliate with the Association or any of its subdivisions "any national or international organization having purposes similar to those of the Association or its subdivision."^[44] Likewise, it may affiliate the Association with such an organization. No subdivision of the Association may separately affiliate with an organization to which the Association as a whole is affiliated. Affiliated organizations are not represented in the ALA governance structure. Representatives of affiliated organizations meet informally at ALA conferences.

BEYOND STRUCTURE: INTERNATIONAL CONNECTIONS AND WEB-BASED NETWORKING

International Connections

From the earliest period of its history, ALA has seen its role and the interests of its members in an international context. James Yates, librarian of the Free Library of Leeds (England) was an invited delegate at the 1876 founding conference. A year later, following the 1877

conference in New York City, 12 American librarians went to England, where they were present at the organization of the Library Association of the United Kingdom. International contact continued to expand, with many international librarians attending the 1904 conference in St. Louis.^[2]

In 1917, the ALA Executive Board appointed the Committee on Mobilization and War Service Plans (later the War Service Committee). Herbert Putnam served as general director of the program. ALA undertook to supply books and periodicals to military personnel at home and overseas. The initial campaign raised \$1 million for camp libraries, as well as including a book drive.^[2] In August 1918, ALA opened a library for U.S. military personnel in Paris; others followed. Following the Armistice, there was significant pressure from Americans in France to keep these facilities open. ALA promised to leave the books and equipment and to provide a \$25,000 "endowment." On May 20, 1920, the American Library in Paris was incorporated as a private, nonprofit organization under the laws of the state of Delaware.^[45]

This spirit of missionary librarianship was further evidenced in the establishment of the Biblioteca Benjamin Franklin in 1942,^[2] as well as later projects such as the Keio Library School in Tokyo and the Institute of Librarianship in Ankara, both in the 1970s. In 1988, a delegation of Soviet librarians attended the ALA Annual Conference for the first time. In the United States, they signed a protocol opening the way to exchange of current national bibliographic data. ALA's international participation would accelerate by the beginning of the twenty-first century, through visits, workshops, and bi-national conferences around the globe.

In 1942, the ALA Council approved establishment of a "board" on International Relations. In October 1942, a grant from the Rockefeller Foundation made possible the establishment of the ALA International Relations Office in Washington, DC, in space donated by the Library of Congress, to "lend effective aid to libraries and advance the interests of librarianship."^[2] The office operated for the next 5 years using further grants, serving as secretariat to the International Relations Board. The scope of operations was broad, with funding from both the Rockefeller Foundation and the U.S. State Department to supply library science literature to libraries overseas, to distribute bibliographies, to assist in administration of library schools in Latin American countries, to administer the program for bringing foreign librarians to the United States to study and observe American libraries, to purchase American journals for distribution to newly forming libraries in the post-World War II period, and other projects.

The International Relations Board became ALA's International Relations Committee in 1956. That same year, another grant from the Rockefeller Foundation and a supplemental grant from the Council on Library Resources made possible the establishment of the

International Relations Office, operating both at the Chicago headquarters and in Washington, DC. Its original purpose was to offer assistance, direct or indirect, to the underdeveloped countries in Asia, Africa, Latin America, and the Near East, particularly promoting education for librarianship in those countries. The scope of the Office was later broadened. An international relations office existed 1943–1949 and again 1956–1972, when it temporarily fell victim to ALA financial stresses in the 1970s.^[2]

In 1986, ALA received a grant from USIA for the Library/Book Fellows Program, which was to continue until 1998—sending over 100 U.S. librarians to over 70 countries, and bringing 40 librarians from 35 countries to the United States. In 1989, the chair of the ALA International Relations Committee, E.J. Josey, reported to the ALA Executive Board on the outcomes of a November 1988 planning meeting convened to reassess ALA's international role, develop a strategy for identifying that role within ALA's organizational priorities, and achieve funding to support that role. Establishment of an International Relations Office within ALA was proposed—and in the late 1990s the ALA International Relations Office was established, using ALA operating funds rather than grant funds. It continues today.^[46]

The first steps toward an international library organization had been taken at ALA's 50th anniversary conference in 1926. The International Library Committee met in Edinburgh in 1927, the 50th anniversary of the Library Association, with ALA as one of the founding members. In 1952, the Committee became the International Federation of Library Associations.^[2]

Six U.S. based associations within IFLA—the American Association of Law Libraries, the ALA, the Art Libraries Society/North America, the Association of Research Libraries, the Medical Library Association, and the Special Libraries Association—together with U.S. IFLA members and the National Commission on Libraries and Information Science, joined together to sponsor the 1985 IFLA Conference in Chicago, drawing delegates from more than 86 countries. In 2001, IFLA again met in the United States, setting a new attendance record with approximately 5500 attendees in Boston.

ALA in the Networked World

By 2007, the impact of rapid expansion in use of social networking tools was visible within the Association. In Spring 2008, an informal census of “web 2.0” deployment revealed 70 blogs (doubled since Spring 2007), 125 wikis (quadrupled since Spring 2007)—both supplementing, and in some cases supplanting, the more than 948 discussion lists in use by ALA groups. Some 15 individuals a day were joining the ALA group in Facebook—which totaled 3800 by September 2008—and other ALA-related groups had formed on other social networking sites.^[47] ALA staff and members had held events—celebrating traditions such

as Banned Books Week and National Library Week—in Second Life and ALA leaders were meeting and speaking in Second Life. A series of videos created by American Libraries for National Library Week (2008) received over 78,000 views, with comments appearing on YouTube, Blip, AL Focus and other sites. In 2007, the ALA Council authorized formation of a special ad hoc Task Force on Electronic Member Participation, chaired by Janet Swan Hill, to explore ways of integrating “virtual” participation into the organizational fabric of ALA. The special committee is due to report in January, 2009.

ALA CONFERENCES, SERVICES, AND OPERATIONS

To support its mission and its members, the ALA provides core services and products generally common to all associations, including publishing, conferences, standards and guidelines, research and statistics, and awards and scholarships. These and other functions are managed through a headquarters operation.

ALA Publishing

Professional literature on librarianship was minimal prior to the mid-nineteenth century. In 1886, the ALA formed the publishing section for publication of catalogs, indexes, and other bibliographical tools not easily produced by individual libraries.^[2] Early ALA publications were printed and distributed by other organizations, including Melvil Dewey's own Library Bureau, Houghton Mifflin and the U.S. Government Printing Office.^[48] In 1900, a Publishing Board was created, replaced by an Editorial Committee in 1921, and reestablished in 1966, retaining the Editorial Committee in an advisory capacity. As the Association grew, both the editorial and technical work of publishing became increasingly the work of staff. The Association's publication program is now guided by the ALA Publishing Committee, a standing committee of Council.

ALA's present publishing business began in 1886 with starting capital of \$486. In 1902, Andrew Carnegie provided increased impetus with the gift of a \$100,000 endowment for “the preparation and publication of reading lists, indexes, and bibliographical aids.”^[2] The program made available to libraries small publications that might not have been economically feasible without such support. That endowment, now the Carnegie–Whitney endowment, still supports such lists. By 1922, ALA Publishing sales had reached almost \$24,000. By 1966, ALA's publishing department had sales in excess of \$990,000. By 2000, ALA Publishing had published over 1520 titles—not including titles published through individual divisions of the Association.

In 1904, at the conference in Atlantic City, discussion began which would lead to the establishment of *ALA Bulletin* in 1907, competing with both *Library Journal* and *Public Libraries*, begun by Dewey in 1896. While the new *ALA Bulletin* was given the “Proceedings” of the Association to publish, it was not designated ALA’s “official organ.” That designation was retained by *Library Journal* until 1908, when the *ALA Bulletin* was so-designated.^[14] The *ALA Bulletin* was published through December 1969—a total of 63 volumes. In January 1970 volume one of a new journal—*American Libraries*—appeared and continues today as ALA’s official organ, with a standing advisory committee. *American Libraries* committed to four-color coverage in January 1980 for its report on the White House Conference.^[49] *American Libraries* has continued to change with the Association, expanding to include *AL Direct*, a weekly online newsletter, in 2006 and opening *AL Focus*, a video and discussion site, in 2007.

In 1905, the Carnegie endowment made possible the establishment of *The Booklist*—a book review journal. The number of subscriptions rapidly grew to 3000, with state library commissions purchasing multiple copies.^[14] Originally published eight times a year, *Booklist* is now published 22 times a year and has a print subscription of over 20,000. *Booklist* reviews are licensed by numerous electronic publishers, in both CD and online formats. In 1994, *Booklist* spawned a companion journal, *Book Links*, which has over 18,000 subscribers, as of August 2001. *Book Links* is focused on connecting books, libraries, and classrooms. In 2006, 100 years after its initial establishment, *Booklist* opened a new era with the release of *Booklist Online*.

As of August 2008, ALA Publishing’s journals include *American Libraries*, *Booklist*, *Booklist Online*, *Book Links*, and *ALA TechSource*. ALA Editions publishes approximately 30 new or revised titles a year, with a backlist of over 300 titles. The *Guide to Reference*, long a staple—under a variety of titles—of the ALA Editions catalog, released as an online title in 2008 (Appendix).

ALA Graphics provides posters and other promotional items supporting libraries, literacy, and reading. ALA Graphics has also played a key role in ALA’s advocacy for libraries. In 1921, ALA commissioned Chicago Tribune cartoonist John T. McCutcheon (the 1932 Pulitzer Prize winner) to draw a poster advocating use of libraries. Copies of the poster were made available to libraries—at \$5.00/100 posters, \$3.50/1000 bookmarks.^[50]

In 1981, ALA inaugurated its celebrity “Read” posters—now a staple offering in the ALA Graphic catalog. The first “star” to be featured was not a person but a cartoon—Mickey Mouse. ALA produced its first set of celebrity “Read” posters in 1984–1985. Posters featured such stars as Bette Midler, Paul Newman, Mikhail Baryshnikov, and Michael J. Fox. Of that first set, the most popular would be a poster of “Bill Cosby and

friends”—with over 26,000 copies sold by the end of the decade.^[51] Current posters feature Tony Hawk, Rachel Ray, Corbini Bleu and Common, among others. In addition to the celebrity “Read” posters, ALA Graphics also markets a “Read” CD, enabling libraries across the country to produce their own posters—featuring staff and local celebrities.

ALA Conferences

Annual conference: Growth and development

The first ALA conference was held in 1876. With the exception of 1878, 1880, and 1884, the Association then held annual conferences until the war years of 1943–1945. Six of these meetings were international conferences, held in European cities in conjunction with European associations. Four conferences were held in Canada—but were not considered “international.”^[2] The fifth Canadian conference, in Montreal in 1960, was a joint ALA–Canadian Library Association conference. In June 2003, the American and Canadian Library Associations once again held a joint conference in Toronto. With registration underway—and on track for a record attendance—an outbreak of SARS (Severe Acute Respiratory Syndrome) was reported in Toronto. Both ALA and CLA staff and leaders would spend the countless hours over the next months in consultation with public health agencies, medical practitioners, and others—and, in the end, the ALA, along with CLA, would be the first major convention and exhibit to keep its commitment to meet in Toronto following the SARS outbreak.

In 1903 (Boston), conference attendance surpassed 500 for the first time—setting a new record at 1018 at a time when total ALA membership was 1152. By 1938 (New York), attendance had reached the 5000 mark. Over 12,000 gathered to celebrate ALA’s Centennial in 1976. In 1990, *American Libraries* reported: “Back in January, portents of a possibly impossibly large Annual Conference were evident.”^[52] With ALA membership at the 50,000 mark, famous speakers scheduled (including Tom Wolfe, Ray Bradbury and Senators Paul Simon and Patrick Leahy), ALA celebrating its 100th anniversary, attendance totaled 19,982—surpassing the previous year’s attendance in San Francisco by 2776. Total attendance 10 years later, at the 2000 Annual Conference in Chicago, was 24,913. In June 2007, ALA set a new Annual Conference participation record, in Washington, DC, at 28,499, including registrants, exhibitors, staff, press, and guests.

Throughout ALA’s history, conferences have served the purposes of governance, education, business, and entertainment. In 1891, following ALA’s first conference in San Francisco, ALA president Samuel S. Green, elected to replace an ailing Dewey, suggested that future conferences be held in locations with fewer non-conference enticements.^[14] That meeting was attended primarily by westerners, with only 40 ALA members making the then-lengthy trek from the east coast.

Member complaints about meeting conflicts at conferences are also almost as old as the Association. In 1889, the newly formed College and Reference Section held its first meeting apart from the general body of conference attendees. Within a few years, members were complaining about missing meetings because of conflicts. Growth in membership and growth in demand for establishment of separate units within the Association to address special needs led to a continuing escalation in the number of meetings during the annual conference—as well as to increasing numbers of pre- and post-conference meetings. By 1967 (San Francisco), there were 987 meetings at the annual conference. By 2000 (Chicago), there were approximately 2500 meetings, programs, and events. That number has remained fairly stable.

Exhibits also began early. The Chicago conference of 1893, in conjunction with the World's Fair, included a model library, architectural exhibits, the Leyden Books, and the Rudolph continuous indexer.^[14] By the 1967 San Francisco conference, there were 375 commercial exhibits. By the 2001 San Francisco conference there were 1600 booths.

The Midwinter Meeting

In 1908, ALA began holding an annual business meeting—the Midwinter Meeting—in Chicago. Over the next four decades, that meeting expanded steadily in number of registrants and types of meetings. Beginning in 1952, the Midwinter Meeting was limited to the meetings of the ALA Council, the Executive Board and the business meetings of all ALA units, thus beginning a continuing cycle of expansion and restriction. In 1958, Council acted to further restrict the Midwinter Meeting, eliminating “programs, general business, or Membership Meetings of the divisions, sections, or round tables.” Following that restriction, the Midwinter Meeting again began to broaden.

In response to member pressures, in the Spring 1965, a committee of the Executive Board and Council, chaired by Katherine Laich, was appointed to study and make recommendations regarding the Midwinter Meeting. The committee's recommendations, at the 1966 Midwinter Meeting, were adopted without discussion. While the Midwinter Meeting would continue to be primarily “for carrying out the business of the Association through meetings of the Council, boards, and committees,” and while there would continue to be “be no programs, general business, or Membership Meetings of the divisions, sections, or round tables,” the Executive Board now had the power to authorize “a limited number of program meetings, institutes, conferences, or workshops. . . .”^[53]

The report also allowed the ALA Executive Board to “authorize the occasional movement of the Midwinter Meeting to an appropriate center other than Chicago. . .” and authorized ALA staff “to experiment with a limited number of commercial exhibits at the Midwinter Meeting,

whether in Chicago or elsewhere.” By March 1987, a headline in *American Libraries* declared: “A burgeoning ALA gobbles up 3800 hr of meetings in six days as it programs for information access and a library-card campaign.”^[54] That Midwinter Meeting in Chicago drew 6337 registrants (a 12% increase over the previous year) and a “house full of exhibitors.” In 2001, 13,989 gathered for the 2001 Midwinter Meeting in Washington, DC, including 10,249 registrants and exhibits visitors, as well as 3819 exhibitors, plus staff, press, and guests.

The educational function of the Midwinter Meeting has continued to grow, both based on and encouraging strong regional attendance. Early in the twenty-first century, ALA Divisions and other groups began offering “Pre-Midwinter Institutes” in conjunction with the ALA Midwinter Meeting. The number of such institutes grew over the next several years. The Midwinter Meeting has been particularly characterized by a rich, and growing, array of discussion groups, interest groups, and other “communities of interest.” Approximately, 200 such groups currently convene. In 2007 (Seattle), the ALA Executive Board authorized a speaker series—currently called the “Sunrise Speaker Series”—designed to give first-time and regional attendees a “taste” of the Annual Conference.

Conferences: Change and controversy

ALA's strong support for key values has, at times, affected conference site selection.

The ALA Annual Conference was held in Richmond, Virginia, in 1936. African-American members of the Association were faced with segregated lodging and eating facilities. Faced with protests from members, the ALA Council, on a recommendation from the new Committee on Racial Discrimination in 1937, adopted a policy that ALA would not meet in cities where access to conference hotel and meeting rooms was not available on equal terms. It would be another 20 years before the Association would meet in the South again. In 1977, the ALA, having gone on record in support of the Equal Rights Amendment in 1974, joined a “conference boycott” of states that had not approved the ERA. It would be 7 years before an ALA Annual Conference or Midwinter Meeting returned to Chicago when the 104th Annual Conference would set a new record with 10,152 paid attendees, breaking the 1980 record set in New York (9479). Issues related to gay rights would later result in the shifting a Midwinter site from Cincinnati to Philadelphia, as well as a Council resolution calling on the Association not to complete conference site contracts with jurisdictions that discriminate by law, with the ALA Executive Board to determine the appropriate action in each case, based on information to be provided by ALA Conference Services.^[55]

If ALA's strong values have sometimes led the Association to boycott sites, values have also been a key factor in staying with sites under difficult circumstances. Late in

the 2005 hurricane season, Katrina devastated New Orleans, scheduled site of the June 2006 ALA Annual Conference. That fall, following a brief visit to the city by key ALA staff, and extensive consultation, the ALA Executive Board agreed with a management recommendation that the 2006 ALA Annual Conference would proceed in New Orleans. Again, as in Toronto, ALA would be the first major conference and exhibition to make that commitment. In June, in addition to gathering for a conference, almost 1000 ALA members fanned out to volunteer sites across the city to assist in recovery efforts.

ALA's demographic profile and commitment to participation was reflected in a 1985 recommendation by the Committee on the Status of Women in Librarianship, endorsed by the ALA Executive Board, to ask Annual Conference Local Arrangements to provide a list of recommended child care services in host cities. Today, "Camp ALA" is a regular part of each ALA Annual Conference.^[56]

Reflecting rising national awareness of physical fitness, in 1984, at the Annual Conference in Dallas, ALA held its first Annual Conference Fun Run. 1st ALA Fun Run. Runners completed a 3 mi course in approximately 16.35.^[49] The ALA Fun Run ended following the 2004 Annual Conference, falling victim to rising costs and competition for scarce resources. Health concerns made a return to the ALA Annual Conference, however, in 2008, with ALA President Lorie Roy's Wellness Fair.

Awards and Scholarships

ALA grants and awards are presented for distinguished service to the profession, for publication and for research. Grants and awards, including some of the best known awards (such as the Caldecott and Newbery Medals), are given by ALA and by its Divisions and Round Tables. The ALA Awards Committee coordinates the work of the ALA awards juries and provides a broad policy and procedural framework within which the awards committees of various ALA units function. "Awards" initially encompassed all types of awards, including scholarships. In 2005, with the growth in the number of awards and scholarships, the ALA Scholarships and Study Grants committee was established, dividing the responsibility with the ALA Awards Committee.

"Check off" contributions to ALA scholarship endowments, through the annual ALA membership renewal process, began in 1976, with contributions going either to the David H. Clift scholarship or the Minority Scholarship. In 1977, the latter was renamed the Louise Giles scholarship in honor of a past president of Association of College and Research Libraries (ACRL). Over the next 3 decades, scholarship programs would increasingly—though not exclusively—focus on increasing diversity. The first Louise Giles Minority Scholarship was awarded by ALA in 1977. By 1991, the Library and Information

Technology Association, a division of ALA, began offering a minority scholarship (LITA/OCLC, LITA/LSSI). In 2000, the ASCLA Century Scholarship was established, to recruit people with disabilities to the profession.

In 1997, the ALA Executive Board approved the Spectrum Initiative, a 3-year, \$1.35 million, recruitment and scholarship initiative providing 50 \$5,000 scholarships/year to students from four traditionally under-represented racial/ethnic groups, as well as an ongoing Spectrum Institute (valued at \$1500/scholar), designed to build connections and community, and to facilitate the transition to professional leadership.^[57] The Spectrum Initiative subsequently developed into the "Spectrum family" of scholarships, including, as of 2008 the Giles, Albert, Teeple, Gordon, and Turock Scholarships, as well as the Spectrum scholarships, [Scholarship] Bash Scholarships, and a scholarship from the Medical Library Association. By 2008, the total number of Spectrum Scholars, past and current, had reached 560. Growth in the Spectrum program was significantly aided by the receipt of two awards (2004, 2007) from the federal Institute of Museum and Library Services (IMLS), under the Laura Bush 21st Century Librarian program. In 2006, IMLS awarded a grant to the University of Pittsburgh, working with ALA, for a Spectrum Doctoral Fellowship. The first Spectrum Doctoral Fellowships were awarded through ALA in 2006.

Standards and Guidelines

Over the course of its history, ALA has promulgated standards and guidelines for college, school, state, public, hospital, and institutional libraries. ALA is not a regulatory body and these standards have been promulgated for use by autonomous institutions. Standards have, nevertheless, been seen as valuable in providing a guide for self-measurement. Libraries have used ALA standards in seeking increased support, improved legislation. Standards and guidelines are reviewed by ALA's Standards Committee for consistency with ALA policy. A current list of standards and guidelines is available on the ALA Web site.

ALA Offices

ALA's programmatically focused Offices largely mirror the member-determined priority areas of the Association. As of August 31, 2008, ALA Offices included the following:

Chapter Relations Office, Development Office, Diversity Office, International Relations Office, Office for Accreditation, Office for Government Relations (in Washington, DC), Office for Human Resource Development and Recruitment, Office for Information Technology Policy (in Washington, DC), Office for Intellectual Freedom, Office for Library Advocacy, Office for Literacy and Outreach Services, Office for Research and Statistics, Office for ALA Governance, Public Information Office, Public Programs Office, Washington Office (in Washington,

DC). ALA maintains a headquarters Library and Knowledge Management Center—serving members and staff, as well as the public. Most offices work with standing advisory committees of members.

Headquarters offices

For the first 30 years of its life, ALA conducted all its activities, except publishing, without a permanent headquarters office and, generally, without paid staff. In 1906, ALA leased office space on Newbury Street in Boston—a lease that would be terminated by the end of 1907. By 1909, following a protracted debate over location, ALA took a small step toward establishment of a permanent headquarters, using space provided by The Chicago Public Library in its Central Library.^[2]

By 1924, the Association was outgrowing its quarters at the Chicago Public Library and part of the headquarters staff moved across the street to quarters provided by the John Crerar Library.^[2] Then, in May 1929, the entire ALA staff, 50 people, moved into rented quarters at 520 North Michigan Avenue, Chicago. In July 1946, the Association moved into the former Cyrus H. McCormick mansion at 50 East Huron, which the Association had purchased and remodeled. Despite debate—but with addition—ALA continues at that site.

With headquarters established in Chicago, in 1944 ALA Council approved a Library Development Fund drive, to raise money from ALA membership for the temporary support of an ALA Washington Office.^[58] In 1946, ALA opened its federal office in Washington, DC; the first director was Paul Howard. The fund would continue to support the Washington Office until 1949, when closure was threatened due to the Fund depletion. An alternative funding proposal—including both ALA operating and endowment funds, as well as contributions from state library associations and individuals—was proposed by Ralph Lindquist, then chair of ALA's Federal Relations Committee, and ALA's Washington Office continued.

Soon after the Chicago headquarters moved into the McCormick mansion, in 1949, the Fourth Activities Committee recommended that all ALA headquarters activity be in Washington, DC. (ALA already housed government-relations staff there.) While this recommendation was rejected at the time, the issue of headquarters location remained a significant one to many association leaders. In 1957, the Executive Board Subcommittee on Headquarters Location recommended the sale of the Chicago property and relocation of its headquarters to Washington, DC, by the beginning of 1959, citing greater convenience to the majority of members and officers, proximity to other national associations with which ALA maintained working relationships, the economy and administrative efficiency of combining the Chicago and Washington operations, and legal matters. While the ALA Council approved the recommendation (82–34), the ALA

membership exercised its right to set aside Council action, petitioned for a mail vote by the membership, and reversed the Council decision (5739–2199).

In 1963, during the Annual Conference in Chicago, ALA dedicated its own building, at 50 E. Huron Street in Chicago, erected on the site of the old McCormick mansion. The staff then numbered 164. ALA had, however, entered a period of rapid programmatic growth. A short 2 years later, headquarters space was again a problem, the publishing department was moved to rented space, and the new headquarters building was remodeled (1966). It was obvious that additional space would be required, which again brought up the question of moving to Washington, DC. Again, in 1967, a subcommittee of the Executive Board recommended that the ALA headquarters be moved to Washington, DC. Again, Council supported the Board's recommendation and, again, membership petitioned for a mail vote and overturned the Council action.

Following lengthy debate and some lean years, in 1974 ALA President Jean Lowrie signed the agreement which would lead to ALA's new headquarters building, adjoining the 50 E. Huron facility. In November 1977, ALA entered into a complex development agreement that would exchange approximately 26,000 ft² of undeveloped property owned by ALA—and used by ALA staff for parking—for six floors of office space, lobby, and related facilities.^[59]

In addition to the Chicago headquarters, ALA also owns and maintains offices in Washington, DC for staff involved in government relations, as well as the Office for Information Technology Policy. The staff of *CHOICE* magazine, a publication of the ACRL, a division of ALA, is located in a Middletown, CT office. In 2008, ALA began the process of purchasing office space for *CHOICE*.

CONCLUSION

Reporting at the end of FY2007, ALA Treasurer Rod Hersberger presented a complex, but healthy, organization, with total FY2007 revenues over \$50 million and a consolidated balance sheet showing net assets in excess of \$36 million. As of the end of fiscal year 2008, the total staff of the ALA had grown to about 280.^[60] Various reports on the state of the association would present a strong organization facing significant challenges—from rapidly changing technology to a faltering economy, from challenges to privacy and intellectual freedom to the complexities of copyright in a networked global society.

Looking back over ALA's history, however, provides grounds for optimism. From the late nineteenth century to the early twenty-first century, you see an organization that has held steadfastly to its core mission “to promote library service and librarianship.”^[1] To enable that essential continuity, it has been willing to periodically review and change its structure, develop and modify policies to

address an increasingly diverse and globalized society and take advantage of a succession of new technologies. Current programmatic priorities—advocacy, diversity, education and lifelong learning, equitable access to information, intellectual freedom, literacy—run like bright threads through the long and complex history, knitting together the organization, policy, and public stance. That persistence of mission and message is essential and it provides a foundation for organizational change.

APPENDIX

American Library Association: Membership Statistics, August 2008^a

American Library Association	66,624
<i>ALA Divisions</i>

American Medical Informatics Association (AMIA)

Don E. Detmer

Tia Abner

Karen Greenwood

American Medical Informatics Association (AMIA), Bethesda, Maryland, U.S.A.

Abstract

The American Medical Informatics Association (AMIA) incorporated 20 years ago through the merger of three existing informatics groups: the Symposium on Computer Applications in Medical Care (SCAMC), the American Association for Medical Systems and Informatics (AAMSI), and the American College of Medical Informatics (ACMI). AMIA has nearly 4000 members from over 55 countries worldwide, including informatics professionals, students, institutions, and corporations. Together they represent all basic, applied, and clinical interests in informatics. AMIA is the trusted source of knowledge about the effective use of informatics to transform health care within three domains: clinical informatics (including health care, research, and personal health management), public health and population informatics, and translational bioinformatics. AMIA holds several meetings each year—the Summit on Translational Bioinformatics in March, the Spring Congress in May, an Academic Forum meeting in the summer, and two fall meetings, the Health Policy Meeting in September and its signature event, the Annual Symposium held in November.

AMIA—THE PROFESSIONAL HOME FOR BIOMEDICAL AND HEALTH INFORMATICS

American Medical Informatics Association (AMIA) is the premier professional organization in the United States dedicated to the development and application of informatics in the support of health and patient care, public health, teaching, research, administration, and related policy. AMIA incorporated 20 years ago as the American Medical Informatics Association through the merger of three existing informatics groups, the Symposium on Computer Applications in Medical Care (SCAMC), the American Association for Medical Systems and Informatics (AAMSI), and the American College of Medical Informatics (ACMI). AMIA has nearly 4000 members from over 55 countries worldwide. Members include informatics professionals, students, institutions, and corporations and together, they represent all basic, applied, and clinical interests in informatics. AMIA is governed by a Chairman and Board of Directors and calls upon its members to serve in volunteer roles on task forces, committees, and working groups. AMIA office is led by the President and CEO who works with a professional staff to manage AMIA's programs and services.

AMIA is the trusted source of knowledge about the effective use of informatics to transform health care within three domains: clinical informatics (including health care, research, and personal health management), public health and population informatics, and translational bioinformatics. AMIA is frequently called upon as a source of informed and scholarly opinion on policy issues relating

to the national health information infrastructure, uses and protection of personal health information, and public health considerations and international dimensions of informatics education and research. AMIA publishes a leading industry cited scholarly journal, *the Journal of the American Medical Informatics Association (JAMIA)*, proceedings of its meetings, the e-News Weekly, an electronic newsletter, and digest of syndicated news as well as AMIA's Standards Standard bulletin, a periodic review of international health-related standards.

In 2005, the Board of Directors, members and AMIA staff undertook a strategic planning exercise to review and where needed redefine the vision, mission, and goals of the association. Now, 4 years later, AMIA has cemented its standing in the health care community as the professional home for biomedical and health informatics. AMIA continues to work on new projects to advance health and health care with the development of educational offerings and programs, public policy and advocacy initiatives, scientific meetings and symposia, white papers and reports, and ongoing membership activities.

AMIA holds several meetings per year—the Summit on Translational Bioinformatics in March, the Spring Congress in May, an Academic Forum meeting in the summer, and two fall meetings, the Health Policy meeting and the Annual Symposium. Summit programming includes informatics research emerging from the analysis of molecular and clinical data and measurement; relating and representing phenotypes and disease; delineating disease through the study of organisms, evolution, and taxonomy; and computational approaches to finding molecular

mechanisms and therapies for disease. The congress program engages attendees to develop a common view of the opportunities and challenges facing informatics. Congress topics include the development of effective electronic health records and the evaluation of their impact on care delivery; the incremental definition of personal health records and the new challenges associated with emerging approaches to Personal Health Records (PHR) development and use; the technologies, policies, research, and social structures required to create a stronger public health informatics infrastructure; and the opportunities, challenges, and progress associated with accelerating the field of clinical research informatics.

AMIA's Annual Symposium is the premier scientific meeting for new research and development in biomedical and health informatics. It is the place to hear about leading edge scientific work, to learn about evolving standards and policies for the management of biomedical information, and to understand how cutting-edge information and communication technologies can best be developed and deployed. The symposium provides a wide range of formats for education and discussion and includes half-day tutorials, expert panels, papers, posters, and invited talks. Over 2000 biomedical and health informatics professionals attend this signature event each year. AMIA's education, training, and academic-related opportunities are rigorous and independently evaluated, and we continue to develop new programs and services. Our 10 × 10 program to train 10,000 health care professionals in applied health and medical informatics by the year 2010 continues to grow. In 2007, AMIA launched a 5-year cooperative agreement with the Centers for Disease Control and Prevention. The purpose of the program is to strengthen the breadth and depth of the public health workforce by providing a training in public health informatics and encourage new explorations of innovations at the intersection of public health and health informatics. AMIA also continues to support nursing informatics through the Alliance for

Nursing Informatics, the TIGER initiative, and our own educational endeavors. AMIA received the exciting news in 2007 that it was selected to host NI2012, the 11th triennial Congress on Nursing Informatics. This is the premier meeting for nurses and informatics experts representing global communities and working with informatics applications in nursing care, administration, research and education, and will bring together thought leaders of the nursing informatics community.

In 2008, AMIA launched the Academic Forum and it now has 45 members. The Forum provides a unique platform for surveying and analyzing activities in academic units dedicated to biomedical and health informatics, and for recommending best practices related to education, scholarship, faculty development, salary structures and retention, and other selected issues relating to the academic enterprise.

One of AMIA's newest agenda items is to develop through its membership in and collaboration with the International Medical Informatics Association (IMIA), an international distance learning continuing education program in informatics for low-resource environments. Working under a global umbrella program known as 20/20 e-Health Capacity Building, AMIA is creating *Health Informatics Building Blocks* to improve basic clinical informatics skills.

Also relating to the association's e-Health Capacity strategy, AMIA received a \$1.2 million grant from the Bill & Melinda Gates Partnership to support the development of a blueprint to create a robust global health informatics education and research infrastructure in low-resource settings. Through this Global Partnership Program (GPP), AMIA will lead a team of experts to develop scalable approaches to e-health education, and help address the need for a global informatics workforce and scholarly network.

More information about AMIA may be found on its Web site: <http://www.amia.org>.

American National Standards Institute (ANSI)

Jana Zabinski

American National Standards Institute, New York, New York, U.S.A.

Abstract

The American National Standards Institute (ANSI) is a private, nonprofit organization that oversees the standards and conformity assessment system in the United States.

INTRODUCTION

The American National Standards Institute (ANSI) is a private, nonprofit organization that oversees the standards and conformity assessment system in the United States, and represents the needs and views of U.S. stakeholders in standardization forums around the globe. ANSI's membership comprises government agencies, organizations, corporations, academic and international bodies, and individuals. The Institute represents the interests of more than 125,000 companies and 3.5 million professionals.

The American National Standards Institute approves standards that are developed by accredited organizations comprised of representatives of standards developing organizations (SDOs), government agencies, consumer groups, companies, and others. The Institute also accredits organizations that carry out product or personnel certification in accordance with requirements defined in international standards. (See Fig. 1.)

Standards ensure that the characteristics and performance of products are consistent, that the same definitions and terms are used, and that products are tested the same way. For example, standards ensure that libraries can share electronic card catalog information, and patrons can search those catalogs from connected computers with Internet access.

HISTORY

By the twentieth century, the need for coordination among U.S. standards-setting groups became evident. In October 1918, three government agencies and five private sector organizations joined together to form a coordination body known as the American Engineering Standards Committee, the predecessor of what is now known as ANSI.

Today, the U.S. standardization community is comprised largely of nongovernmental SDOs and consortia; these groups are primarily supported by industry participation.

OVERVIEW OF THE U.S. STANDARDIZATION SYSTEM

Standardization encompasses a broad range of considerations—from the actual development of a standard to its promulgation, acceptance, implementation, and demonstration of compliance. A primary facilitator of commerce, standardization has become the basis of a sound national economy and the key to global market access.

Voluntary consensus standards serve as the cornerstone of the distinctive U.S. standardization system. These documents arise from an open process that depends upon data gathering, a vigorous discussion of all viewpoints, and agreement among a diverse range of stakeholders. Thousands of individual experts representing the viewpoints of consumers, companies, industry and labor organizations, and government agencies at the federal, state, and local level voluntarily contribute their knowledge, talents, and efforts to standardization activities.

“Voluntary” refers only to the manner in which the standard was developed; it does not necessarily refer to whether compliance to a consensus standard is optional or whether a government entity or market sector has endorsed the document for mandatory use.

AMERICAN NATIONAL STANDARDS

The Institute oversees the creation, promulgation and use of thousands of norms and guidelines that directly impact businesses in nearly every sector: from manufacturing and construction to agriculture, food service, software engineering, energy distribution, and more. Likewise, ANSI-accredited standards developers span the full gamut of industry sectors and services.

Though ANSI itself does not develop standards, the Institute facilitates the development of American National Standards, also known as ANS, by accrediting the procedures of standards developing organizations. ANSI accreditation signifies that the procedures used by these bodies meet the Institute's essential requirements for openness,

Fig. 1 ANSI Logo.

balance, consensus, and due process. Currently, more than 200 active SDOs are accredited under the *ANSI Essential Requirements: Due process requirements for American National Standards*. Approximately 10,500 American National Standards carry the ANSI designation.

Hallmarks of the American National Standards process involve

- Consensus by a group that is open to representatives from all interested parties.
- Broad-based public review and comment on draft standards.
- Consideration of and response to comments.
- Incorporation of submitted changes that meet the same consensus requirements into a draft standard.
- Availability of an appeal by any participant alleging that these principles were not respected during the standards-development process.

For example, the National Information Standards Organization (NISO) develops and maintains standards for information systems, products, and services relating to bibliographic and library applications. NISO's standards span both traditional and new technologies, and address the full range of information-related needs, including retrieval, storage, and preservation.

Another ANSI-accredited standards developer, the Data Interchange Standards Association (DISA) writes standards that support e-commerce and business-to-business data exchange, from order processing to electronic payment. DISA also serves as the secretariat for the ANSI-Accredited Standards Committee (ASC) X12, which develops e-business exchange standards in XML and X12 EDI formats.

ANSI INVOLVEMENT IN INTERNATIONAL STANDARDS ACTIVITIES

In the international arena, ANSI promotes the use of U.S. standards abroad, advocates U.S. policy and technical positions in international and regional standards and conformity assessment organizations, and encourages the adoption of international standards as national standards where appropriate. The Institute is the official U.S. representative to the two major international standards organizations,

the International Organization for Standardization (ISO) and, via the U.S. National Committee (USNC), the International Electrotechnical Commission (IEC). ANSI is also a member of the International Accreditation Forum (IAF).

Through ANSI, the U.S. has immediate access to the ISO and IEC standards development processes. ANSI and the USNC frequently carry U.S. standards forward to ISO and IEC where they are adopted in whole or in part as international standards. U.S. positions are developed by U.S. Technical Advisory Groups (TAGs) that have been accredited by ANSI or approved by the USNC. Participation in a U.S. TAG is open to all affected stakeholders.

On behalf of ANSI, NISO administers the U.S. TAG to ISO Technical Committee 46 (TC 46), *Information and Documentation*. TC 46 develops international standards relating to records management and museum documentation, as well as publishing, archiving, and indexing.

ASC X12 serves as the U.S. TAG administrator to ISO TC 154, *Processes, Data Elements and Documents in Commerce, Industry and Administration*, which supports international standardization activities in the field of industrial data. ISO TC 154 standards address business administration processes and information interchange between individual organizations.

CONFORMITY ASSESSMENT

On the other side of the standardization coin is conformity assessment, a term used to describe the evaluation of products, processes, systems, services, or personnel to confirm adherence to the requirements identified in a specified standard. In general, conformity assessment includes sampling and testing, inspection, supplier's declaration of conformity, certification, and management system assessment and registration. It can also include accreditation of the competence of those activities by a third party and recognition (usually by a government agency) of an accreditation program's capability.

Conformity assessment forms a vital link between standards that define product characteristics or requirements and the products themselves. It can verify that a particular product meets a given level of quality or safety, and it can provide explicit or implicit information about the product's characteristics, the consistency of those characteristics, and/or the performance of the product.

The American National Standards Institute's role in the conformity assessment arena includes accreditation of organizations that certify that products and personnel meet recognized standards. The ANSI-American Society for Quality National Accreditation Board (ANAB) serves as the U.S. accreditation body for management systems certification, primarily in areas such as quality (ISO 9000 family of standards) and/or the environment (ISO 14000 family of standards). ANSI also is involved in several international and regional organizations to promote multilateral

recognition of conformity assessments across borders to preclude redundant and costly barriers to trade.

The American National Standards Institute's accreditation programs themselves are created in accordance with international guidelines as verified by government and peer review assessments.

STANDARDS PANELS

Through its standards panel program, ANSI provides standards-based solutions to national and international priorities. Each of the Institute's panels engages a broad range of stakeholders in the coordination and harmonization of standards and conformity assessment activities relevant to the panel's area of focus.

In 2004, the ANSI Homeland Security Standards Panel (ANSI-HSSP) supported a special project on private-sector emergency preparedness that had been requested by the 9/11 Commission. The panel continues to provide ongoing support for the Department of Homeland Security and other agencies.

At the request of the Office of Science and Technology Policy in the Executive Office of the President, ANSI launched the Nanotechnology Standards Panel (ANSI-NSP) to facilitate the development of standards for nanotechnology nomenclature and terminology; materials properties; and testing, measurement, and characterization procedures.

The Healthcare Information Technology Standards Panel (HITSP) is under contract with the Department of

Health and Human Services to assist in establishing a national health IT network for the United States.

The Identity Theft Prevention and Identity Management Standards Panel (IDSP) is supporting all citizens in its efforts to facilitate the identification and development of standards to secure and protect personal information.

Launched in May 2007, the ANSI Biofuels Standards Panel (ANSI-BSP) is a cross-sector coordinating body established to promote the development and compatibility of standards and conformity assessment programs to support the large-scale commoditization of biofuels.

CONCLUSION

The American National Standards Institute provides the forum through which all affected stakeholders may cooperate in establishing, improving, and recognizing consensus-based standards and certification programs that are dynamically responsive to national needs. ANSI continues to be fully involved in its support of the goals of U.S. and global standardization and remains committed to enhancing of the quality of life for all global citizens.

American Society for Information Science and Technology (ASIST)

Charles H. Davis

Debora Shaw

School of Library and Information Science, Indiana University, Bloomington, Indiana, U.S.A.

Abstract

The American Society for Information Science and Technology (ASIST) was founded as the American Documentation Institute in 1937. In response to the evolution of the field, the society has grown and changed its structure and focus. This entry describes the Society's history, purpose, structure (regional chapters plus topical special interest groups), governance, meetings, and publications. This entry is based on the History of ASIST section of the Society's Web site, <http://www.asis.org>.

INTRODUCTION

The American Society for Information Science and Technology, ASIST, is an association of researchers and information professionals leading the search for new and better theories, techniques, and technologies to improve access to information. Among its membership are some 4000 specialists from such fields as computer science, linguistics, management, psychology, librarianship, engineering, law, medicine, chemistry, and education; individuals who share a common interest in improving the ways society stores, retrieves, analyzes, manages, archives, and disseminates information, coming together for mutual benefit.

American Society for Information Science and Technology provides educational and conference programs, highly regarded journals, and other publications, as well as professional services for information systems developers, online professionals, information resource managers, librarians, record managers, and others who bridge the gaps between research and application, and between developer and user. The Society's flagship publications are the highly regarded *Journal of the American Society for Information Science and Technology* and *Annual Review of Information Science and Technology*. The American Society for Information Science and Technology is a nonprofit 501(c)3 professional association organized for scientific, literary, and educational purposes.

HISTORY

1937—Beginnings in Documentation

The American Society for Information Science and Technology was founded on March 13, 1937, as the American

Documentation Institute (ADI), a service organization made up of individuals nominated by and representing affiliated scientific and professional societies, foundations, and government agencies. Its initial interest was in the development of microfilm as an aid to learning. Watson Davis, the Institute's first president (1946–1943), was the editor of *Science News Letter* and director of Science Service, a nonprofit organization founded to promote public appreciation of science. The American Documentation Institute compiled an impressive record of achievement in its early years: development of microfilm readers, cameras, and services; fostering negotiations and research that resulted in the so-called “gentleman's agreement” covering the photo-duplication of copyrighted materials; establishment of programs for the storage and reproduction of auxiliary publications in support of journal editors; operation of an Asian scientific literature service during World War II; support of Interlingua, an early rival of Esperanto, to foster international science communications; and cosponsorship of the 1958 International Conference on Scientific Information.^[1–4]

1950s—Transition to Modern Information Science

As the number of people engaged in developing new principles and techniques in the many areas of documentation and information services increased, the Bylaws were amended in 1952 to admit individual as well as institutional members. Thus, ADI became the national professional society for those concerned with all elements and problems of information science. With the 1950s came increasing awareness of the potential of automatic devices for literature searching and information storage and retrieval. As these concepts grew in magnitude and potential, so did the variety of professional interests.^[1,4,5]

1960s—The Information Explosion

During the 1960s, membership increased sevenfold as the problems created by the “information explosion” became of national concern. Reflecting this change in its total range of activities, as well as the emergence of information science as an identifiable configuration of disciplines, the membership voted to change the name of the ADI to the American Society for Information Science (ASIS). The name change took effect January 1, 1968, and emphasized the fact that the membership of ASIS was uniquely concerned with all aspects of the information transfer process, and that the Society was a national professional organization with regional chapters for those concerned with designing, managing, and using information systems and technology. Harold Borko’s frequently cited article, “What Is Information Science?,” helped to define the field:

Information science is that discipline that investigates the properties and behavior of information, the forces governing the flow of information, and the means of processing information for optimum accessibility and usability. It is concerned with the body of knowledge relating to the origin, collection, organization, storage, retrieval, interpretation, transmission, and utilization of information.^[6]

One of the Society’s flagship publications, the *Annual Review of Information Science and Technology (ARIST)*, was launched in 1966, under the editorship of Carlos A. Cuadra and with support from the National Science Foundation.

1970s—The Move to Online Information

The transitions from batch processing to interactive interaction and from mainframe to mini- and micro-computers accelerated in the 1970s. Traditional boundaries among disciplines began to fade; many library schools and some departments of computer science added “information” to their titles. In 1974, the Society’s *Newsletter* became the *Bulletin of the American Society for Information Science*, a mainstay membership publication of the Society. During this decade, ASIS made the midyear meeting an annual event focusing on a single topic of current interest and sponsored a bicentennial conference (1976) on the role of information in the country’s development. From 1970 to 1974, ASIS administered the Educational Resources Information Center (ERIC) Clearinghouse on Library and Information Sciences; the Society was also an active participant in the planning and implementation of the 1979 White House Conference on Library and Information Services.

1980s—Personal Computers Change the Market

By the 1980s, large databases such as Grateful Med at the National Library of Medicine and user-oriented services

such as Dialog and CompuServe, were for the first time accessible by individuals from their personal computers. The American Society for Information Science added to and revised its special interest groups (SIGs) to respond to the changes establishing groups on office information systems and personal computers as well as international information issues and rural information services. By the end of the decade, SIGs had been formed and reformed to represent various interests, including nonprint media, social sciences, energy and the environment, and community information systems, and ASIS had its first non-North American chapters.

1990s and 2000s—The Human/Social Perspective

The social implications of information and communication technologies became increasingly apparent in the 1990s and the Society responded. Ann Prentice’s “environmental scan” identified key topics that were expected to reshape work and the workforce, including public access to and ownership of information, internationalization, and increasing expectations of information technology. Themes that appeared regularly in the Society’s *Bulletin* and at national meetings included information management, globalization, intellectual property, computer networks (National Research and Education Network, the Internet), and digitization of text and visual information. Interest in representation of information found new applications in, for example, markup languages, taxonomy, metadata, and information architecture. Understanding of information retrieval was broadened and deepened by such developments as hypertext, the World Wide Web, search engines and browsers, and the addition of new domains to the Text Retrieval Conferences.

The Society experienced changes in its own use of information technology. Merri Beth Lavagninio introduced the ASIS-L listserv in 1992. The Society created its first Web site in 1995;^[7] it was chosen as a Yahoo! “Pick of the Day” in 1996. After considerable deliberation about making the Society’s publications available electronically, a digital library was unveiled in 2006. In 2007, the *Bulletin of the American Society for Information Science and Technology* became an electronic-only publication.

The Society’s work reflected the increasing interest in social and historical aspects of information science in other ways as well. In 1991, it renamed and reoriented one of the SIGs to focus on the History and Foundations of Information Science, and in 1992, ASIS adopted its first professional guidelines. Conferences cosponsored with the Chemical Heritage Foundation on the History and Heritage of Scientific and Technical Information Systems were held in 1998 and 2002.

Reflecting both internal and external influences, the Society again changed its name in 2000, becoming the American Society for Information Science and Technology. President Eugene Garfield championed the change,

calling attention to the importance of practical, information-technology focused programs. The Society continued its annual meetings, but discontinued the midyear meeting in favor of “summits” featuring topics such as information architecture, knowledge management, and digital archives for engineering and scientific research.

PURPOSE

ASIST’s mission is to advance the information sciences and related applications of information technology by providing focus, opportunity, and support to information professionals and organizations.

The Society seeks to stimulate participation and interaction among its members by affording them an environment for substantive professional exchange. It encourages and supports personal and professional growth through opportunities for members to extend their knowledge and skills, develop and use professional networks, pursue career development goals, and assume leadership roles in the Society and in the broader information community. The American Society for Information Science and Technology increases the influence of information professionals among decision makers by focusing attention on the importance of information as a vital resource in a high technology age; in this way the organization seeks to promote informed policy on national and international information issues. It supports the advancement of the state-of-the-art and practice by taking a leadership position in the advocacy of research and development in basic and applied information science.

To accomplish these goals, ASIST edits, publishes, and disseminates publications concerning research and development; convenes annual meetings providing a forum for papers, discussions, and major policy statements; holds smaller local and special interest meetings, as well as special symposia; and acts as a sounding board for the promotion of research and development and for the education of information professionals.

CHAPTERS AND SIGS

To give scope and focus to the diverse interests of its members, special interest groups (SIGs) were established in 1966. These groups are, in effect, small professional organizations within ASIST that encourage the discussion and development of both theoretical and practical issues. The introduction and widespread adoption of the World Wide Web encouraged and supported five virtual SIGs: Bioinformatics; Blogs, Wikis, and Podcasts; Critical Issues; Information Architecture; and Metrics. As of 2009, the other 17 SIGs are Arts and Humanities; Classification Research; Digital Libraries; Education for Information Science; History and Foundations of Information

Science; Human–Computer Interaction; Information Architecture; Information Needs, Seeking and Use; Information Policy; International Information Issues; Knowledge Management; Library Technologies; Management; Medical Informatics; Scientific and Technical Information Science; Social Informatics; and Visualization, Images, and Sound.

All ASIST members are automatically enrolled as members of SIG/CON, which seeks to “explore the fundamental notions of information science, and expose them for what they are.”^[8] The official SIG/CON Web site describes the initial meeting: “Those who stumbled into the first SIG/CON session found it to be one of the most informative and intellectually challenging sessions of the conference, a tradition which continues to this day.”^[8] Dr. Llewellyn C. Puppybreath III, founder and perpetual chair of the group, has yet to appear at any of its meetings. The breadth of topics covered is evident in this list of titles from presentations: “Baloonean Logic” by Ev Brenner, “Conical Classifications” by C. David Batty, “Titular Colonicity” by Candy Schwartz, and “Early Binary Separation: Implications for Information Retrieval (relevance judgments by identical twins separated at birth)” by Joseph Janes.

At a local and regional level, ASIST has, in 2009, 18 chapters in major cities and regions in the United States and around the world: Arizona, Carolinas, Central Ohio, Europe, Florida, Indiana, Los Angeles, Metropolitan New York, Michigan, Minnesota, New England, New Jersey, Northern Ohio, Pacific Northwest, Potomac Valley (Washington, D.C. area), Southern Ohio, Taipei, and Wisconsin. These chapters provide local forums for discussion and information exchange for members in a given locality.

In addition, 39 student chapters encourage the discussion and are in development of research and education, and are a medium for channeling student interest toward issues of concern to the profession: Catholic University of America, Drexel University, European Student Chapter, Florida State University, Indiana University, Long Island University, Louisiana State University, North Carolina Central University, Ohio Virtual, Pratt Institute, Rutgers University, San Francisco Bay Area, Simmons College, St. John’s University, State University of New York-Albany, State University of New York-Buffalo, State University of New York-Oswego, Taipei University, University of British Columbia, University of California at Los Angeles, University of Denver, University of Hawaii, University of Illinois at Urbana-Champaign, University of Iowa, University of Kentucky, University of Maryland, University of Michigan, University of North Carolina Chapel Hill, University of North Texas, University of Pittsburgh, University of South Carolina, University of South Florida, University of Tennessee, University of Texas-Austin, University of Toronto, University of Washington, University of Wisconsin-Madison, University of Wisconsin-Milwaukee, and Wayne State University.

GOVERNANCE

The ASIST Board of Directors consists of the president, president-elect, immediate past president, treasurer, a parliamentarian, directors chosen by the SIGs and chapters, and six directors-at-large. The American Society for Information Science and Technology maintains headquarters under an executive director at 1320 Fenwick Lane, Suite 510, Silver Spring, Maryland 20910. The Society's Web address is <http://www.asis.org>.

The Executive and Budget and Finance committees are standing committees of the Board of Directors; standing committees of the Society are Awards and Honors, Constitution and Bylaws, Information Science Education, International Relations, Leadership, Membership, Nominations, Publications, and Standards. An annual business meeting of the membership is held during the ASIST annual meeting.

The presidents of the Society have been:

PUBLICATIONS

Publication affords a major channel of communicating current significant research reports, development work, and professional activities, both to the membership and to the interested public. It also serves as an historical record of achievement. In addition to a substantial monograph series, ASIST produces four continuing publications.

The *Journal of the American Society for Information Science and Technology* is a highly ranked and frequently cited source for reports of research and development in information science. The *Journal of Documentary Reproduction* (edited by Vernon D. Tate and published by the American Library Association, 1938–1942) is considered the predecessor of the Society's journal. In 1950, it was reborn as *American Documentation*. With the Society's changes of name it became the *Journal of the American Society for Information Science* (in 1970) and subsequently the *Journal of the American Society for Information Science and Technology* (in 2001). The *Journal* serves as a forum for new research in information transfer and communication processes in general, and in the context of recorded knowledge in particular. Concerns include the generation, recording, distribution, storage,

representation, retrieval, and dissemination of information, as well as its social impact and management of information agencies. The *Journal of the American Society for Information Science and Technology* consistently ranks at or near the top in assessments of influence in the field. It has gradually increased from four issues per year (1950–1969) to 14 issues per year (1998 to date). The *Journal* has been edited by Vernon D. Tate (1950–1951), Mortimer Taube (1952), Jesse H. Shera (1953–1960), Luther H. Evans (1961), James D. Mack (1962–1963), Arthur W. Elias (1964–1976), Charles T. Meadow (1977–1984), Donald H. Kraft (1985–2008), and Blaise Cronin (2009 to date).

The Annual Review of Information Science and Technology was first published in 1966. It surveys the landscape of information science and technology, providing the reader with an analytical, authoritative, and accessible overview of recent trends and significant developments. The initial volumes of this series were supported by a grant from the National Science Foundation. *ARIST* has been edited by Carols A. Cuadra (1966–1975), Martha E. Williams (1976–2001), and Blaise Cronin (2002–to date).

The proceedings of the annual meetings collect significant contributed papers. These proceedings are available on disc to meeting registrants and electronically through the ASIST digital library (which also includes the *Journal*, *Annual Review*, and *Bulletin*).

The *Bulletin of the American Society for Information Science* (formerly the Society's *Newsletter*) began publication in 1974. It is a bimonthly news magazine focused on developments and issues affecting the field, pragmatic management reports, opinion, and news of people and events in the information science community. Irene Travis was named editor in 1997; in 2007 the *Bulletin* became an electronic-only publication.

MEETINGS

Both the annual meeting, held in the fall of the year, and the special symposia provide important forums for communication among people of diverse interests. The annual meetings bring together researchers and professionals from virtually every field: attorneys, bankers, electronic and print publishers, government officials, businesspersons, librarians, engineers, social scientists, information managers, computer scientists, and many others. The topical summits feature presentations from research and industry leaders, opportunities for intense personal interaction, and awards recognizing excellence in all aspects of the field.

Special interest groups also organize and present specialized meetings. The SIG on Classification Research has conducted the highly regarded Workshop of Classification Research each year since 1990. The SIG on Information Needs, Seeking, and Use holds a research symposium in conjunction with ASIST annual meetings.

AWARDS

The American Society for Information Science and Technology's Award of Merit is the Society's highest honor. It is bestowed on individuals who have made noteworthy contributions to the field of information science, including the expression of new ideas, the creation of new devices, the development of better techniques, and outstanding service to the profession of information science. The Watson Davis Award commemorates the Society's founder. It is given to members who have shown outstanding continuous contributions and dedicated service to ASIST. The recipients of these awards are listed in Table 1.

CONCLUSION

The American Society for Information Science and Technology has responded to more than seven decades of change in our understanding and use of information technologies. It has evolved from an organization of institutions to an individual membership society. ASIST's meetings reach academic, industry, and professional audiences and the

society's long-standing publications increase their already high impact as they move to electronic formats.

Approval Plans

Robert Nardini

Vice President, Library Services, ProQuest Books, La Vergne, Tennessee, U.S.A.

Abstract

An approval plan is an acquisitions method under which a library receives regular shipments of new print books or activation of new ebooks selected by a vendor. The selections are based on a formalized profile of local collection interests, and a library has the right to reject what it decides not to buy. The dealer also provides electronic new title announcements which the library may use to place orders for titles fitting the profile less perfectly. Approval plans were first implemented in the 1960s and following a period of controversy, by the 1990s had become the predominant way larger academic libraries in the United States and Canada acquired new books. By 2010, the rise of ebooks, new acquisitions models, and new financial pressures had caused many libraries to stop or to reduce the size of their approval plans. The underlying profile mechanisms first developed to support approval plans, however, are still widely used for new title announcements and to support "Patron-Driven" or "Demand-Driven" acquisitions programs, as well as to generate new title selection records for use by librarians.

INTRODUCTION

An approval plan is an acquisitions method under which a library receives regular shipments of new print books or activation of new ebooks selected by a vendor. The selections are based on a formalized profile of local collection interests, and a library has the right to reject what it decides not to buy. Approval plans were first implemented in the 1960s, and following a period of controversy, by the 1990s had become the predominant way larger academic libraries in the United States and Canada acquired new books. By 2010, the rise of ebooks, new acquisitions models, and new financial pressures had caused many libraries to stop or to reduce the size of their approval plans. The underlying profile mechanisms first developed to support approval plans, however, are still widely used to support "patron-driven" acquisition (PDA) or "demand-driven" acquisition (DDA) programs, as well as to generate new title selection records for use by librarians.

HISTORY OF APPROVAL PLANS

The forerunners of the modern approval plan were begun after World War II, when mass-buying programs such as the Farmington Plan were organized to enable North American academic libraries to acquire books from areas of the world where war had disrupted the book trade or where buying books was otherwise difficult. Various types of domestic gathering plans or blanket order plans, as they were known, also appeared in the postwar years, when support from the federal government increased book budgets to the point where library staffs strained to spend their money through title-by-title firm orders.

In the early 1960s, Richard Abel, the manager of Portland, Oregon's Reed College Book Store, which had grown an extensive business with academic libraries, began a company dedicated to this market. His insight that vendor advance buying in anticipation of library orders could preempt the orders themselves, if books were shipped to libraries automatically, was the core of the approval plan concept. Within a few years, approval plans were widespread among North American academic libraries, growth enabled by automation of many of the company's processes.

The scale of Abel's operation outpaced his finances, however, and in 1974 the firm failed. To alarmed librarians and publishers, this put the future of the approval plan in doubt. But the venerable U.K. firm Blackwell's company bought the remains of the Richard Abel Company; by then, many libraries had come to depend on approval plans and several competitors offered their own programs. The idea not only survived the Abel demise but approval plans continued to spread.^[1-3]

Acceptance did not occur without dissent, however, because many librarians vigorously opposed approval plans. The most important forum for debate was a series of four conferences held from 1968 to 1979, organized by Western Michigan University's Peter Spyers-Duran.^[4-7] Some librarians argued against handing over to commercial interests the professional activity of book selection, fearing that lapses of undependable or unstable vendors and omissions by vendors focused on moneymaking would leave damaging gaps in library collections. Vendor concentration on mainstream, profitable books would produce library collections that were too much alike, without the collective richness resulting from local selection in support of local needs.

Vendors were aware, as these critics pointed out, that far more often than not libraries would keep a book shipped on approval, thus putting many marginal titles into collections. At the same time, it was difficult to predict whether a needed title would be shipped at all. A significant monitoring effort would be necessary to prevent gaps, to minimize unwanted titles, to eliminate duplication, and to stay within budget. The expense of this work, and the costly handling of returns, would erase any savings a library might gain with an approval plan.

None of these objections ever disappeared, but arguments in favor of approval plans proved stronger during this era. Efficiencies won from approval plans allowed libraries to reallocate staff to other duties, even to operate with less staff. Discounts, passed on from vendors able to buy from publishers in volume, helped to stretch budgets. The ability to acquire new books soon after publication, while sought by patrons and still safely in print, and to make selection decisions based on the book itself, rather than on reviews or publisher advertisements, were other reasons to establish an approval plan. Librarians administering budgets valued evenness in spending across the year, and librarians overseeing collections liked the subject balance approval plans ensured, even without strong local subject expertise.

Although Spyers-Duran and others debated critics of approval plans, the argument already had been won in the venue that truly mattered, library operations themselves. A survey published in 1977, only 3 years after the Abel Company's failure, found that 79% of respondents had approval plans.^[8] In 1979, Oryx Press saw enough demand to publish a handbook, *Practical Approval Plan Management*.^[9] A survey of Association of Research Library (ARL) members published in 1982 documented that 85% of these large libraries maintained approval plans, about the same percentage recorded by an earlier survey of ARL libraries in 1969.^[10] ARL surveys published in 1988 and 1997 remarked on the stability of the concept through good and bad financial times and found that more than 90% of ARL libraries used approval plans.^[11,12]

In 1999, a survey of nearly 300 libraries found high satisfaction with approval plans.^[13] Because many of these libraries reported annual approval plan expenditures under \$100,000, this survey documented what had long been evident in the literature, that use of approval plans had spread beyond research libraries. In fact, approval plans became nearly as common among medium-sized as among large academic libraries in North America, as well as among law, health sciences, art, and other specialized academic libraries. A study published in 2008 concluded that use of approval plans by college libraries had not declined.^[14]

TRANSFORMATION OF APPROVAL PLANS

In that same year, however, 1999, the first of four major events took place that directly or indirectly would

transform approval plans. This was the launch of netLibrary, an ebook platform heavily marketed to academic libraries. Other platforms offered by other companies followed, and the idea that ebooks might be included in approval plans was a natural result. Then, in 2005, Google announced a mass digitization project in cooperation with five research libraries, raising questions about the value of local collections. By then, the out-of-print book market had largely moved to the Web and it was no longer difficult to obtain most print books when and if needed, even long after publication, undermining what had always been an approval plan advantage. Finally, the financial crisis of 2008 overturned assumptions about the stability of library funding for collections.

Academic libraries responded to these changes by experimenting with new arrangements. In 2007, the University of Vermont's library stopped approval shipments for three large publishers. Instead, patrons were invited to request orders for these print books by using an online form resulting from an OPAC search, the library promising 3-day delivery if desired.^[15] Nova Southeastern University, in Fort Lauderdale, Florida, reported an ebook approval plan begun in 2009, and in 2010 Texas A&M University reported implementation of an "e-preferred" approval plan.^[16,17]

Academic librarians had only sporadically expressed interest about usage of their print collections. But the rise of ebooks and other electronic resources, where usage measures were common, combined with financial pressures after 2008, and with concerns over building space claimed by growing print collections, led many librarians to look critically at approval plans. A study completed in 2009 by librarians at Penn State University and the University of Illinois at Urbana-Champaign raised as a problem the high percentage of unused books acquired on their approval plans.^[18] The findings of a Cornell University Library task force published in 2010 did not directly question approval plans, but raised the same concern over books that did not circulate.^[19]

These concerns were widely shared, leading to a surge in the use of PDA or DDA programs.^[20–23] Often, approval plan profiles were modified to produce MARC records for use as patron selection vehicles, instead of or in addition to the traditional outputs of automatic book shipments and selection slips intended for librarians' use. The practice became widespread quickly enough for the chair of the Cornell 2010 task force to remark in 2011 that a summary was difficult to achieve, and to ask if U.S. academic libraries had not reached a "tipping point" toward the new method of acquiring books.^[24]

PROFILES

While many libraries have reduced or eliminated their approval plans, one enduring component of approval plans

has been the “profile” recording local collection interests and guiding the vendor in identification of pertinent titles. Vendors have their own systems of documentation, but all work with customers to create and then revise over time a profile that will be at the heart of an approval plan, or a profile devoted entirely or in large part to selection records for librarians, or today, a PDA/DDA program. Often, libraries establish multiple profiles with a vendor, by subject, publisher, library location, print/ebook format, or some combination of these. Libraries may also establish their own combinations of approval plans, librarian selection plans, and DDA programs, all working in parallel.

Profiles have several basic components that can be configured to produce the optimal combination of automatic purchases, library or patron selection records, and exclusions. Subject parameters are recorded by using standard library classification systems supplemented by a vendor’s own controlled vocabulary of subject terms. Vendors also designate categories of nonsubject descriptors for dozens of bibliographic categories such as textbook, reprint, country of origin, language, binding, and price. Publisher parameters are established as well. A list of authors important to a library might be included in an approval plan profile, and some vendors make it possible for libraries to incorporate book awards or significant review notices into a profile. Libraries may also embed their own descriptors for budget/fund and location in a profile, so that these local terms for fiscal and selection responsibility are assigned to each title generated by the profile, enabling ongoing analysis and accounting by both the vendor and library.

The advent of ebooks introduced a new set of components into profiles. A preference for ebook or print can be supported, as can an agreed upon number of days a library is willing to wait for their preferred format when it is not the first available. Libraries can also incorporate into their profiles preferences for the ebook platforms offered by different ebook aggregators and publishers, and for the various usage models defined by the license types those companies offer.

VENDORS

Vendors provide an array of services closely associated with their approval plans. Library approval plans often incorporate some level of technical services, where the vendor might provide cataloging records and, for print books, physical processing, which can include the application of spine labels, ownership stamps, security devices, and barcodes, as well as binding services. When physical processing is provided, libraries waive their right of return and no longer truly have an “approval” plan. These libraries, after having achieved a very low rate of return—perhaps 2% or 3% or even lower—calculate that the cost of returns outweighs any savings. Librarians may,

however, already have “approved” shipment of either print or ebooks using their vendor’s online interface. These online services are integral to approval plans, providing access to profiles, review of shipments, ordering and selection support, and management reporting. Vendors can also provide title metadata and library holdings information to OCLC’s WorldCat (Online Computer Library Center) and to discovery service providers.

Many vendors proved unable to provide the level of support approval plans require, one factor leading to consolidation in the industry. The 1999 acquisition of Academic Book Center by Blackwell’s, the 2006 acquisition of Coutts Information Services by Ingram, the 2009 acquisition of Blackwell North America by Baker & Taylor, the 2012 merger of the French vendors Aux Amateurs de Livres and Librairie Internationale Touzot, the 2013 acquisition of the United Kingdom’s Blackwell Library Services by Dawson Books, and the respective 2015 acquisitions first of YBP Library Services by EBSCO, and then of Coutts by ProQuest, were the most significant of these changes in the vendor landscape.

While many smaller vendors were also acquired or went out of business, other vendors continue to offer specialized approval plans. Among those providing European books are Casalini Libri, East View Information Services, Harrassowitz, and Puvill Libros.^[25] Other vendors include Rittenhouse Book Distributors and Matthews Book Company, for medical books; Theodore Front Musical Literature, for music scores; Worldwide Books, for art publications; and Midwest Library Service, who markets to smaller academic libraries.

CONCLUSION

Approval plans, which began as mechanisms for the mass acquisition of print books, have evolved into an interwoven set of systems for academic libraries and their patrons to discover titles in both print and electronic format, and for libraries to acquire the most locally pertinent in an efficient manner. While questions have been raised about the value of the collections academic libraries built through approval plans, due to the efficiencies they offer approval plans continue in use by many large academic libraries in the United States and Canada. There is no question, finally, that approval plans and the profiles now supporting PDA and DDA programs succeeded in what has always been one central goal, that is, to enable librarians to focus their work on activities other than book selection.

Arab Federation for Libraries and Information (AFLI)

Nour Soufi

Library Cataloging and Metadata Center, University of California, Los Angeles, Los Angeles, California, U.S.A.

Abstract

This entry provides an overview of the founding and the history of the Arab Federation for Libraries and Information (AFLI). The federation's objectives, membership, and organizational structures are discussed as well as its financing and conferences. The Arab Federation for Libraries and Information holds training and workshops in different Arab countries, publishes a newsletter "Sada al Ittihad" and publishes the proceedings of the yearly conferences in cooperation with the Association or the institution in the country where it is held. It also publishes a journal named IALAM twice a year. The Arab Federation for Libraries and Information also encourages and gives awards to the outstanding professionals in the field of library and information science.

INTRODUCTION

In the last 30 years of the twentieth century, many library schools were established at various Arabic universities. As a result, large numbers of students graduated in the specialty and needed jobs at different levels in libraries and in documentation and information centers. This growth in the number of trained professionals lead to the establishment of national level library associations in Arab countries. The oldest of these are the Egyptian Library Association, the Jordanian, and Iraq Library Associations.

From the point of view of library professionals these associations were not adequate to meet a deep-felt need for cooperation among Arab librarians. A broader organization was needed in order for this new generation of professionals to formulate mutual goals and work together for their accomplishment. Several Arab libraries recommended establishing an Arab federation for libraries and for information professionals. For example, the Round Table of the Regional Studies to Improve Libraries in the Arab Countries, which was held in Beirut in 1959, recommended the establishment of national associations as well as a regional association.^[1] The Seminar on Library and Information Science, which was held in Baghdad in 1977, recommended that the Iraqi Libraries Association to establish an Arab Libraries Association; then it recommended the same project at the seminar in Tunisia in 1979, but no progress was made in implementing the project at that time. The Jordanian Library Association requested the same project in 1984. The Jordanian Library Association then sent the proposal to the Arab Associations and Institutions involved in libraries and library sciences, and requested that they study it, and give their opinions. This project was revisited as well during the Seminar of Cataloging the Arab Books, which was held under the sponsorship of the Higher Institute of

Documentation in Tunisia in 1984. Despite all of these efforts, there were no positive outcomes.^[2] The second Arab Seminar held by the Higher Institute of Documentation (in Tunisia from April 5 to 7, 1985), focused on the theme "the benefits drawn from the services of the libraries and the Arabic documentation centers." Participants in the second seminar also stressed the importance of creating of an Association for Arab librarians, and they identified a need to create a directory of professionals and libraries in the Arab world.^[3]

FOUNDING

The project remained a dream for librarians, professionals, and information specialists in Arab libraries until January 19, 1986, when the 3rd Arab seminar was held in Qayrawan, Tunisia from January 16 to 20, 1986, where there was a round table to study this important project. Professor Dr. Abdul Jalil al Tamimi, the former director of the Higher Institute of Documentation in Tunisia, and at that time the owner of the Tamimi Institution of the Scientific Research, played a key leadership role during this seminar. In attendance were professionals in library science from Tunisia, Algeria, Saudi Arabia, Sudan, Syria, Iraq, Kuwait, Libya, Egypt, and Yemen. These professionals drafted some general policies during a series of four meetings and officially founded what they called "the Arab Federation of the Arab Librarians and the Specialists in Information." This name was later changed to "the Arab Federation for Libraries and Information (AFLI)." The first elected Executive Board included seven members; the chairperson was Dr. Wahid Qdoura, Professor at the Higher Institute of Documentation in Tunisia. However, the key leader who struggled to create the Arab

Federation was Dr. Abdul Jalil Al Tamimi formerly director of the same institute in Tunisia.

Beginning in 1986, the AFLI began to be active under the leadership of this Institute, which fully supported it. After a few years, the Tamimi Institution of the Scientific Research took over the responsibility of leading AFLI. Step by step, AFLI developed successfully due to the perseverance of information professionals and librarians. Its crucial role is to advocate for the development of libraries and to increase public awareness of the impact of libraries on cultural development in general.^[1]

OBJECTIVES

Like every federation, association, and institution, AFLI has its own objectives.

These objectives are to:

1. Strengthen cooperation among the societies and institutions in the Arab world.
2. Introduce and preserve the audiovisual and written Arab heritage everywhere.
3. Support all efforts to promote the profession and librarianship.
4. Conduct and encourage scientific research and studies in the field of libraries and information science, as well as hold specialized seminars, symposiums, and conferences.
5. Endeavor to improve the standard of preservice and in-service training institutes for librarians and specialists in information.
6. Work on the unification of information and library terminology.
7. Attempt to issue statutes and regulations concerning libraries and information institutions.
8. Participate in the publication of specialized guides and in the development of the profession.
9. Encourage the establishment of national societies of libraries and information specialists in those Arab countries where such societies have not yet been established.
10. Issue a specialized professional periodical as the organ of the federation.
11. Cooperate with those international and Arab organizations concerned with the same objectives of the federation.^[4]

MEMBERSHIP

There are four categories of membership in AFLI:

1. Category A includes library and information associations in the Arab countries.
2. Category B includes libraries, departments, and institutes of library and information science.
3. Category C includes qualified librarians or those who possess experience in the field of libraries and information for no fewer than 5 years.
4. Category D includes the honorary members who have made outstanding contributions to the profession and to AFLI.^[5]

ORGANIZATIONAL STRUCTURES

The Arab Federation for Libraries and Information organization consists of the following:

1. General Assembly
The General Assembly is the highest committee in the federation. It includes all the members of AFLI. It has the authority to assign general policy, and to define the program of its activities by considering suggestions which have been made by the executive board and members. It also decides the federation budget, and it examines and makes appropriate decisions on the following matters:
 - “The reports and recommendations submitted by the committees on the duties assigned to them by the executive board.
 - “The reports of the secretary general and the treasurer on the federation activities during the general assembly’s terms.
 - “Matters related to the field of librarianship and all items in the agenda.
 - “Suggestions on amendments to the statute and executive acts.
 - “Elects the federation chairman and members of the executive board.
 - “Approves the federation budget, and defines the annual subscription fees.”^[5]
2. The Executive Board
The general assembly elects an executive board every 3 years; it consists of seven members, divided into five groups as follows: Chairman, Vice Chairman, Secretary General, Treasurer, and three additional members. The executive Board has seven essential functions, which are:
 - Prepare the agenda of the general assembly, as well as the federation budget and the program of its activities.
 - Follow up on implementation of the program approved by the general assembly.
 - Transfer some of its powers as appropriate, to the chairman of any of its members.
 - Form the committees that it deems necessary to be responsible for the implementation of its functions.

- Invite individuals or representatives of institutions to attend its meetings as consultants, if it considers this necessary for the undertaking of its functions.
- Consider applications for membership of the federation.
- The chairman, or any member of the execution board assigned by the chairman, is authorized to sign contracts or bonds for selling or buying properties, or for paying rent.^[5]

Through 2007 there have been eight executive boards, chaired by:

- Temporary executive board: Chairman: Prof. Dr. Shaaban Khalifah (Egypt).
 - 1st executive board: Chairman: Prof. Dr. Wahid Qdoura (Tunisia).
 - 2nd executive board: Chairman: Prof. Dr. Wahid Qdoura (Tunisia).
 - 3rd executive board: Chairman: Prof. Dr. Abdul Jalil al Tamimi (Tunisia).
 - 4th executive board: Chairman: Prof. Dr. Abdul Jalil al Tamimi (Tunisia).
 - 5th executive board: Chairman: Prof. Dr. Wahid Qdoura (Tunisia).^[1]
 - 6th executive board: Chairman: Prof. Dr. Mabruka Mhiri (Libya).
 - 7th executive board: Chairman: Dr. Saad al Zahri (Saudi Arabia).^[6]
 - 8th executive board: Chairman: Prof. Dr. Hassan A. Alserihy (Saudi Arabia).^[6]
3. The General Secretariat
The General Secretariat works on editorial assignments, and implements the General Assembly and Executive Board's decisions.
 4. The Working Committees
Working committees are formed as needed. For example, standing working committees have been formed for bibliography, budget, knowledge production, training, terminologies standards, and international relations.

FINANCE

The Arab Federation for Libraries and Information obtains its financial resources and support from the subscriptions of members; from any profits of its conferences, services, and activities; and from the donations, grants, and other income. Financial decisions must be approved by the Executive Board.^[5]

LOCATION

The permanent location of AFLI is in Tunisia at the Tamimi Institution of the Scientific Research. This

foundation was established in 1989, by the greatly appreciated efforts of Professor Dr. Abdul Jalil al Tamimi, in Zaghwan, a city in Tunisia about 55 km from the capital of Tunis. The Tamimi foundation building consists of a library that contains more than 18,000 titles. The Foundation also produces three journals, the *Magazine of Maghrebi History*, the *Arab Magazine of Archives, Documentation and Information* and the *Arab Historical Review for Ottoman Studies* (AHROS).^[7]

CONFERENCES

The Arab Federation for Libraries and Information organizes yearly scientific seminars and conferences. The first six seminars were held in Tunisia. Dr. Abdullatif Soufi (former professor in Library Science at the University of Constantine in Algeria) then suggested that AFLI start holding its conferences in different Arab countries, and the organization began doing so starting with its seventh seminar. This was an important challenge and step that led to AFLI being known to a wider range of librarians and professionals in all Arab countries. From that point onward, membership tripled, until it grew to about 450 attendees per conference. These seminars and conferences were held as follows:^[1]

- 1st Arab Seminar: held in Hamamat (Tunisia) from February 23 to 26, 1988. Titled "Indexing and classification in the Arab information centers."
- 2nd Arab Seminar: held in the capital of Tunisia from January 18 to 21, 1989. Titled "Information and telecommunications technology in the Arab world: the challenges of the future."
- 3rd Arab Seminar: held in Zaghwan (Tunisia) from October 20 to 23, 1991. Titled "Information in the development service in the Arab world."
- 4th Arab Seminar: held in Tunisia from December 4 to 6, 1993. Titled "University libraries under the service of scientific research and education in the Arab world."
- 5th Arab Seminar: held in Zaghwan (Tunisia) from October 21 to 23, 1994. Titled "the position of studies in libraries and information science in our Arab world: perspectives of the future."
- 6th Arab Seminar: held in Tunisia from October 24 to 26, 1995. Titled "National and public libraries, their roles in the elaboration of national systems of information."
- 7th Arab Conference: held in Amman (Jordan) from November 2 to 6, 1996. Titled "Edition and bibliographic control in Arab scholarly publishing."
- 8th Arab Conference: held in Cairo (Egypt) from November 1 to 4, 1997. Titled "Information technologies in the libraries and information centers in Arab countries: current and future trends."

- 9th Arab Conference: held in Damascus (Syria) from October 21 to 26, 1998. Titled “The unified Arab strategies of information in the era of telecommunications and other studies.”
- 10th Arab Conference: held in Nabeul (Tunisia) from October 8 to 12, 1999. Titled “Electronic publishing and information services in Arab world: perspectives on future trends.”
- 11th Arab conference: held in Cairo (Egypt) from August 12 to 16, 2000. Titled “Towards building a strategy to enter Arabic printed literature into cyber space.”
- 12th Arab conference: held in Sharjah (United Arab Emirates) from November 5 to 8, 2001. Titled “Arab libraries in the third millennium: infrastructure, technology, and manpower capabilities.”
- 13th Arab Conference: held in Beirut (Lebanon) from October 29 to November 1, 2002. Titled “Electronic information directory: knowledge and efficiency.”
- 14th Arab Conference: held in Tripoli (Libya) from December 14 to 18, 2003. Titled “Knowledge engineering in Arab world.”^[8] During 2004 to 2005, AFLI had some problems concerning changing the location of AFLI from Tunisia, where AFLI was born, to Cairo. Because of these problems, AFLI held two conferences: the first in 2004 in Egypt and the second in Tunisia in early 2005. After this, the conflicts were resolved.
- 15th Arab Conference: held in Alexandria (Egypt) from December 27 to 30, 2004. Titled “Arab libraries and the educational development in a challenging world.”^[9]
- 16th Arab Conference: held in Hammamat (Tunisia) from March 2 to 5, 2005. Titled “Libraries and documentary information services: contribution to the emergence of the knowledge society.”^[10]
- 17th Arab Conference: held in Algiers (Algeria) from March 19 to 22, 2006. Titled “Access to information for all: partnership between librarian and archivists.”^[11]
- 18th Arab Conference: held in Jeddah (Saudi Arabia) from November 17 to 20, 2007. Titled “Librarianship: current challenges and the future and its role in the free access to scientific information.”
- 19th Arab Conference: held in Cairo (Egypt) from November 24 to 26, 2008. Titled “Cooperation among Arabic Information Institutions in the digital era.”
- 20th Arab Conference: will be held in Casablanca (Morocco) from December 9 to 11, 2009. Titled “Towards a new generation of Information systems and Information specialists: a future look.”

TRAINING AND WORKSHOPS

From time to time, AFLI organizes workshops and continuing education for librarians, and also sponsors workshops in cooperation with the national library associations

and information centers (like the Arabian Advanced Systems), in order to develop librarians’ knowledge and capabilities in the use of information technologies, and the use of new systems. Any member from any Arab country who wishes to learn more about these technologies may attend. The Arab Federation for Libraries and Information also cooperates with the International Federation for Libraries and Information.^[12]

AFLI PUBLICATIONS

The Arab Federation for Libraries and Information cooperates with other Arab institutions, like libraries, universities, and other federations, in regards to publishing the proceedings of the yearly conferences. These publications include abstracts and papers which were presented at the conferences. The proceedings are distributed free of charge to members who present papers at the conferences. Others may purchase a copy. The Arab Federation for Libraries and Information also publishes a periodical, “Sada Al-Ittihad” that reports on AFLI’s activities during the current year, provides information on its members accomplishments, and lists current research in the field, as well as published books, conferences, and seminars. The Arab Federation for Libraries and Information also provides additional activities at every conference, such as book exhibitions, new technology exhibits, etc.^[1]

RELATIONSHIPS AND COOPERATION

The Arab Federation for Libraries and Information maintains relationships with other library associations both in Arab countries and internationally. It organizes its conferences in cooperation with national library associations (depending on the country where the conference is being held), such as the Egyptian Library Association, Jordanian Library Association, and with Arab universities and with other organizations such as The League of Arab States, The Arab Club of Information in Damascus, etc. The Arab Federation for Libraries and Information tries to support these relationships by setting the yearly conferences in different Arab countries, in order to allow the largest number of librarians in each country to contribute to and attend its conferences.^[2]

HONORS AND AWARDS

Beginning in 2000, AFLI started to give awards to its outstanding members, who had contributed with distinction to excellence in the field of Library and Information Science, either through scholarly contributions or by working on committees. Until now, AFLI has presented four outstanding member awards, as follows:

1. Prof. Dr. Shaaban Abdelaziz Khalifah (Egypt), Professor in the Egyptian universities, received the award at the tenth AFLI conference in 1999 in Tunisia.^[1]
2. Prof. Dr. Abdullatif Soufi (Algeria), Professor in Library Science in the University of Mentouri Constantine, Algeria, received the award at the 13th AFLI conference in 2002 in Beirut.
3. Prof. Dr. Abduljalil Al-tamimi (Tunisia), Owner of the Tamimi Institution of scientific research, and former president of AFLI, received the award at the 14th AFLI conference in 2005 in Libya.
4. Prof. Dr. Wahid Qdoura (Tunisia), Professor at the Higher Institute of Documentation (Tunisia), received the award at the 16th AFLI conference in 2006 in Algeria.^[6]
5. Prof. Dr. Mohamed Fathi Abdulhadi (Egypt), Professor at the Institute of Library and Information Sciences (Cairo University), received the award at the 18th AFLI conference in 2007 in Jeddah (Saudi Arabia).
6. Prof. Dr. Abubakr El Houshe and Prof. Dr. Mabruka Mhiriq (Libya), Professors at the Institute of Library Science (Libya), received the award at the 19th conference in 2008 in Egypt.

CONCLUSION

The Arab Federation for Libraries and Information, is the only such federation in the Arab countries. It brings together professionals and specialists in the Arab libraries and information institutions for purposes of communication and provides a forum for discussing the current situation and the future trends of their profession. It supports cooperation and encourages research. The Arab Federation for Libraries and Information supports professional

development and assists in the training of librarians in the Arab universities and institutions. It also works on codifying terminologies and encourages formation of national library associations. In addition, AFLI strengthens the relationships between these national library associations and international associations in the profession. Finally, AFLI continues to hold its yearly conferences in different Arab countries, and grant honors and awards to outstanding professionals.

Archival Appraisal and Acquisition

Barbara Reed

Recordkeeping Innovation, Sydney, New South Wales, Australia

Abstract

Archival appraisal is the analytic process involved in determining how long records are required, thus driving acquisition strategies, and determining the archival record left for the future. Developing as a major archival function during the twentieth century, appraisal has been subject to intensive professional discussion as archivists search for theoretically sound approaches and techniques. The advent of the digital environment has created great challenges for appraisal theory and practice. This entry outlines the purpose and principles underlying appraisal, discusses the development of traditional appraisal practices, identifies professional concerns with traditional appraisal practices, and discusses methodologies and approaches proposed as alternatives to traditional appraisal methods to address digital recordkeeping challenges.

INTRODUCTION

Appraisal is the set of recordkeeping processes involved with determining how long to keep records, and what ultimately will become the archival representation for the future. Appraisal is possibly the most contested of archival functions and the most discussed in the professional literature. Definitions of what appraisal encompasses and methods of achieving reliable and replicable appraisal outcomes are in discussion.

Perhaps most strongly associated with the public (or government) record tradition, appraisal also has a manifestation in acquisition strategies employed by collecting archives, that is, those archives that target specific records for acquisition into focused collections held in a dedicated repository maintained independently by a third party as distinct from the record-creating body/person. These traditions are not the same, one focusing on a selection process, a winnowing of the extant records into a kernel for continuing preservation, and the other focusing on identifying records which are of sufficient significance to justify expenditure of a third party entity collecting and therefore implicitly undertaking the expense and responsibility for continuing preservation of the records. While there is a relationship, one is a selection process and one is a collection process. These processes therefore have different techniques associated with appraisal.

In recent years, the advent of digital recordkeeping has challenged recordkeeping processes in general, and appraisal techniques developed to suit the paper-based world have been subject to extensive discussion. The paper-based, reactive, and physical examination-dependent techniques of the past are widely acknowledged to be unscalable to meet the challenge presented by the digital environment. The struggle to rearticulate appraisal

techniques and develop an appraisal theory that is coherent, timely, and effective in the digital environment, is an ongoing process.

This entry

- Outlines the purpose and principles underlying appraisal.
- Discusses the development of traditional appraisal practices.
- Identifies professional concerns with traditional appraisal practices.
- Discusses methodologies and approaches proposed as alternatives to traditional appraisal methods to address digital recordkeeping challenges.

WHAT IS APPRAISAL?

Traditionally, archivists define appraisal as the intellectual process of determining the value of records. By determining the value of records, it is then possible to arrange for their orderly disposal/disposition by organizing their transfer to a secondary storage facility or to an archival institution for destruction or retention as appropriate. Usually formal documentation is devised, following the evaluative process, which lays out the classes of records requiring similar disposal action. It is, in simple terms, the process which determines which records should be kept and which should be destroyed. It is therefore the most important archival activity around which all other tasks revolve as it determines what is acquired by an archival institution.

Appraisal evaluates records in their recordkeeping, organizational, and wider social context; in terms of their origin, their functional, evidential and research

characteristics; their relationship with other records; their age, volume, and physical format and the long-term cost of preserving them in appropriate archival storage or their destruction once they have fulfilled their administrative and legal requirements. Traditionally, appraisal occurred when records were no longer of current administrative use.

APPRAISAL TRADITIONS

Prior to the mid-twentieth century, appraisal, or the determination of which records should be retained as archives, largely evolved in practice. There was little articulated theory of appraisal, but rather codification of specific practices. The practices evolved dependent on the nature of the archival system in place.

European Traditions

In European archival theory, appraisal was initially the responsibility of the record-creating body. The identification of which documents were superseded by others or which were destroyed was embedded in procedures undertaken as routine by record-creating bodies. In more modern times categories of records able to be destroyed were formalized by regulations devised by Committees established for this purpose. Within this tradition, some forms were seen as requiring more secure protection and were removed for safe keeping outside the records creating body. From the 1920s European archivists gradually established the principle that they should be consulted before any records were destroyed.^[1] Archivists were involved in determining what should be retained once the material was no longer needed for administrative purposes.

The European recordkeeping tradition argues that the presence of records in the archives repositories creates a web of relationships between the records which in itself constitutes meaning. The archivists' role was not to select, but to protect these records and their context. Archivists actively involved in selecting within these designated records risk destroying the archival bond and alienating the characteristics of authenticity and reliability.^[2] This was incorporated into English-speaking traditions through the work of Sir Hilary Jenkinson in his *A Manual of Archival Administration*, first published in 1922. Jenkinson stressed the impartiality of the archivist and physical and moral duties to the record. He warns against active involvement of archivists in destruction which can equate to the archivist and/or historian having a role in records creation and at risk of imposing a personal judgment of value. Such actions negate the principle of impartiality of the archives and involves the archivist in the contested territory of determining the historical record. Jenkinson's view places the appraisal processes including disposal decisions with the individual agency/office of origin.^[3]

Guidance on appraisal criteria was established as early as 1901 within the German tradition, encompassing principles such as respect for age, that records created for temporary purposes generally should be able to be destroyed, that the nature of the administration (both function and structure) should determine the relative importance of records for continuing retention.^[4]

Further into the twentieth century, archivists began to be more actively involved in setting appraisal standards. The efforts of Prussian archivists to reject the *laissez-faire* *fingerspitzengefühl* (finger in the wind) methods of determining appraisal were reported in 1937,^[5] resulting in more defined appraisal criteria based on an analysis of the relative functions and positioning of the creating body.

A more function/structure approach was developed to combat subjectivity in appraisal decision making. The Prussian archivists were concerned primarily with the "quality" of the record for historical research. In 1926, Karl Otto Muller proposed a division of records according to administrative level—central, intermediate, and local authorities—with the proposition that central agencies of government would create more valuable records than local ones. This subsequently developed into the 1950s proposition that rather than looking at the record level, the agency as a whole could be defined as being "more or less worthy of permanent preservation" and that agencies could be ranked according to their importance. The administrative level of the agency and the degree of independence in decision making were factors in the ranking. Georg Wilhelm Sante:

Archivists must make their selection with a view to the function of the departments and the significance attached to that function. They must begin by analyzing the functions of the individual agencies, and only thereafter can the records produced by these agencies be appraised.

—(1956–1957). Quoted in Booms.^[6]

By 1957 in Germany there was a call to "cease the practice of simply disposing of valueless records and to adopt instead the principle of selecting valuable records." This interesting concept reverberates through a number of traditions of appraisal. Ole Kolsrud in discussing the 1981 Wilson Report reviewing the Public Record Office U.K.'s appraisal system writes "it suggested that the time had come to concentrate more on preservation than destruction" and similarly in Australia, "The Australian Archives records disposal policy in 1979 shows a shift in emphasis from the need to justify the destruction of records to a requirement involving the critical appraisal of material to justify permanent retention" in Dianne Easter "Records Disposal in the Australian Archives" *Archives Conference 1979. Papers Presented to the Second Biennial Conference of the Australian Society of Archivists, Sydney May 18–20, 1979*, Supplementary Volume, p. 37. The German practice also strongly argued that records could not be appraised in isolation but must be placed in their

administrative context.^[7] These ideas were not particularly well translated into practice at the time. However these ideas clearly influenced Schellenberg, through the translation of the lectures and papers of Adolf Brenneke, cited in the Introduction to *Modern Archives*. These ideas similarly had an influence on the work of Hans Booms in the 1970s and indirectly through Booms on Terry Cook in the 1990s.

In Britain, the demands for paper salvage efforts associated with World War II led to the first articulation of appraisal principles in relation to government records, stressing again that those responsible for the conduct of the business should decide which records should be preserved for business purposes, and that an additional set of criteria would be added to that to serve the requirements of historical or general uses. The historical or general uses were to show history of the organization concerned, to answer technical questions regarding its operations and to meet possible scholarly needs for the information that is incidentally or accidentally contained in the records.^[7]

Post World War II, a huge proliferation of records occurred as a result of the rapid expansion of government functions, the diverse scope of their activities, and the ability of machines to duplicate records. Large-scale destruction of records became inevitable. The costs of preserving more than a small fraction of the records produced was prohibitive.^[8]

American Traditions

T.R. Schellenberg codified the American practice in 1956 in his highly influential book *Modern Archives*. This work built on practices already in place within the (then) National Archives and Records Service, articulating criteria for appraisal work based on the distinction between “primary” (or values to the originating agency) and “secondary” (values for other agencies and private users). Records having secondary values were broadly categorized as having “evidential” and “informational” value. Schellenberg defines these categories quite broadly. Evidential value does not reference the Jenkinsonian notion of the sanctity of evidence in archives that is derived from unbroken custody, nor of the value that inheres in public records because of the merits of the evidence they contain. Rather, evidential value is the value that depends on the importance of the matter evidenced, that is the organization and functioning of the agency that produced the records. Informational value is “the information they [records] contain on persons, corporate bodies, problems, conditions, and the like, with which the government body dealt.” Schellenberg’s text went on to consolidate what constituted examples of both of these value criteria.

Following Schellenberg, much of the writing on appraisal during the last half of the twentieth century focused on developing criteria through which to assess

value. Taxonomies of values were developed: evidential, financial, administrative, research values are still the most common means of evaluating records in practice. Appraisal criteria based on these taxonomies of value became the norm, and for many archivists today, continue to be the basis for appraisal decision making.

APPRAISAL TOOLS

Collecting or Acquisition Policies

During the 1980s, particularly in America, collecting archives borrowed from the library tradition of collection development.^[9] A response to limited and contracting resources and to an expanding universe of responsibility saw collecting archives attempt to rationalize and define boundaries for their collecting activity.

The collecting policy, or acquisition policy, establishes the scope of the collecting remit—defining what will be accepted and under what conditions. They enable decision making against an established framework to determine whether specific material identified or offered to a collecting archives will be accepted for continuing preservation as archives.

Collecting policies typically cover

- Information about the legal status of the repository and its authority to collect.
- Information about scope or limitations of the policy (e.g., geographical area, subject name, chronological period or genre/media).
- Information about the process of collection, such as methods of acquisition—donations, loans, and conditions associated with ownership.
- Information about the rights to dispose or deaccession material.
- Information about access to the material.^[10]

Initially a tool used by collecting archives, by the late 1990s many government archives had adopted this tool to broadly outline the rationale for decision making on what records would be accepted into archival custody.

Disposal/Retention Schedules

Early twentieth century appraisal practice in European countries favored the development of lists of records proposed for destruction. These lists were examined by archivists and authorized prior to destruction of records. As archival practices became more codified, archival institutions were increasingly granted authority over the appraisal process or the business of determining which records to keep through archival legislation which generally provided the mandate for their responsibility to determine which records would be selected as archives.

As a development from the simple listing and authorizing of specific records for destruction, formalized disposal/retention schedules were developed. These tools were issued by an archival authority to enable the ongoing authorization of destruction or transfer to archival storage of records nominated within the schedule. Particularly associated with the work of the U.S. National Archives and Records Administration (and its predecessors), the technique of issuing disposal authorities is still the most common form of records disposal/disposition authorization.

Disposal/retention schedules list categories of records which are assigned a retention span based on a time period. Categories in such schedules which share a retention period are known as disposal classes. Disposal authorities can be specific to one agency, or part of an agency, or may cover records that are common/general to many agencies. They provide, for the period of their currency, a continuing authority for agencies to destroy records which fall within the disposal classes, without any further authorization from the authorizing body.

Responsibility for preparing disposal/retention schedules was variously placed with archival authorities or with records staff in agencies. Compiling disposal schedules embodies appraisal decision making. The process of developing a disposal schedule typically involves identification of the records to be covered, an analysis of the related function/process/transaction, an analysis of recordkeeping systems and information flow, compilation of information about the records being targeted (including volume, system of arrangement, physical condition, frequency of use etc.), development of broad classes of records sharing a retention period, consideration of appraisal criteria and, more recently, justification of the retention period proposed against mandates such as operating legislation and internal and external stakeholder requirements.

Generally agencies are responsible for the determination of the primary value (i.e., the values for the originating agency itself) and archivists in an archival institution are responsible for the determination of secondary values (i.e., values for other agencies and private users).

Systemic Reviews

Practice in the U.K. post-Jenkinson era modified his position on appraisal as reflected in the practices of the Public Record Office (PRO). Following the recommendations of The Grigg Report of 1954,^[11] the PRO implemented a system of regulated life cycle reviews which comprised the basis of their practices from the 1950s to the 1990s. The practice was based on a network of departmental record officers responsible for working sequentially with records creators and Public Record Office Inspecting Officers to undertake a series of reviews at different points of time each with a predetermined point of view.

At the point when records were no longer required for current business, they were moved to remote storage. Five to seven years after their movement to remote storage they were reviewed by administrators 'to determine whether the organization needs the records for its own administrative purposes . . . interpreted broadly to encompass issues such as continued accountability.' While originally there was an assumption that records would have no research value, modifications to the methodology over time introduced a consideration of research or informational value. Once the first review was completed, the remaining records continued to be stored in remote storage until 25 years after the creation of the record. A second review by Departmental Officers accompanied by a Public Record Office Inspecting Officer was undertaken at this time on a file by file basis with the primary consideration the research value of the records. The records determined to possess this value were transferred to the Public Record Office.^[12]

Sampling

Case-based records, or particular instance papers as they were known in the British tradition, caused problems for archivists with their voluminous nature and their basically repetitive structure—for example, taxation files, personnel files, or individuals' medical files, in which each document records the same basic process conducted for many individual instances with differing circumstances reflecting individual experiences. The technique of sampling such series became the accepted practice. Sampling could be either random (using genuine statistical methods), illustrative (selecting cases that illustrated the business process), chronological (selecting the complete records of a given period of time), or sequential (selecting every 10th case).^[13]

Implementing appraisal decisions, whether embodied in a collecting policy, in disposal/retention schedules or in sampling plans, involved a physical process of examining records and determining whether or not they and their history of compilation were such that they fitted into specific categories. Depending on which categories, the records would be designated either archives and destined for retention in archives or allocated a retention period after which they could be (with appropriate documentation) destroyed.

UNEASE WITH APPRAISAL PRACTICE

Appraisal has always been a contested process. Described as evaluation, it involves application of individual judgment, which, even when bounded by rules or criteria, will always be subject to differing opinions. Using the same rules and processes, will two appraisers always reach the same conclusions on value?

Lack of documentation, or inadequate documentation, of appraisal decision making in the past, and records taken into archival custody in last minute emergency rescues have all raised the controversial specter of reappraisal.^[14] When, in what circumstances and how should records determined to be archives be deaccessioned?

The techniques of implementing appraisal as articulated in these methodologies was physically focused—records were examined and evaluated against the appraisal criteria, collection policy, or retention/disposal schedule. The determination of value came after the record was finished—at the end of its administrative usefulness. By the mid-1980s the flood of material requiring coordinated appraisal swamped the capacity of any archival organization or collecting body to deal with the physical universe within its jurisdiction or collecting domain. As David Bearman put it, archivists were failing in their mission using these methods by orders of magnitude,^[15] and this assessment was made before the tsunami of digital records, which are unable to be physically inspected, had much impact on mainstream professional practice.

The results of archival appraisal were implicitly recognized to be the creation of a “representative” reflection of our society. But representative of what? Whose view was to be represented? Was it to be representative of all recorded memory, of activities or members of society, or of those aspects determined at a particular time to be important to social activity?

At much the same time, the growth of social history was focusing much historical scholarly activity on the experience of individuals, reflected in the archival records amid the case files or particular instance papers. Traditional archival appraisal practices using samples to deal with this type of record were being questioned.

From the archival institutions themselves came concerns with the foundation of appraisal on taxonomies of values, approaching appraisal from the bottom up and being overwhelmed by the vastness of the records to appraise and being unable to formulate methods which will work with the digital environment of the modern office.

Perhaps most of all, these unsettling questions that arose during the last decades of the twentieth century pointed to the lack of capacity to evaluate the success or otherwise of the appraisal decision-making processes. To what extent were archivists accountable for their appraisal decision making and how did they report on and justify their appraisal practices?

These questions arose from professional practice at the same time as the postmodernism philosophy was extending into humanities disciplines provoking a reconsideration of the reading of texts. The postmodernist discourse also raised a greater awareness of the real and symbolic exercise of social power in decision making about the representation of the past.

ALTERNATIVE APPROACHES TO APPRAISAL

Documenting Society

Inherent in the notion of evaluation of records is the notion of framing or shaping the form that the archival record will take for future generations. The evaluation appraisal criteria introduced by Schellenberg contrasts with the more passive notions of accumulation or elimination of the valueless which is the characteristic advocated by the European and Jenkinsonian approach. But the subjectivity that this approach introduces requires models for active documenting and these models are generally lacking. There is however, a history of attempts to address this issue, and the influence of the collecting traditions become particularly important in this regard.

Hans Booms, writing in German in 1971 (translated into the English professional literature in 1987), rejects the notion that administrative structure and positioning is the appropriate basis for appraisal. He argues for a much more socially situated approach to “the formation of a documentary heritage” focusing on the content of the records to reflect social processes. This requires a comprehensive view of the total societal development process and an interpretation of the way in which society has actually developed and forms a documentation model from which the archivist forms the documentary heritage.

East German archivists were actively experimenting with appraisal during the 1970s and beyond. Their practice was based on the proposition that “the value of archives is determined by the social importance of the events, activities and subjects it refers to”^[16] and that

documents got their value through their importance for fulfilling of the manifold tasks a socialist society sets itself for carrying through the historic mission of the working class. Furthermore it was declared that the function and the place of an administrative body defines essentially the information potential and relevance of its documents . . . and thereby their value.

East German attempts to implement Booms’ ideas during the 1980s resulted in the development of a list of some 500 events which ought to be documented. Angelika Menne Haritz warns of the problem in this approach which “fits the records into a politically desirable image of history,”^[17] references great difficulty in implementation and warns

As important decisions are delegated to authorities outside the profession, archivists are reduced merely to executing guidelines that we cannot investigate, even if they cause us to act as instruments for political purposes we would not support as individuals.^[17]

Documentation Strategies

Within the collecting archives domain, the concept of documentation strategies was articulated initially by Helen Samuels in the mid-1980s. This appraisal strategy articulates active and targeted documenting according to a collaborative cross institutional strategy. In essence a documentation strategy

is a plan formulated to assure the documentation of an ongoing issue, activity, or geographic area. The strategy is ordinarily designed, promoted, and in part implemented by an ongoing mechanism involving records creators, administrators (including archivists), and users. The documentation strategy is carried out through the mutual efforts of many institutions and individuals influencing both the creation of the records and the archival retention of a portion of them. The strategy is refined in response to changing conditions and viewpoints.^[18]

Reports on one of the projects which attempted to faithfully follow the theoretical proposal concluded that the methodology is “to supplement rather than replace the traditional methods of archival appraisal.”^[19] The idea of the documentation strategy is in the tradition of the documentation plan articulated by Hans Booms and also has echoes in the collaborative collecting of library institutions. Now seen as something of an unachievable aim, the concepts have had some influence, most notably in focusing attention on under represented areas of collection and cross institutional cooperation.

Macro Appraisal

Influenced by Hans Booms, and the writings of sociologists such as Anthony Giddens, Terry Cook has articulated the concept of macro appraisal, the first coherent appraisal theory. Macro appraisal attempts to capture the significant activities of government and its interaction with the society in which it exists. That is, it attempts a more holistic and strategic approach to appraisal of government records. Macro appraisal adds a layer of appraisal methodology that sits above the appraisal of individual agencies.^[20]

Archivists seek to understand why records were created rather than what they contain, how they were created and used by their original users rather than how they might be used in the future, and what formal functions and mandates of the creator they supported rather than what internal structure or physical characteristics they may or may not have.^[21]

The theoretical focus of macro appraisal is the

“image” of society—that is to say, not on the objective reality of society per se, which can never be known absolutely, but rather on the mechanisms or loci in society

where the citizen interacts with the state to produce the sharpest and clearest insights into societal dynamics and issues It is at these points of sharpest interaction of the structure, function, and client that the best documentary evidence will be found.^[21]

Essentially the focus is on “documenting the process of governance rather than of governments governing and corporations operating.”

The critical feature of macro appraisal is the need for detailed analytic work in advance of consideration of the records of an agency. It is a “top-down” approach that provides a solid and justifiable framework for decision making about records of individual functions. It enables prioritization of scarce resources to focus on those functions of government identified which require the most intensive documentation into the future as part of the archives. It is a media-neutral strategy, equally applicable to records in all formats, although implementation strategies for various media may need different approaches. It removes the reliance on the physical examination, moving appraisal to an intellectual process made within a stated framework.

Macro appraisal theory has influenced practice internationally,^[22–24] and can be seen as a part of a broader professional refocusing on the notions of provenance as a core archival tenet.

Minnesota Method—Functional Analysis for the Collecting Domain

The notion of functional analysis moved further into discussions of acquisition strategies for collecting archives with the development of the “Minnesota method,” a combination of collection analysis, documentation strategy, appraisal, and functional analysis.^[25] Originally articulated in the late 1990s,^[26] this approach developed to address the reality that collection or acquisition policies for most collecting archives were unachievably large. This approach involved defining and analyzing the particular area in the collecting policy, determining the documentary universe for that area, defining criteria for prioritizing and applying the criteria, defining the functions most appropriate to the collecting area and the level of documentation to support those functions.

Functions-Based Appraisal

If macro appraisal with its inherent requirement for a formalized and well-defined analytic framework established in advance of any appraisal decision making was too grand an undertaking for many archival institutions, the revitalized emphasis on functions as the basis of appraisal practice was not.

The integration of functions as a core recordkeeping tenet was reinforced in the International Standard on

Records Management, published in 2001. Function and activity is defined as the basis for both records classification in current records systems and as the basis for decision making on retention or destruction periods. The explicit linking of the two recordkeeping processes enabled the implementation of appraisal decisions at the time of records creation, thus providing both an intellectual coherence to recordkeeping processes which could be established in advance of records creation, and proactively addressing the process of decision making on length of retention.

REVIEW OF TRADITIONAL APPRAISAL METHODS

By the late 1990s and early years of the twenty-first century all archival institutions were acknowledging that the traditional methods of appraisal and implementing appraisal decisions were not adequately coping with the volume of records to be appraised, the resources available, or the nature of the increasingly digital record in the workplace. Various strategies have been adopted by individual archives.

The most developed implementation of macro appraisal is at the (now) Library and Archives Canada, where framework documents for the approach include an Acquisition Policy, Appraisal Strategy, Government Wide plan, and institutional profiles. The outcomes of the approach are Multi Year Disposition Plans “which formally set down records disposition project targets over a period of time according to criteria and priorities mutually agreed between the National Archives and the client at a senior management level, and Implementation Timetables. Revisited and modified in 2003–2004, macroappraisal continues to underlie the practices of Library and Archives Canada and has proven successful in enabling a coherent approach to the growing volume of government records and encompassing records in all media.”^[20]

At the same time that the Canadians were implementing macroappraisal strategies, the Dutch government were also undertaking an appraisal process focused on analyzing the functions of government in order to intellectually identify those functional areas of government producing the records required as archives.^[27]

The National Archives (TNA) United Kingdom revised its appraisal framework in the late 1990s, continuing to use the notion of graduated time-based reviews established by the Grigg Report framework of 1954 for paper-based records, but varying the time intervals. New tools, Operational Selection Policies, apply the selection criteria established in the Acquisition Policy to records of individual government agencies or cross institutional themes. These are issued either as ongoing authorities or for records covering a specified time period. Combined with a focused acquisition strategy, TNA has a more proactive strategy for digital records and data sets.^[28]

The U.S. National Archives and Records Administration (NARA) is similarly experimenting with approaches to appraisal. In 2004 its strategy for flexible scheduling was introduced to overcome the reality that NARA’s previous methodology for appraisal was too resource-intensive for agencies to implement. The revisions to the process sought to transfer much greater responsibility to agencies to determine both the levels and the groups of records which would be treated as disposal classes. It encouraged agencies to use flexible scheduling, big buckets, and records retention bands.

Flexible scheduling provides for concrete disposition instructions that may be applied to groupings of information and/or categories of records. Flexibility is in defining the record groupings, which can contain multiple records series and electronic systems.

A “big bucket” or large aggregation schedule is a type of flexible schedule. Flexible scheduling using ‘big buckets’ or large aggregations is an application of disposition instructions against a body of records grouped at a level of aggregation greater than the traditional file series or electronic system that can be along a specific program area, functional line, or business process.

Record retention bands “Specify a time band that provides both minimum and maximum retention periods for records. Example: Destroy when records are no less than 3 years old but no more than 6 years old.”^[29] The new policy direction was accompanied by four strategies aimed at coordinating records scheduling to business areas and lines of business defined in the government’s information architecture framework.^[30]

In Australia, the National Archives of Australia established strictly regulated processes based on the “Developing and Implementing a Recordkeeping System” (DIRKS) methodology, a version of which had been incorporated into the International Standard on Records Management (ISO 15489). This approach adopted the framework of records continuum thinking and sought to establish partnerships between agencies and archives in establishing consistent recordkeeping frameworks for the whole of government’s records, for however long they are required. This approach explicitly linked the creation of business classification schemes to appraisal decision making. Proposals on the appropriate retention period for records were made by agencies to the Archives, based on extensive documentation and risk analysis. The Archives then reviewed individual agency proposals for consistency with their published appraisal directions. Revised substantially in 2007 the degree of agency justification and documentation for records recommended for short-term retention has been minimized to focus on a more balanced risk-based approach, focusing on those records determined to have continuing value.

These approaches, while all responding to the individual needs of the jurisdiction, have features in common. They all stress a more coherent function basis for appraisal decision making. There is less emphasis on identifying and documenting individual records series, and greater emphasis on identification and documentation of functions that create records. The resulting disposal/disposition instruments are media-neutral enabling agencies to vary the format and media of records relating to specific functions rather than having authorizations tied to specific records, series, or formats. The principles of risk management have been acknowledged in these approaches, with greater latitude for agency decision making in the realm of appraisal, particularly for those records deemed not to have continuing value.

In contrast to some appraisal decision making of the past which was generally recognized to be inadequately documented, the practices of the major archival institutions have redressed this by specifying requirements for detailed appraisal justification documentation. In doing so, requirements may have swung too far and the documentation burden on those submitting appraisal recommendations have been recognized to be unduly onerous, resulting in revisions to adopt more risk-tolerant strategies and documentation. At the same time, archival institutions have themselves become more open and transparent about their appraisal decision making, through published appraisal or acquisition policies, publishing of disposal/retention schedules on Web pages and calls for public comments on disposal/retention schedules prior to their authorization.

DIGITAL RECORDKEEPING

Appraisal theory and practice has embraced requirements for digital recordkeeping by moving away from targeting specific records towards appraising functions and consequently the records (in any form) that they create. Embodying appraisal decision making into tools which formally authorize destruction will continue to be required and disposal/disposition tools are being subtly transformed to encompass changes to suit the digital environment. However, there are continuing debates about whether these are the correct tools to manage appraisal decision making into the future, with concerns about how implementable our traditional levels of appraisal decision making are in constantly changing workplaces.

The digital environment forces archival practices to change. Digital records are fragile and difficult to sustain, involving layers of technology dependence each requiring management to prevent records from being unusable and uninterpretable through technology change. Most pressing in the digital world is the requirement to ensure that robust records are made in the first place.

The Australian records continuum approach to recordkeeping has redefined appraisal to encompass the decision-making processes associated with determining what records need to be made and captured to document a business activity. "Appraisal is an analytic process which determines: (1) which records should be captured into recordkeeping systems and (2) how long such records should be maintained."^[31] This redefinition was included into the Australian Standard on Records Management, AS 4390, published in 1996, which formed the basis of the International Standard on Records Management. While the idea of proactively determining what records to capture was transferred into the International Standard, the broadening of the concept of appraisal to encompass this was not adopted.

The digital environment requires proactive involvement of archivists (recordkeepers) in appraisal decision making. The older model of leaving appraisal decision making until the record is not required for continuing business use, is unviable in the digital world where records will not survive technology change and obsolescence without active intervention. Rather, digital records require continuing intensive management in systems necessary to ensure that they will survive to serve personal, corporate, or societal memory in the form of archives.

Records continuum approaches have redefined appraisal as a continuous process, occurring at multiple sites of intervention. In this reconceptualisation, we appraise

- Transactions and the actors initiating them for whether documents should be created.
- Activities and those involved in them for how evidential the process of records capture needs to be.
- Functions in an organizational context for the place of records in the memory of the organization and its archive.
- In a broader institutional or societal context for their purpose and their place in collective memory.

Appraisal becomes an ongoing process with multiple points of specific intervention—not just about selecting "archival records," but intimately concerned with managing robust records from the time of their creation/capture within environments that will sustain them for as long as they are required. Appraisal in this view is not only the domain of the archivist operating externally to agency recordkeeping frameworks, but rather, one of a team of recordkeeping professionals operating at various points of active intervention in the existence of records, affected by social, legal, and sometimes political factors.

This view is acknowledged within Australian recordkeeping practice and supported by coherent recordkeeping guidance issued to agencies. The archival tools and techniques have yet to transform significantly to suit the digital world.

For many archives, engagement with the digital world has been slow. Dealing with a set of paper-based practices that are essentially reactive has enabled many archivists to avoid engagement with digital realities. The necessary retooling of professional practice has yet to be incorporated into many work practices. Digital repositories and the capacity to take custody of digital archives have lagged the digital library community's uptake of the challenge. Appraisal decision making for the digital world must be accompanied by robust accompanying tools such as agreed metadata standards to enable records to move between system boundaries on a continuing basis, while retaining all contextual data essential to maintaining records, rather than digital objects.

Other information professionals are engaging with discussions on appraisal. The sophistication of the engagement ranges from provocative responses of the information technology community that information storage is cheap, we should just keep everything, to sophisticated interdisciplinary approaches to address particular needs, such as research data in the higher education sphere or scientific data. For example, see "An Australian e-Research Strategy and Implementation Framework."^[32] For collaborative work in scientific data, see "Appraisal of Scientific Data."^[33] Much of the discussion is arising and being conducted in the digital preservation discipline rather than in the archival discipline. The potential uses and capacity to manipulate born digital records in new and continually evolving ways substantially challenges archival practices such as sampling of case-based material. Archivists are increasingly collaborating with other information colleagues in addressing appraisal of complex digital records and data sets. See for example, <http://www.interpares.org>;^[34] The work of the Digital Curation Centre at Glasgow University, particularly Harvey;^[35] and The collaboration between the Public Record Office and the UK Data Archive for managing UK government data sets.

The digital recordkeeping environment has also raised profound challenges for collecting archives, responsible traditionally for taking custody of material created and managed by others after their administrative or business uses have ended. The challenge of digital collecting has been taken on by some major institutions supported by digital library repositories. Recent collaborative projects, such as the "Paradigm" project, have resulted in appraisal models for digital personal papers,^[36] and the British Library "Digital Lives" project is investigating use of computers to store personal memory, aiming to devise strategies for collecting such material into the future.^[37]

CONCLUSION

Appraisal is the professional recordkeeping function of applying a conscious process to determine what "records to keep." It developed as a key archival function in the

twentieth century as a result of the overwhelming bulk of modern documentation and initially took the form of an evaluative process based on physically examining records and evaluating them against a set of criteria.

By the late twentieth century, the emergence of digital records, fluid organizational structures, and the concern that anything can be of value to someone, it became clear that existing appraisal thinking and processes were not able to be scaled up to meet demands. New thinking and experimentation in appraisal theory and methodologies emerged. Largely based upon the archival notion of provenance, these newer approaches stress the intersection of function and structure, advocate a greater acceptance of risk management and involve greater accountability in appraisal decision making. Many of these new methods have been incorporated into proactive recordkeeping standards to address recordkeeping from the time of creation for as long as the records are required.

While a ferment of appraisal thinking and experimentation has been underway, the practice of archivists is often still lagging, often remaining in the older paper-based criteria model. Appraisal has been the subject of constant professional discussion, as archivists strive towards methodologies that meet objectives, are coherent, timely and cost effective.

Archival Arrangement and Description

Joanne Evans

Sue McKemmish

Recordkeeping Innovation Pty Ltd, Sydney, New South Wales, Australia

Abstract

Arrangement and description are processes traditionally associated with the transformation of an individual or corporate archive into a broader archival framework in order for it to function, alongside other such archives, as accessible collective memory. They are integral to maintaining the authenticity, integrity, and reliability of records in an archival environment so that they may continue to function as evidence of the activities and contexts in which they were created and used. This entry outlines the principles underlying archival arrangement and description, discusses the construction of arrangement and description traditions, and explores their transformation in response to the recordkeeping challenges of the twenty-first century.

INTRODUCTION

Arrangement and description are processes traditionally associated with the documentation and processing of records into archival systems at, or near, the time of their transfer to archival institutions. Archival systems document, manage, and enable the ongoing accessibility of records of continuing value under the control of an archival institution. They have been shaped by a number of social, political, cultural, economic, and technological factors in different countries and at different times. This has given rise to different traditions for arrangement and description that reflect the nature of records, the contexts in which they are created and maintained, and the archiving contexts into which they are transferred. However, despite their differences, all archival arrangement and description practices are fundamentally a practical application of underlying archival principles of *respect des fonds*, provenance, and original order.

In the late twentieth century, the uptake of digital information and communications technologies in society in general, and in archival institutions in particular, has had a significant impact on arrangement and description practices. On the one hand, descriptive processes have been codified into various national (a selection of guides and manuals for arrangement and description produced or sponsored by national professional associations for archivists is provided at the end of the entry) and international standards (see entries on “International Standards for Archival Description,” p. 2950, and “Encoded Archival Description (EAD),” p. 1699) to enable cross-institutional sharing of archival documentation and automated processing and to assist in retrieval of archival data. On

the other hand, the fundamental change in the nature and structure of records and on business and recordkeeping processes brought about by computing technologies has exposed the practices of arrangement and description as reflective of a physical focus based strongly in the prevailing paper-based paradigm of their origin.

This entry

- Outlines the purpose and principles underlying archival arrangement and description.
- Discusses the construction of arrangement and description traditions.
- Explores how these traditions are changing to address the recordkeeping challenges of the twentieth and twenty-first centuries.

It is limited to canvassing archival practices in English-speaking countries as this reflects the experience of the authors.

ARRANGEMENT AND DESCRIPTION PRINCIPLES

The articulation of archival principles fundamental to arrangement and description arose during the nineteenth century. Their development represented a reaction to the practices employed during the previous period of consolidation of archival records in specifically designated repositories geared to serve the purposes of historical research. Those practices were intent on guiding the researcher to the most “interesting” documents typically identified by subject. The physical arrangement of the material, then, was

ordered to reflect that of the guide.^[1] In reaction to this practice, which put a subjective, imposed order on records, the principle of *respect des fonds* was articulated. Subsequently translated into the English principles of provenance and original order, these have formed the basis of all ensuing archival arrangement and descriptive practices.

***Respect des fonds*, Provenance, and Original Order**

Respect des fonds is the nineteenth-century French dictum that the authenticity and integrity of records depends, at least in part, on tracing their origin and history. To preserve records as evidence, the functional structural context of their creation must be explicitly revealed. *Respect des fonds* aims to maintain the integrity of records in relation to their documentary, provenancial, functional, and jurisdictional contexts. The *fonds* or archive is defined as

... the whole of the documents of any nature that every administrative body, every physical or corporate entity, automatically and organically accumulated by reason of its function or of its activity. (p. 40)^[2]

It has both exterior dimensions, relating to the external jurisdictional and functional structures in which records are created or accumulated, and interior dimensions, relating to its internal recordkeeping structures. The principle of *respect des fonds* is about preserving the interior and exterior dimensions of a corporate or individual archive within an archival environment so that its authenticity and integrity is maintained, allowing the records to function as part of collective memory.^[2]

In English-speaking communities, *respect des fonds* has been translated into the principles of provenance and original order. The principle of provenance is about preserving “the relationship between records and the organizations or individuals that created, accumulated, and/or maintained and used them in the conduct of personal or corporate activity” (p. 11).^[3] The principle of original order is about maintaining the ordering and grouping of records used by a creating organization or individual so that they reliably reflect the creator’s business and recordkeeping activities. Keeping records in an archival environment according to these principles maintains their authenticity, integrity, and reliability (pp. 15–16).^[4]

Table 1 gives definitions of *respect des fonds*, provenance, and original order from key publications associated with arrangement and description traditions in North America, the United Kingdom, and Australia. It illustrates that the definitions of these principles tend to be expressed in terms of their application in practice, with that practice, by and large, reflecting the physicality of paper recordkeeping environments.

Arrangement and description practices have been constructed around applying the principles in paper

Table 1 Definitions of arrangement and description principles.

<i>Respect des fonds</i>	One axiom holds that records created or accumulated by one records creator must be kept together and not intermixed with the records of other creators, often referred to as <i>respect des fonds</i> . (<i>Rules for Archival Description</i> , p. xv) <i>Respect des fonds</i> is the principle that the records created, accumulated, and/or maintained and used by an organization or individual must be kept together in their original order, if it exists or has been maintained and not be mixed or combined with the records of another individual or corporate body. (<i>Arranging and Describing Archives and Manuscripts</i> , p. 33) Respect for the principle of provenance that the archives of an agency or person are not mixed or combined with those of other agencies or people. (<i>Keeping Archives</i> , p. 479)
Principle of provenance	<i>Provenance</i> is defined as “the relationship between records and the organizations or individuals that created, accumulated, and/or maintained and used them in the conduct of personal or corporate activity.” The principle of provenance states that records should be maintained according to their origin and not “intermingled” with those of another provenance that is those created by another person or agency. They should be kept together on the basis of the organization that created, used, or accumulated the group of records and in the groupings of records the person or organization created. (<i>Arranging and Describing Archives and Manuscripts</i> , p. 15) In archival theory, the principle of provenance requires that the archives of an agency or person not be mixed or combined with the archives of another, that is, the archives are retained and documented in their functional and/or organizational context. (<i>Keeping Archives</i> , p. 476)
Principle of original order	A second axiom follows from the observance of <i>respect des fonds</i> : the way archives are described depends on their arrangement. Implicit in the archivist’s observance of <i>respect des fonds</i> is the assumption that the way a creator “automatically and organically created and/or accumulates records” will affect the way archivists arrange a fonds. (<i>Rules for Archival Description</i> , p. xv) The principle of original order involves keeping records in the order by which they were kept by the person or organization that created, accumulated, assembled, or maintained them. The groupings, file system, subdivisions, and other physical structuring provided by the records creator should be

(Continued)

(Continued)

	maintained. Keeping records in the order the creator kept them provides information about the context and use of those records. (<i>Arranging and Describing Archives and Manuscripts</i> , pp. 15–16)
	The order in which records and archives were kept in active use, that is, the order of accumulation as they were created, maintained, and used. The principle of original order requires that the original order be preserved or reconstructed unless, after detailed examination, the original order is identified as a totally haphazard accumulation making the records irretrievable (but not an odd, unorderedly, or difficult arrangement). (<i>Keeping Archives</i> , p. 475)

recordkeeping environments and also tend to be defined in terms of their application in particular traditions, as illustrated in Table 2.

ARRANGEMENT AND DESCRIPTION PRACTICES

Arrangement and description are processes traditionally associated with the transformation of an individual or corporate archive into a broader archival framework in order for it to function, alongside other such archives, as accessible collective memory. They are integral to maintaining the authenticity, integrity, and reliability of records in an archival environment so that they may continue to function as evidence of the activities and contexts in which they were created and used. As archival functions, their principal aim is to establish, capture, and sustain the physical and intellectual controls that enable an archive to be comprehensible and accessible for future use beyond the environment in which it originated.

Archival arrangement and description processes differ from other cataloging, classification, and organizing practices in that they are not seeking to impose order and structure but to reveal the inherent relationships between the records and their contexts of creation and use. The focus of arrangement and description is on explicating the relationships of records to the business and recordkeeping processes of their creators, not on classifying their subject matter or format. While cross-referencing into classification frameworks utilized in other information management traditions may be useful for accessibility, and physical arrangement based on format may be more efficient for repository management, neither one should dictate the way in which records in archival institutions are principally arranged and described. One of the potential advantages of digital and networked technologies is that

Table 2 Definitions of arrangement and description.

Arrangement	Arrangement involves analyzing the records to see who or what created them, how and why they were created, what functions and activities they document, when they were created, and what their physical nature is. (Basic RAD, http://scaa.sk.ca/rad/section1.htm) Arrangement is the process of organizing materials with respect to their provenance and original order, to protect their context, and to achieve physical and intellectual control over the materials. (<i>Arranging and Describing Archives and Manuscripts</i> , p. 11) The intellectual and physical process of putting archives and records into order in accordance with accepted archival principles, particularly those of provenance and original order. If, after detailed examination, the original order is identified as a totally haphazard accumulation making the records irretrievable (but not an odd, unorderedly, or difficult arrangement), the archivist may (after documenting this original order) impose an arrangement that presents the records objectively and facilitates their use. (<i>Keeping Archives</i> , p. 464) The intellectual and physical processes and results of analyzing and organizing documents in accordance with archival principles. (<i>ISAD(G)</i> 2nd edition, p. 10)
Description	Description is the process of explaining that arrangement so that people—researchers, administrators, whomever—who want to use the records know where to look to find the answers to their questions. Arrangement, therefore, is the process of studying the records to discover how they relate to the entities that created them. Description is the way of sharing that knowledge with everyone else. (Basic RAD, http://scaa.sk.ca/rad/section1.htm) Description is the creation of an accurate representation of a unit of archival material by the process of capturing, collating, analyzing, and organizing information that serves to identify archival material and explain the context and record system(s) that produced it. (<i>Arranging and Describing Archives and Manuscripts</i> , p. 13) The process of recording information about the nature and content of the records in archival custody. The description identifies such features as provenance, arrangement, format, and contents and presents them in a standardized form. (<i>Keeping Archives</i> , p. 467) The creation of an accurate representation of a unit of description and its component parts, if any, by capturing, analyzing, organizing, and recording information that serves to identify, manage, locate, and explain archival materials and the context and records systems which produced it. This term also describes the products of the process. (<i>ISAD(G)</i> 2nd edition, p. 10)

they may more efficiently enable such cross-referencing and inventory management without compromising archival principles.

Record Group Traditions

In the late nineteenth/early twentieth century, when archivists were mainly dealing with closed, complete, paper, records series from the records systems of relatively stable and long-lived administrations, reconstructing the physical arrangement of records in the archival repository “inherently reflect[ed] the functions, programmes, and activities of the person or institution that created them” (p. 35).^[2]

The principle of *respect des fonds* was implemented through the segregation within archival repositories of records from different creators, with the physical arrangement of these groups representing “the external structures in which each particular archive had been formed, thus also reflecting the functions and activities of the records creator” (p. 166).^[5] Internal filing structures among record series within these groupings were then also physically recreated, maintaining original order and thus also preserving the interior dimensions of the *fonds*. Once arranged, the resultant record groups were then described in archival finding aids to produce a surrogate of the “physical manifestation of the archive or *fonds* on the repository shelf.”

These arrangement and description practices reflect the recordkeeping and archiving contexts of their time, characterized by relatively stable and long-lived administrative structures, simpler and hierarchical organizational structures, and archival institutions mainly handling records of past administrations. In these circumstances, taking records into custody once they were closed, identifying the boundaries of a *fonds*, nominating a single records creator, and capturing the documentary, provenancial, functional, and jurisdictional relationships of the *fonds* through physical arrangement was relatively straightforward. This gave rise to the record group approach to description, involving the successive depiction of whole-part relationships between levels of physical arrangement.

In the record group approach, a representation of the *fonds* is captured by successive enumeration of its hierarchy from the top down, that is, the overall *fonds* is described and contextualized, followed by each of the series making up the *fonds*, and within each series the files making up the series, and (resources permitting) within each file the items making up the file. Implicit in this is the view that there are only one-to-one relationships between the levels of arrangement and their provenancial and functional contexts, and between the levels of arrangement themselves. The arrangement also preserves the filing order of the records systems, thereby representing the activities of the records creator. With the

record group approach, description takes place after arrangement, proceeds from the general to the specific, and emphasizes the importance of multilevel rules to avoid redundancy and repetition in the production of paper-based finding aids. The arrangement hierarchy implicitly captures relationships of the records to the recordkeeping contexts of the creator of the *fonds*, with physical arrangement reconstructing these relationships within the archival institution.

With the increasing complexity of recordkeeping processes and contexts throughout the twentieth century, these arrangement and description practices have been put under stress.

As the dynamics of social institutions changed, administrative structures become more volatile, organizations became larger, more complex and more variably structured, archival institutions came to be concerned with modern records (*fonds* in the process of becoming, rather than already formed in any sense), more than one records creator came to be associated with a single *fonds*, and they and any number of successor organizations might be responsible for transferring to archival custody subsets of records belonging to the same *fonds* at different points in time, archival systems based on the old rules of arrangement and description became increasingly dysfunctional as archivists struggled to solve insurmountable problems associated with scalability, defining the boundaries of the *fonds*, and creating a one-to-one relationship between a *fonds* and a records creator (p. 167).^[5]

This has given rise to alternative approaches to arrangement and description based on decoupling physical and intellectual control and viewing the *fonds* as a logical rather than a physical construct. In this approach, arrangement and descriptive processes focus on capturing multiple, virtual relationships between records, and their contexts of creation and use. Relationships in the records are virtually reconstructable rather than physically reconstructed by arrangement. Finding aids that reconstruct the *fonds* are an output from the system rather than being the unit of description. Description documents contexts rather than cataloging an arrangement. According to this approach, an archival system is in essence a register of recordkeeping systems, as well as itself being a form of recordkeeping system.

Context Control Systems

Registry systems

The recordkeeping tradition known as registration systems, or registries, was widespread throughout Northern Europe (particularly in Prussia) and the United Kingdom. It formed an important part of the control tools associated with the administration of empire, consequently spreading in the English-speaking world to Australia, Canada, and

other colonies. Registry systems, as their title suggests, center on the concept of registration and are based on the notion of controlling documentation from the time it is received by or authored within an organization. In the German recordkeeping tradition, the Registratur is “the office that controls the flow of incoming and outgoing correspondence and preserves, arranges, and services those parts of it that remain with the agency until they can be transferred to archival custody.”^[6] Documents are registered (controlled) into the system as soon as they enter the organization, or as they are dispatched, being always managed conceptually as records. A number of indexing schemes complement the registration process—typically an alphabetic name index and a topic or subject index. In the German tradition, “since the eighteenth century, there has existed a common agreement that the registry . . . must arrange its holdings in accordance with the main functions of the administrative unit it serves” (p. 91).^[6] Registry systems thereby apply archival functions to records that are still current.

Registry systems associate incoming documents with any previous transactions of relevance, in many cases physically gathering together the associated documents. The system then directs the records around the organization to those that need to take relevant action, tracking the work that is done, or needs to be done, in proto-workflow systems. The records travel through the organization gathering the documentation associated with the work as it is carried out, finally ending up once action is completed in the registry. Here, all correspondence being dispatched outside the organization is also registered in separate sequences and linked to the records related to it. The registry then stores the records of completed business in various sequences, commonly either the original sequential registration number or by any later registration number given to a subsequent document arising from action. If the latter option is adopted, sequences of records related to a business action are gathered together. These are the antecedents of the “file” that grew out of the inability to cope with the demands of registering every document in the paper explosion of the mid-twentieth century.

Registry systems separate out the physical from the intellectual, relying on multiple indexes constructed around the records to provide entry points for retrieval to serve multiple purposes. They focus on controlling documents from the moment they are received or created, with records acting as enablers and drivers of business action, sequencing activity. In paper registry practices, indelible bonds between documents and actions are created through physical markings on records, physical arrangement, and in registry control systems, for example, card indexes that also serve as retrieval tools. These practices embody the principle of original order. The physical manifestation of the record sequences can, and do, change depending on the documents brought together for action. Registry systems allow for the actual storage arrangements of the

documents to be quite separate from the constructs brought together for the actioning of work.

This recordkeeping tradition is not universal and was not the norm in twentieth-century American administration, the source of much of the first wave of office automation software. The disappearance of registries and records functions at the time of initial automation of work processes was based on the presumption that these paper-based behemoths epitomized outdated practices. Undoubtedly, understandings of the importance of records and recordkeeping were swamped by the routine undertaking of day-to-day activity in automated systems. Out-of-control, chaotic recordkeeping resulted as the old registry systems broke down and oftentimes were not replaced with any commensurate organizational systems.

With the increased application of computing technologies to the processes of document and records formation and structuring, the concepts behind many of the practices embedded in registry systems are finding new life in electronic recordkeeping best practice. Indeed, all IT systems work on registration of some kind even if it is not explicit. Simple sequential numbers as locators, rather than the bearers of embedded meaning; the development of classification systems for current records based on the work that is done in organizations, as manifested in activities and functions; the provision of multiple indexing points as aids to searching and retrieval; and workflow grouping of sequences of actions reflected in records are some examples. These characteristics are implicit or explicit in the registry systems of the nineteenth and twentieth centuries. Reworking of these concepts can be found in best practice statements for recordkeeping in the electronic world, where they can be delivered in ways attuned to automation and minimal manual intervention (see entry on “International Organization for Standardization (ISO),” p. 2917).

Series systems

In Australia, the circumstances leading to the establishment of the Commonwealth Archives Office in 1961 were quite different from those that formed the context for the establishment of national archives in Europe and the United States. In the Commonwealth of Australia (formed at federation in 1900), recordkeeping problems were essentially those presented by twentieth-century records, with all their complexity and volume. Australian recordkeeping was plagued with difficulties arising from the penchant for administrative change. Agencies were created and abolished with quite amazing regularity,^[7] and this trend increased dramatically in the second half of the twentieth century. This resulted in records series being split, merged, and resplit as functions moved through multiple agencies. The notion of documenting provenance in terms of the last creating agency was not sustainable as it could create a substantially distorted view of the provenance of the records.

The so-called Series System was developed to address these and other problems.^[8] Its designers were very conscious of requirements to maintain conceptual compliance with the core archival principles of *respect des fonds*, provenance, and original order. It also drew heavily from the recordkeeping systems in place to manage current records. To these, it added a further layer of control—a registration system for recordkeeping systems imposed by an external (archival) authority. In this system, record series are allocated a simple sequential number—a registration number that bears no inherent meaning. A separate registration process documents the records-creating agencies, with a different simple sequential number. Thus, two types of entities are independently registered and documented. They are then linked in as many ways as are relevant to each other. Using the notion of previous and subsequent relationships inherited from the earlier registration systems, each record series is linked to any and all relevant agencies. These relationships become the pivotal mechanism in allowing complex depiction of provenance in a continually cumulating archival documentation system. This approach enables representation of multiple roles in relation to records, thus documenting these roles over time and as they change. Thus, the system maintains all the traditional requirements for *respect des fonds* through enabling a very detailed representation of provenance, both at a specific point in time and over time.

The “Series” System addressed a number of problematic areas in Australian attempts to apply traditional archival description. The nexus between the physical arrangement of records in a repository and their intellectual arrangement was broken. As in a registry system managed through multiple registers and indexes, it was no longer necessary to locate the records derived from a single agency together in one place, or even all parts of a record system together. The arrangement was an intellectual construct. While agencies and records series were the two entities and aggregation layers defined by Scott and his colleagues for the purposes of archival description at the Commonwealth Archives Office, other entities and layers of aggregation can, and have been, introduced and managed in different implementations using exactly the same concepts. Multiple, layered, and complex relationships between agencies (and other entities, such as function) and records can be constructed and expressed to reflect the volatility of the administrative structures of the government. Roles and rights associated with these relationships can also be clearly delineated—for agencies, these were initially defined as “creating,” “controlling,” and “transferring” when linked to records series.

Similarly, this system is not dependent on records being in custody. The circumstances of recordkeeping in volatile administrative contexts mean that the earlier the documentation of agencies and recordkeeping systems are documented, the easier it is to get an accurate depiction.

This is ideally undertaken at the time of change of government through the management mechanisms of the machinery of government announcements (e.g., administrative arrangement orders). Documentation of recordkeeping systems can, in theory, be carried out by anyone involved in recordkeeping regardless of their designation as an archivist or records manager. Description occurs before any arrangement and can encompass all of the records—both documents and files, those extant and those that have been destroyed at various times. The system is not restricted to depicting the records held in archival custody as if they are the whole of the records. The “archieff” of Muller, Feith, and Fruin can therefore be much more faithfully represented in this system of archival documentation than in the traditional representation of a *fonds* as a catalog of surviving records.

The “Series” System implemented in the Commonwealth Archives Office was also based on pragmatism. In being pragmatic, it achieved a high adherence to the principle of original order, using the contemporary documentation of records’ creators rather than creating independent lists of records once received into archival custody. The fledgling archives could not hope to process voluminous twentieth-century records to the level of detail of calendars and many other traditional archival finding aids recommended by European antecedents. Instead, the system was based on the controls that were in place at the time the records were created. If the agency relied on the registers and indexes that they created to manage the records, so too would the archives and the archives users. Additional layers of description could be added to provide additional interpretative material where necessary, but whole-scale reprocessing need not be undertaken. With hindsight, these wholly pragmatic decisions are now a fundamental component of ensuring the authenticity of records.

All these characteristics of the “Series” System—connection to the whole of the records; the treatment of agencies and records as independent entities; documenting multiple relationships over time to maintain links between agencies and records as they change; multiple points of registration; inheritance of the records controls created to manage records in a different context—can be seen reverberating through the rich conceptual thinking embedded in the Records Continuum Model (see entry on “Records Continuum Model,” p. 4447).

DIGITAL AND NETWORKED ENVIRONMENTS

As already noted, the world of digital recordkeeping and networked environments has brought substantial challenges to traditional arrangement and descriptive practices. The complexity of modern recordkeeping, the heterogeneity of modern records, the exigencies of repository management, and the advent of computing

technologies mean that increasingly the connection between records in an individual or corporate archive and their originating context is constructed as an intellectual rather than a physical exercise. A major challenge for archivists in the face of increasing complexity and virtualization of recordkeeping with the introduction of copying, digital, and networking technologies has been to come to a greater conceptual understanding of the principles underlying arrangement and description, so that practices can be constructed to meet past, present, and future recordkeeping realities as required. In Canada, Cook and other Canadian archivists have written about the need to view the *fonds* as an intellectual rather than physical construct and of the need for arrangement and description practices to enable representation of “a dynamic interconnection between the abstract description of the records creator(s) and of the concrete description of the actual records (series, files, items)” (p. 74).^[2]

Recent definitions of arrangement emphasize that it is an analytical process, in which the records of an individual or corporate entity and their contexts are examined in order to establish by whom, how, and why they were created and used.^[9] Arrangement and description are also increasingly perceived as intertwined and interdependent functions rather than sequential activities, with interconnection to other functions such as appraisal, preservation, and access.^[4] There has been recognition of the need to capture appropriate records of arrangement and description activities, along with the notion that these processes may occur throughout the records existence rather than just at the point of archival transfer. This challenges the idea of description as merely a cataloging activity that explicates archival arrangement.

The past few decades have also seen an increasing interest in standardization of archival arrangement and description practices in order to capitalize on the capabilities of computing technologies for archival processing, access, and retrieval. This has resulted in the codification of arrangement and description practices (to varying degrees) in a number of manuals, guides, and other kinds of publications that have then been shared within communities of practice. These publications provide a set of rules for implementing arrangement and description processes that reflect the type of jurisdictional and functional arrangements, organizational structures, and recordkeeping processes of their places and times. They are also shaped and limited by available recordkeeping and archiving technologies. The International Council of Archives (ICA) has supported the development of ISAD(G), ISAAR (CPF), ISDIAH, and ISF as a suite of international archival descriptive standards, aimed at developing better understanding of arrangement and description principles in order to construct more unified practices. The ICA’s latest project, the Expert Group on Archival Description (EGAD), is seeking to develop an overarching conceptual model of archival description to

facilitate the standardization of descriptive systems and allow for the combination of descriptive information from different sources to foster collaboration among memory institutions. Such a higher-level abstract model is necessary for semantic interoperability across descriptive schemas not just within the archival community, but also with those used in library, museum, and other information systems. Conceptual descriptive models allow for common and distinctive areas to be identified, enabling the integration of description from different perspectives and sources in ways that preserve and respect meanings. However, while these kinds of standardization activities may enable greater sharing of information about archival holdings across institutions, the practices either implied or codified in the standards are mainly those relating to existing cumulated holdings of archives and reflect essentially paper-based practices. They do not address the challenges of digital and networked records and recordkeeping.

Standards for Arrangement and Description in Digital Environments

In a digital world, records do not exist as fixed artifacts. The relationships between records, once preserved by their physical ordering, can no longer be represented by physical arrangement. This provides a substantial challenge to the notion of original order as traditionally articulated and applied. All records are accessed and viewed through the mediation of a machine. What order the machine stores them in is unknown. The best that can be asserted is that the digital components of a specific record are managed within a known application. Protocols of presentation embedded in that application structure the ways the records are presented to a viewer. Records are virtual constructs—what we see on a machine in a form and format that looks familiar to a paper-based mind is only a representation of the record, rendered to appear in that given form and format. Records are brought together on the fly. They can be composed on multiple fragments and drawn from many different underlying parts of a system. Breaking traditional thinking from a physical to a virtual mindset is essential if we are to maintain the ability to present records in context to users of the future.

In a virtual world, location is irrelevant. An electronic record can live anywhere from the time it is initially created—it can live in an organization; it can be shared by multiple organizations; it can be stored by a third party; it can be lodged with an archival institution from the time it is locked into a defined format. Any of these physical locations are possible and may coexist. Thus, the archival endeavor of description is to ensure that when represented to a user (any user, at any time) the record is meaningful, able to be rendered on the technology of choice, and possesses the characteristics that make it reliable, authentic, and trustworthy.

The need for digital preservation processes to focus on capabilities to represent records is a key finding from the International Research on Permanent Authentic Records in Electronic Systems (InterPARES) Project. The project reached the conclusion that preservation of records in digital environments is about preserving the ability to reproduce records, rather than the electronic records *per se*.^[10] Reproducing records involves assembling preserved digital components into the proper arrangement to represent their intrinsic documentary form and extrinsic archival bond, essentially to maintain and render relationships to transactional contexts in order to enable the transmission of authentic, reliable records through time and space. Preservation and description functions are thus inextricably linked.

Along with the undoubted challenges of ensuring that digital records survive in readable format long enough to reach the portals of an archival institution comes awareness that reconstructing provenance and other contextual linkages for such records is unachievable when applied retrospectively. This combined set of challenges has pushed the locus of descriptive activity into recordkeeping environments more contemporary with the creation of the record. To achieve this, understandings about what descriptive processes for recordkeeping entails must be broadened out and embedded into all recordkeeping environments, commencing from the initial point of a record's capture. A corollary is the requirement to standardize these understandings in the form of professionally accepted practice (see entries on "International Standards for Archival Description," p. 2950, and "International Organization for Standardization (ISO)," p. 2917). Using such means, the locus of the application of the descriptive standards can be changed and the record can be created with many of the components required to ensure the survival of the record, connected to the business activities it documents, through time, and across multiple locations.

Moving away from description as a professional practice associated only with the work of archivists within an archival institution has required a thorough review of the purpose and nature of the work of arrangement and description. An Australian archivist, Hurley,^[11] argues that the traditional role of all archival finding aids is to maintain the linkages of records, now in archival custody, to the circumstances of their creation and management. This posits a very critical role for finding aids as a mechanism for maintaining the authenticity of records through exposition of the processes of formation of records, rather than just a presentation of explanatory material for users to facilitate access.

Reconceptualizing description as an archival function that ensures authenticity of records over time provides an immediate link back to the creating environment as there too the authentic nature of records is a key concern. The recordkeeping endeavor then becomes a shared one across multiple sites of implementation. The requirement to

define the characteristics and components that will ensure that records survive over time is an inherent part of the records-creating process. Enhancing the context of creation with other layers of descriptive information as the record moves through multiple points of creation and management, and weaving different relationships as it travels through multiple uses, reuses, and sites of interaction become components in a cumulative process of records formation.

In digital environments of increasing complexity, grounding recordkeeping theory in a strong understanding of the rationale of records becomes vital. Concepts such as cascading regions of recordkeeping actions that reflect different points in registration processes, and the primacy of relationships and notions of aggregations become essential to effective intervention in the design and development of systems to create and maintain records over time. The ability to depict complex and dynamic relationships becomes the key to maintaining records authenticity.

Recordkeeping Metadata Models

Recent international recordkeeping metadata initiatives (see entry on "International Organization for Standardization (ISO)," p. 2917) are a direct result of conceptualizing the world of recordkeeping in this way. ISO 23081 defines recordkeeping metadata as

data describing the context, content, and structure of records and their management through time. As such metadata is structured or semi-structured information that enables the creation, registration, classification, access, preservation, and disposition of records through time and within and across domains . . . metadata can be used to identify, authenticate, and contextualize records and the people, processes, and systems that create, manage, maintain, and use them and the policies that govern them.^[12]

It specifies different layers of aggregation and different sites of implementation of recordkeeping metadata in order to enable the continual construction and weaving of relationships as the record appears in multiple sequences of action. This approach is predicated on the proposition that records need to be actively defined, and that at the initial point of capture of a record object, a set of metadata about its content, structure, and immediate context of action also needs to be captured and persistently linked to it. Moreover, record objects can only exist through time if they are persistently linked to an accumulating set of metadata, providing broader layers of context, and recording the business, recordkeeping, and archiving actions that manage them. This recordkeeping metadata is itself a record and so must incorporate metadata about its "recordness," that is, who created it, when, etc.

With this view archival description is another layer of recordkeeping metadata that maintains evidential

contextualization when records are represented outside of their originating environments in transfer to an archival institution. Recordkeeping metadata about the recordkeeping metadata enables intellectual separation of that which is created by the originating and archival contexts.

Emerging metadata standards and models, including the ISO, take as their frame of reference a conceptual model of recordkeeping metadata in business and socio-legal contexts developed by the Australian SPIRT Recordkeeping Metadata Project (Fig. 1). This model extends the Australian Series System concepts of context, drawing on records continuum thinking relating to a record's complex and dynamic social, functional, organizational, procedural, and documentary contexts of creation, management, and use in and through spacetime. It is also informed by the insights of Hurley and Cook. The model defines layers of descriptive metadata about the following:

- Records at any layer of aggregation
- The people or agents involved in creating, managing, and using records
- The organizational and social structures in which they interact
- The activities and transactions in which the people or agents are engaged, and related social and business purposes and functions
- The recordkeeping functions, activities, and transactions that capture, manage, and make accessible the records of these activities and transactions
- The complex, multiple, and dynamic relationships between all of these entities
- The warrants or mandates that govern all of this social and organizational activity, including metadata about social mores, laws, business policies, and rules

Other research initiatives are also investigating requirements for recordkeeping metadata and frameworks for its

Fig. 1 Conceptual model of recordkeeping metadata in business and socio-legal contexts.

Source: From McKemmish et al.^[13]

management in electronic environments. The Clever Recordkeeping Metadata Project, involving researchers at Monash University in partnership with the National Archives of Australia, State Records Authority of NSW, and the Descriptive Standards Committee of the Australian Society of Archives, explored the automated capture and re-use of recordkeeping metadata,^[14] while the InterPARES 2 Description Research Team prototyped a Metadata Schema Registry for describing and analyzing extant metadata schemas and archival descriptive standards against emerging recordkeeping warrants.^[15]

ARCHIVAL DESCRIPTIVE SYSTEMS OF THE FUTURE

Recordkeeping metadata initiatives implemented in digital networked environments have the potent to enable simultaneous multiple views of recordkeeping realities. While most implementations of archival description document, and therefore privilege, the role of a singular records creator, representing their context rather than that of other parties to the transactions that the records evidence, and draw on functional classification schemes and thesauri developed at the level of the corporate or individual archive, the frameworks could enable alternative readings of our society, to ensure that the voices of other parties to transactions in which records are created, captured, and used are heard.

Hurley's writings have extended the conceptual basis and principles of the "Series" System to encompass the challenges of describing context and records entities and their complex, multidimensional relationships in the virtual world of the beginning of the twenty-first century. His further development of the conceptual framework for the Series System includes two layers of contextual entities, higher-level ambient entities representing organizational structures, jurisdiction-based or functional groupings, or functions themselves, corresponding to the French view of the external dimension of the *fonds*, and lower-level German-like provenance entities representing records-creating units and activities.

This extension of the Series System and emerging recordkeeping metadata models enable archivists to go beyond Peter Scott's original vision of sequential multiple provenance to address what Hurley has named parallel and multiple simultaneous provenance.^[16]

Recognising that the documentation created within the New Zealand national archives system largely reflects the cultural views of the Pakeha majority, but living in a society in which bi-culturalism is more than mere rhetoric, Hurley began to question how the views of the Maori could be accommodated in systems defined by Pakeha standards, and to seek a set of alternative, equally valid ways of viewing and documenting the records. (p. 192)^[15]

Postmodern ideas are informing the critique and refiguring of archival processes and systems. Ketelaar has also posited a different approach to archival descriptive practice with reference to the concept of "communities of records" as developed by Bastian, and associated ideas about shared ownership and joint heritage. Bastian defines a community of records as "the aggregate of records in all forms generated by multiple layers of actions and interactions between and among the people and institutions within a community."^[17] According to this view, "the records of a community become the products of a multi-tiered process of creation that begins with the individual creator but can be fully realized only within the expanse of an entire community of records"; thus, "all layers of society are participants in the making of records, and the entire community becomes the larger provenance of the records." Drawing out the implications of these conceptual approaches, Ketelaar^[18] points to the matrix of mutual rights and obligations of all the parties involved and how they would extend to all aspects of recordkeeping and archiving, including description. Archival descriptive systems of the future need the capabilities to negotiate such matrices of mutual rights and obligations and manage integrated archiving and recordkeeping processes to fulfill these multiple purposes.

Frameworks for capturing layers of rich contextual metadata, along with multiple contexts of creation, management, and use are emerging. The advent of Web 2.0 technologies has seen archival institutions experiment with adding user annotation, tagging, and transcription capabilities to their online discovery systems. While labeled as participatory archives, many would argue that more radical transformation is needed to enact more dynamic and democratic models of archival description. Huvila has identified three characteristics of a participatory archives approach, namely "decentralized curation," "radical user orientation," and "contextualization of both records and the entire archival process" and describes it as "not a complementary layer, but a primary knowledge repository about records and their contexts."^[19] In a participatory paradigm, the role of an archivist shifts from crafting descriptions to providing frameworks for creating, capturing, and connecting recordkeeping metadata, across, not just within, archival repositories. Such frameworks should also have the potential to make archival description of value and use in other information management contexts, for example, digital humanities, big data management, information governance, etc., where accountability, traceability, and authority of information, reuse, sharing, retention, and disposal are required.^[20]

Participatory archival approaches reposition what have traditionally been viewed as the subjects of records and recordkeeping processes as participatory agents with legal and moral recordkeeping rights and responsibilities.

By expanding the definition of record creators to include everyone who has contributed to a record's creative

process or been directly affected by its action, notions of co-creation and parallel or simultaneous multiple provenance reposition 'records subjects' as 'records agents'. They support a broader spectrum of rights, responsibilities, and obligations relating to the ownership, management, accessibility, and privacy of records in and through time. (p. 132)^[21]

Documenting and servicing those rights requires abandoning the concept of singular records creation, ownership, and custody that dominates extant archival description practices and standards and embracing models that enable representation of a plurality of perspectives. Furthermore, in confronting the power of records and archival frameworks to empower, disempower, harm, and protect, Gilliland has also identified an ethical platform for participatory description, based on five facets—acknowledging, respecting, enfranchising, liberating, and protecting—and with individual and community rights to name, self-identify, respond, disclose, take down, and be secure.^[22]

CONCLUSION

Arrangement and description processes, as well as the understanding of these practices, are undergoing transformation as archivists attempt to deal with records created and kept in newer information technologies, business systems, and social environments. This entry has explored the principles underlying arrangement and description processes, along with how these processes have been shaped by the recordkeeping and archiving contexts in which they are constructed. It has also outlined emerging metadata management frameworks to inform the development of the recordkeeping and archiving systems of the future.

Abstract

Archival documentation is the term used to refer to those documents that record the activities of an archival program. As the term archives has come to mean different things in different contexts, the term archival program has come into common use to represent that wide range of tasks and roles undertaken by people when endeavoring to ensure that information is preserved as evidence. This entry does not attempt to prescribe the specific forms of records that archival documentation should create, as circumstances will vary widely from jurisdiction to jurisdiction and from country to country. Rather, the entry outlines the fundamental issues and purpose of archival documentation in order to help the reader judge the adequacy of existing systems and plan for improved forms of documentation. The guiding principle of archival documentation is that it helps tell the story of the materials managed by an archival program.

INTRODUCTION

Archival documentation is the term used to refer to those documents that record the activities of an archival program. As the term archives has come to mean different things in different contexts, the term archival program has come into common use to represent that wide range of tasks and roles undertaken by people when endeavoring to ensure that information is preserved as evidence. The description and management of materials in an archive is described elsewhere (see entry on “Archival Arrangement and Description,” p. 130) and is not covered in detail here. There is an underlying assumption in this entry that the materials being managed by an archival program are created elsewhere. This could be in another place within the same organization or, as with a collecting archive, from people or organizations from the outside world. In all cases the archival program needs to create adequate records that document its activities, as these provide the essential operational framework in which the archival materials are managed.

This entry does not attempt to prescribe the specific forms of records that archival documentation should create, as circumstances will vary widely from jurisdiction to jurisdiction and from country to country. Rather, the entry outlines the fundamental issues and purpose of archival documentation in order to help the reader judge the adequacy of existing systems and plan for improved forms of documentation.

The guiding principle of archival documentation is that it helps tell the story of the materials managed by an archival program. These materials, once managed by an

archival program, are generally referred to as archives and in this sense the term refers to a body of records generated by an entity, i.e., a person, an organizational unit or some other agent, in the course of their activities. The aim of the archival program is to ensure that the materials for which it is responsible can be meaningfully interpreted by users at any time in the life of the records, from the moment of receipt into the archival program, through the period of custody and curation, and, if it eventuates, the removal of the materials from the archival program. In order to fulfill this aim archival documentation must be created that records the actions of the archival program with respect to all the materials under its control.

Archival documentation, a critical component in the capture of contextual information surrounding archival materials, is created, kept, and made available:

1. To support the effective and efficient management of an archival program.
2. To maintain the authenticity, integrity, and reliability of records under the control of the archival program.
3. To make the records under the control of an archival program accessible and meaningful to its users.

It encompasses the documentation of records within an archival program, as well as documentation of the archival program itself. Its various forms reflect the complex and heterogeneous nature of archival material, along with the physical, virtual, multi-entity, and multilayered dimensions of records, including the recordkeeping systems in which they are created, managed, and used. All archival activities—initial survey and appraisal; acquisition,

transfer of custody and ownership; preservation and conservation; arrangement and description; location management; reference, access conditions, and copyright; and public programming and outreach—are sources of archival documentation and indeed each of these functions relies on information from the others to work effectively.

Most extant archival programs are based around the handling of paper records, generally generated from paper recordkeeping systems. Archivists are facing a challenging time in determining the documentation requirements for records created and managed in digital and networked environments. Consequently, archival programs need to manage the paper/digital hybrids of the last few decades as well as new forms of “born digital” records. Practices and processes need to not only deal with the technicalities of digital records, but also the changing nature of digital and networked recordkeeping systems, and in particular the new narratives or stories that the digital technologies make possible for materials managed by archival programs.

This entry will

- Establish principles governing archival documentation.
- Detail the archival documentation associated with the different phases of a traditional archival program.
- Discuss the impact of digital and networked technologies on documentation requirements and practices.

ARCHIVAL DOCUMENTATION PRINCIPLES

To tell the story of archival materials throughout their life in an archival program, the program itself will need to establish systematic, thorough, and integrated record creation and keeping systems. The emergence, in the latter decades of the twentieth century, of digital database technologies to assist in this process has significantly altered what archival programs can achieve in this area. However, it is not effectively possible to build a computerized database system that can deal with all the variables that may need to be documented in the life of archival materials. Indeed, this is why more generalized recordkeeping systems appeared and still remain an essential part of an archival documentation system. So, it is more than likely that comprehensive archival documentation will be found in a range of systems within an archival program. It is important that these systems are interrelated and cross-reference each other in clearly articulated ways so that future archivists and users can trace and track specific information about the materials as required. The careful use of unique identifiers within archival program documentation systems will aid in the unambiguous interconnection of related information.

Archival materials are assembled and managed on the understanding that they will ultimately be used without recourse to the originating entity or indeed the people

responsible for their transfer into an archival program. It is important that specific information held only in the minds of those people is captured and systematically documented so that both the archivists of the future and those wishing to use the materials understand why the materials are where they are and why they are in the form or structure in which they have been preserved in the archive.

Although it is generally understood by archivists, it is not more commonly understood by others outside the profession that, unlike libraries (as a rule), the logical and actual arrangement of materials in an archival program is not determined by a preexisting classification system. Indeed, the description and arrangement of archival materials is predominantly determined by the actions of the entities responsible for the creation and initial purpose of the materials and the recordkeeping systems they created to manage them while they were in the first phase of their life. In accepting materials into an archival program, archivists are sensitive to the provenance of the materials, and to the relationships between materials determined by that shared provenance. Archival documentation must ensure that these relationships are preserved. Very closely aligned with that guiding principle is a respect for the actual juxtaposition of materials as determined by the filing structures, systems, and arrangement of the material at the time they are transferred to the archival program. What should emerge from an engagement with archival materials is a sense of the structure and function of the materials in that first, operational phase of their life. What should also be clear is what has happened to those materials since they entered the archival program. The hand of the archivist should not be invisible but clear and evident to all users of the materials.

The challenges facing those responsible for archival documentation are significant as each case, each new set of materials, each relationship with a transferor and indeed each user will be highly individualized and arise from its own context. Therefore, what remains fundamental to successful archival documentation is the application of consistent and well-recorded processes for handling the materials at all stages in their life.

THE PHASES OF AN ARCHIVAL PROGRAM

The main phases of an archival program involve

- Establishment of the archival program (policy, mandate, scope, governance, rights management, workplace and storage buildings, location control, digital repository systems, and documentation systems and processes).
- Entry or acceptance of materials into the program (survey, accession, mapping and registration, transfer of custody, transfer of ownership, registration of rights, and appraisal).

- Archival processing incorporating
 - Provenance identification, registration, and description.
 - Inventory identification, registration, and description.
 - Collection/series identification, registration, and description.
 - Preservation actions (type and nature of containers for physical objects, type and nature of the digital repository(ies) for digital objects).
- Location, conservation, and access management (storage locations, movements between locations, conservation actions, registration of users, and documentation of use).
- Review of holdings (reappraisal, deaccessioning).

The passage of materials through an archival program is often a discontinuous process. All phases of the program must be meticulously and carefully managed and documented so that all those involved in the various phases of the program have ready access to explicit information that documents where the materials are in the program. However, before materials can commence their journey the archival program itself has to exist.

Establishment

Setting up an archival program is a serious business and with it comes obligations to individuals and organizations that may be moral, ethical, and legal. Consequently, it is essential that there are documents that record the establishment of the program and include the following: the purpose, mandate and authority; reporting requirements; the governance framework; the collecting policy; the access policy; a statement articulating the appraisal process; the roles of the people in the program; privacy policies; copyright management processes; and where required systems that deal with legally enforced freedom of information rights.

Associated with these fundamental administrative records are the operational administrative records that deal with finance, human resources, procurement, and day-to-day management. Although they form an important element of the records of an archival program they have more in common with general administrative practice rather than archival documentation so will not be dealt with here.

However, the records that tell the story of why the archival program was established and who is responsible for its ongoing life are important for users of the records. The reasons why some records may have been kept and others not, and why records may have been documented in a particular way, may be found in the policies of the program or indeed in the policies of the mandating organization. In the contemporary era it is not uncommon for changes in operational and organizational frameworks to occur in frequent although ad hoc phases. It is important that changes in policy and operational frameworks are

clearly documented as they occur. In dealing with this sort of change over longer periods of time, it is worthwhile producing comprehensive annual reports that restate clearly the operational and policy framework under which the archival program is operating, making special note of when there are changes, what they are, and the implications for the program.

An archival program requires places for people to work and systems for the storage and preservation of the materials. The extent of the provision of these practical aspects of the program will be determined by the budget for the program and the technologies available at the time. Therefore records documenting the characteristics, design, commissioning, and upgrading of buildings including repository storage systems (physical and digital) are essential.

Allied with these records are the records dealing with the design, establishment, and commissioning of the systems to manage archival documentation. It is likely that these will evolve over time as technologies change and more productive tools become available, allowing better integration and interconnection. In an ideal world, archival documentation systems would be fully self-explaining, but the world is far from ideal so external systems documentation and explanation is necessary. It will be critical for most of these records to be kept for at least as long as the materials in the archival program exist. In other words, the plan should be to keep them indefinitely.

Entry into the Archival Program—The Survey

With the exception of the records mentioned above, the materials managed by an archival program come from outside the program. In order for the materials to become part of an archival program they must be identified and registered. The crossing of the boundary into the archival program is probably the most significant moment in the life of a record. If it survives the day-to-day rough and tumble of life in the operational zone and is kept for whatever reason, it may become a candidate for an archival program. It is not uncommon for life in the operational zone to be quite dynamic and recordkeeping systems to be highly localized and idiosyncratic. The archival program rarely has any influence over what happens in this zone but there are exceptions—it is possible that archival program requirements can influence the identification, management, and appraisal of key records, for example, records of governance, minutes of boards, and similar materials. However, once the archival program boundary has been crossed things need to change dramatically for the record.

Although it is accepted that the ability to interpret archival materials requires knowledge of the context of their life in the operational zone, the best that the archival program can usually achieve is a snapshot of how they were positioned at the time they crossed the archival program boundary. To prepare for this transition an initial survey of the

materials in situ needs to be undertaken. New digital documentary tools such as digital cameras, sound recorders, and video recorders can bring significant productivity gains to this process. Archival program management systems should allow for the systematic integration of these items into the documentation process. This will assist in enabling the traceability of the items from this context-as-found through to their preservation location within the archive. Images of materials on shelves, in offices, with the people who use them, or even in garages after years of neglect help capture their story in ways not possible when only using words. Interviews with staff, family, and others associated with the materials, especially stories around the people and circumstances of the projects and activities associated with the materials, can be invaluable.

Transfer and Accessioning

The accession, or the formal registration of the materials as found, is the traditional entry point for records into an archival program. As a rule, the formal custody arrangements of the materials will change during this aspect of the archival program. Therefore, appropriate instruments documenting, authorizing these changes, and articulating the terms of transfer should be utilized. In some cases an exchange of letters may be sufficient, whereas in other cases, forms and other legal documents may be appropriate. For many materials the accession registration may be the first concrete anchor point where their story is documented. The systematic collection of data about the materials at this point is critical. Meticulous attention to detail in process and description is an imperative. For example, data that documents terms and conditions of ownership and custody, date of registration, location of registration, detailed information about the transferee, storage unit labeling, description of contents, notes about the condition of the materials and thoughts about future processing issues, and the provenance of the materials are critical elements of the archival documentation of this process.

The ability to produce a range of accession reports that reproduce the information gathered during the accession process can be most useful. These should be made available to all authorized stakeholders as evidence of the work undertaken and the condition or state of the records on entry into the archival program. All stakeholders should have the opportunity to contribute knowledge to the archival program. This point in the process provides an important opportunity to assess the descriptions of the materials, identify records where there may be ambiguities of interpretation, and check the allocation of key terms and other forms of controlled classification. Each accession or transfer should be allocated a unique identifier within the registration system.

During the accession process information can be gathered about how the incoming material relates to material

already managed by the archival program. Is the new material an addition to an existing series or collection or is it something completely new? Documentation that captures this information and analyses it in a systematic way will help with the eventual description, management, and use of the materials. The funding of archival programs is known to be problematic. As a result there can be significant gaps in time between the accession registration and further archival processing or documentation. These gaps are sometimes measured in decades. Indeed, there are archival programs that undertake no further archival processing and use their accession registers as their primary form of control and access.

An accession once registered, consistently documented, and housed in uniquely identified containers, can be responsibly relocated into appropriate storage without comprising the integrity of the records and minimizing the risk of materials going missing. The systematic documentation of the sequence of any new locations is therefore a new requirement of the archival program. The completion of this phase is only the beginning of the archival program but if this phase is undertaken in a painstaking and careful manner, the following phases, rather than being problematic, can be responsibly and efficiently managed.

Once in the Archival Program—Description, Housing, and Management

Once formally established within an archival program subsequent archival processes which require documentation include more detailed identification of materials, the registration and description of entities associated with provenance, the identification and registration of collections, series, record groups, box lists, and inventory items. Again, the allocation of unique identifiers to each of these entities will enable the systematic interlinking of elements of the documentation systems.

The selection of the levels and elements at which an archival program chooses to arrange and describe the materials varies from archival program to archival program. The issues surrounding arrangement and description are covered elsewhere and are therefore not covered here. Most importantly, what is required is clear documentation of the processes, practices, and protocols used by the archival program. There is no right answer or indeed correct arrangement of archival materials but what must be evident to the user are the actions taken by archives staff in preparing the materials for use.

The International Council on Archives has prepared standards that describe the elements of description that should be gathered as part of archival documentation at this phase of an archival program: ISAD(G)—the International Standard for Archival Description (General) and ISAAR(CPF)—the International Standard for Archival Authority Records (Corporations, Persons and Families).

Some countries have developed more detailed local rules for archival documentation during this phase of the archival program and these should be consulted as necessary.

Appraisal—It Happens All the Time

Of all the traditional archival functions, appraisal and the selection of materials for long-term retention is probably one of the most difficult to systematize and therefore document. Appraisal and selection is a process that can and is often undertaken in all phases in the life of materials and is an essential function of the archival program. From the initial survey to the review of materials based on use and changing values, appraisal and selection can be invoked. This may lead to either the noninclusion of materials or the removal of materials from an archival program. The appraisal of materials can also include the identification of any sensitivity associated with the materials due to personal, cultural, or legal circumstances. Archival materials are rarely the province of just one stakeholder, so it is necessary that these issues are identified and clearly documented, even if these sensitivities and resultant restrictions on use remain uncertain. The clear and unequivocal documentation of these actions and processes wherever undertaken is critical.

Uses of Archival Materials—The Role of Feedback

Archival programs may produce a range of guides, finding aids, online databases, and other documentary instruments that enable users to locate, request, and utilize the materials managed by the archival program. These are all important elements of the framework of archival documentation. However, these public instruments generally do not reveal all the information pertinent to the story of the materials, some of which may not be suitable, for privacy or other reasons of sensitivity, for the general public. As a rule access to archival materials, even those that do not have access restrictions, requires users to register with the archival program and agree to abide by a set of local rules. These rules may cover such things as copyright and moral rights obligations. In an ideal setting all the information resulting from this user documentation and any other feedback or additional information the users might provide about the materials they are viewing should be systematically incorporated into the descriptive documentation of the materials. If well done this could be used to enrich guides and finding aids, identify communities of users and aid in appraisal reviews.

IMPACTS OF DIGITAL AND NETWORKED TECHNOLOGIES

From the use of digital capture documentation tools such as cameras, and video and sound recorders in the archival

survey and accession process, to the use of imaging and digitization technologies of the materials themselves for enhanced access, security, and preservation, these technologies are not only transforming archival practice but also reconfiguring archival documentation.

The impact of digital and networked technologies on archival programs has been profound and seems likely to continue to drive significant transformation. Not only are most materials destined for archival programs now produced in the first instance in digital forms but there is increasing pressure to radically increase the rate of digitization of analogue materials. However, this is just the beginning of the data revolution facing archives programs. Further manifestations of digitized archival materials where content is extracted and marked up, for example in XML schemas, are being created and these new records must also be documented and integrated into the archival program.

The advent of sophisticated digital repository systems makes possible the effective archival preservation of digital materials. These systems rely extensively on the use of unique identifiers to manage digital objects as well as the related metadata elements required for management and preservation. Digital preservation is a vast topic that is covered elsewhere but there a few points worth reiterating, especially the use of nonproprietary formats, the ability to store the objects on a range of media, the automated checking of integrity and the management of file type migration to enable use through time and changing technologies.

Therefore, it is critical that system description and documentation is well maintained and that data disaster recovery processes are regularly tested. Like the storage and location management systems for paper materials, these systems form only part of a full archival program. The challenge for the archivist is to ensure that all components remain integrated.

Digital systems are becoming increasingly interconnected via the World Wide Web and its underlying services. It is an area that is still to be fully explored by archivists but users are driving the need for better interconnection and cross-referencing of the materials managed by different archival programs. This will add yet another dimension to the archival documentation matrix. The quality and the information architectures utilized by archival programs in their documentation systems will determine how quickly and efficiently these frameworks of connectivity may emerge.

However, despite the challenges posed by rapid technological change, archival programs are shaped by the needs of the human beings and their relationships with archival materials—as the creators of records, the subjects of records, and as the users of records. It is this ongoing narrative, this interplay between people and the evidence of their world, and the stories that make their lives meaningful, that lay the foundations for archival documentation. Archival documentation is driven by epistemological,

ethical, and practical imperatives that can all be traced back to the telling of the story of records. Without the stories of the records the stories in the records become increasing difficult for future users to decode.

SUMMARY

Archival documentation involves

1. Records of establishment, including governance, policies, reporting, and administration with a focus on capturing change in these parameters over time.
2. Records of archival systems, including the design, building, and commissioning of archival record-keeping systems (including both database and other systems) and the way they are interconnected and integrated, e.g., contact files/database, collection files/database, accession registers, consignment forms, and disposal records.
3. Records of survey and transfer, including making contact, surveying, appraising, consigning, accessing, physical and custodial transfer, in other words formal registration in the archival program.
4. Records of rights, sensitivities, and access conditions.
5. Records of arrangement and description including further appraisal and assessment, structural analysis, identification of related materials, and processing tasks.
6. Records of location, preservation, and conservation.
7. Records of access and use, including the guides, finding aids and user interfaces to archival documentation; the registration of users and their usage (including publications); annotation, qualification, addition of new information; and management access for restricted or sensitive material.
8. Records of the interconnections and cross-references with other archival programs.

Archival Finding Aids

Su Kim Chung
Karla Irwin

University Libraries, University of Nevada—Las Vegas, Las Vegas, Nevada, U.S.A.

Abstract

Archival finding aids serve as the primary means by which users can obtain intellectual access to collections of primary source materials be they archives or manuscripts. Although the term may reference the general guide to a repository's collections as a whole, it is more commonly thought of as the guide to an individual collection within a repository. In addition to describing the physical contents of an archival collection, the finding aid comprises other identifying, contextual, and administrative information about the materials. The online environment has led to significant changes in the archival finding aid in the past decade with the development of the encoded archival description, *Describing Archives: A Content Standard*, archival collection management systems, links to digital content, and the addition of Web 2.0 features that seek to add interactive qualities to online finding aids. The future is certain to see continued development and refinement of the finding aid as more materials are born digital or are digitized and ways are developed to describe them in the context of a user-friendly finding aid.

INTRODUCTION

In its broadest conception, the archival finding aid can be considered as any type of descriptive tool that provides intellectual access to the materials held in an archival or manuscript repository on a collective or individual level. Thus, this definition holds that a summary guide to the various record groups and/or collections held in a repository or a document providing box, folder, or item-level description to an individual collection in that repository are both considered finding aids. Whether “published or unpublished, manual or electronic,” its purpose is “to establish physical and/or intellectual control over records and/or archival materials”^[1] and serve as the means by which users “gain access to and understand the materials.”^[2]

Although the finding aid can take a variety of formats and is referred to by various names, including inventories, calendars, registers, guides, and container lists, it is generally thought of by most archival practitioners as the primary descriptive tool by which they and users can access materials in an individual archival or manuscript collection. Thus, this entry will focus on the finding aid primarily in its function as an access tool to an individual collection. It will provide a brief introduction to the archival finding aid by considering its function, structure, and content, and efforts at standardization that have evolved with the presentation of finding aids in the online environment. The entry will also discuss recent developments that may affect the creation and presentation of finding aids in the future. Suggestions for further resources in which to find more detailed information and examples of finding aids can be found at the end of the entry.

DEFINING THE ARCHIVAL FINDING AID

Whether a guide that focuses broadly on the totality of records or manuscripts in a repository, or a document that describes an individual collection within that repository, the finding aid is the central means of access and description for archival or manuscript materials. In this manner, it serves much the same function as an index or table of contents does in a book. Thus, it reflects the intellectual and physical organization of a collection and provides descriptive information on these materials at a collection, series, folder, or item level. The level of description and organization reflected in a finding aid can vary and depends on the collection, the processor, and the policies of an institution.

Although they serve much the same purpose, archival finding aids have in the past been referred to by different names depending on whether they were found in an archives or a manuscript repository. In the former, they were traditionally called inventories, while in the latter, they were known as registers. Calendars, a name typically reserved for the most lengthy, detailed finding aids created to list documents at an item level, are more likely to be found in a manuscripts repository where such detail may be helpful for particular formats of personal papers such as correspondence. This difference became less of a concern in recent years, as noted by O'Toole, with the move toward standardization of archival description in the late 1970s. According to O'Toole, “archivists acknowledged this to be a distinction without a difference, since all repositories wanted to know and record the same things about their collections in the effort to understand them and make them usable.”^[3] Specifically, he credits the

publication *Inventories and Registers: A Handbook of Techniques and Examples* as the work that demonstrated “graphically how much alike the supposedly different approaches were.”^[4]

ARRANGEMENT AND DESCRIPTION IN THE FINDING AID

Whatever its nomenclature, the finding aid can only be created after the essential business of arrangement and description of materials, be they archives or manuscripts, has taken place. Thus, most guides to arranging and describing archives and manuscripts^[5–7] consider the finding aid embodies the concept of archival description. During the physical processing of a collection, for instance, as the archivist rehouses and arranges the archival material at hand, he or she takes notes and focuses on what information will eventually need to be placed in the finding aid in order to make both the content and context of the collection clear to users.

The archivist’s decisions about how the materials in a collection will be intellectually and physically arranged are also reflected in the finding aid. In fact, before any work is done on the organization of individual items or folders, the archivist must determine the appropriate level of arrangement for the collection as a whole. This arrangement may be at a record group, series, or subseries level depending on the type of materials being processed. Although rare, the correspondence or diaries of a notable person may be described at an item level while it is more likely that the records of an institution or organization may only be described at the series or box level. Following the concept of original order (*respect des fonds*), some materials, such as the archives of an organization or business, should retain something of the natural record group or series arrangement they had as functioning records in a working business or organizational environment; they can then be easily arranged in series and subseries due to the fact that their previous functions are easy to discern.

Other materials such as personal papers and manuscripts, however, may lack any type of obvious arrangement. As a result, the archivist will generally create the arrangement for personal papers during the course of processing by grouping them into series and sometimes subseries based on elements such as formats, time periods or the roles, occupations or interests of the person whose papers are being processed. The series and subseries arrangement provides the necessary hierarchical structure for the physical and intellectual organization of the materials that will then be conveyed in the description presented in the finding aid.

Beyond the larger concepts of arrangement, finding aids, as guides to individual collections of records or papers, typically consist of a number of both administrative and descriptive elements designed to provide

intellectual and physical control over the materials being described. Additional descriptive elements typically included in an archival finding aid serve as a means to provide contextual information such as size, date span, access restrictions, and organizational or individual history. Such information forms part of what Miller^[5] described in 1990 as an “archival description system” that should be included in the creation of all finding aids. This system consists of various elements: information *about* the records and their creators, their intellectual content, use of the records including access and relationships to other records, physical characteristics, and gaining access to the records.

Some 15 years later, Roe’s^[7] version of these necessary elements is somewhat similar but with differences that reflect the development of the encoded archival description (EAD) standard for the structuring of finding aid content. She describes the elements needed for archival description within the finding aid as comprised of the following: core identifying information, contextual information, physical characteristics, administrative information needed to support use, informational content, and access/index points. Whatever these subtle differences, however, the elements described by Miller and Roe both comprise the descriptive information that a finding aid *should* ideally contain even if the structure and presentation of these elements may differ in terms of the detail and scope decided on by the archivist (processor) or the policies dictated by the archival repository.

Within these general categories of descriptive information are the detailed elements that will form part of the finding aid. For instance, the core identifying information may contain details such as the title, dates, and quantity. Contextual information consists of the biographical sketch of an individual or the administrative history of an organization or business. The section on physical characteristics may contain details on the quantity/extent of records and the actual organization and arrangement of the collection. Administrative information regarding use may describe any restrictions or copyright issues that apply to the records. Finally, there is the heart of the collection—the series, folder, or even item-level listing that describes the content of the collection at the highest level of detail.

CREATING THE FINDING AID

Once the archivist has compiled this information, he/she transforms it into the finding aid. Structurally, a finding aid is divided into two parts—the front matter and the container list. In combination, the two parts illustrate the arrangement and description of the collection of records, archives, or manuscript material as described earlier. The front matter contains the identifying, contextual, administrative, and physical information about the collection, while the container list is comprised of the content—the

listing of all box and/or folder (sometimes item) titles in the collection. See Fig. 1 for a sample finding aid that follows this format.

For finding aids that describe materials that are particularly rich in content, such as literary manuscripts, diaries, correspondence, photographs, or maps, some archivists may choose to include an item-level inventory in the

container listing. Typically, because of the extra effort and resources needed to create finding aids at this level of detail, archivists only produce item-level description when it is anticipated that a collection will be used heavily.

Until the advent of word processing software, finding aids were usually created on typewriters and the resulting print copies were only available within, or by user request

Collection Name: Desert Breeze Hotel Casino Collection
Collection Number: MS 105
Creator: Desert Breeze Hotel
Extent: 5 linear feet, (5 boxes)
Dates: 1948-1979 (bulk 1955-1965)
Prepared by: Cecilia Sinatra, 1990

Organizational History

The Desert Breeze Hotel Casino opened in 1949 on the Las Vegas Strip. For thirty years it was located on Las Vegas Boulevard just north of the legendary Flamingo Hotel Casino resort. The hotel was built in what was a cutting-edge design at the time and is now referred to as mid-century modern design. It was known for its lush landscaping and the many ponds and waterfalls that dotted the property. The Desert Breeze was also renowned for the top caliber of entertainment it featured in its showrooms and for its famous line of chorus girls – the Breezettes. Prominent singers from the opera and jazz worlds as well as Hollywood singing stars graced its stages frequently as did vaudeville performers and comedians.

A scandal befell the hotel in 1965 when it was found that individuals connected with organized crime in New York City had been skimming the casino profits for millions of dollars over a period of five years.

Despite the bad press, the Desert Breeze bounced back and was still regarded as one of the top hotels in Vegas in the early 1970s. After many successful years, however, the Desert Breeze Hotel began to fall into disrepair in the late 1970s. In 1979, the Desert Breeze Hotel Casino was sold by its owners and imploded to make way for the Tropical Sands Hotel Casino Resort.

Scope and Content

The Desert Breeze Hotel Casino Collection is comprised solely of materials from the public relations department of the hotel. The materials document the hotel's efforts at promoting itself within the Las Vegas community and nationwide. The public relations department was charged with initiating publicity stunts in order to promote the hotel and with advertising the casino in a variety of media including print, radio, and television. The collection includes correspondence from the head of the public relations department to a variety of newspapers and public relations figures across the country as well as press releases and press clippings on the hotel. Scrapbooks created by the public relations are also included in the collection.

Arrangement

The collection is arranged into two series:

- I. Correspondence, 1948-1978
- II. Publicity, 1948-1979.

Series I: Correspondence

Extent: 2 linear feet, (2 boxes)

Date: 1948-1978

Scope and Content

This series is comprised of correspondence from the public relations department of the Desert Breeze Casino. The majority of correspondence is from the head of the Desert Breeze Hotel public relations department, Sid Smith, who worked in this capacity from 1948-1972. The remaining correspondence is from various individuals who worked in the Public Relations department after Smith's departure. It also contains Christmas cards from various celebrities and entertainers who either stayed at the hotel or performed in the showroom.

Arrangement

Material is arranged chronologically.

<u>Box</u>	<u>Folder</u>	<u>Contents</u>
1	1	Incoming Correspondence, 1948-1960
	2	Outgoing Correspondence, 1948-1960
	3	Incoming Correspondence, 1960-1975
	4	Outgoing Correspondence, 1960-1970
	5	Incoming Correspondence, 1975-1978
2	1	Christmas Cards, 1948-1955
	2	Christmas Cards, 1956-1960
	3	Christmas Cards, 1961-1965
	4	Christmas Cards, 1966-1975

Fig. 1 Sample finding aid (fictional collection).

Series II: Publicity**Extent:** 3 linear feet, (3 boxes)**Date:** 1948-1979**Scope and Content**

This series is comprised of materials generated by the public relations department of the Desert Breeze Hotel Casino and articles clipped from local and national newspapers.

Arrangement

The series is arranged according to format: press clippings, press releases and scrapbooks.

<u>Box</u>	<u>Folder</u>	<u>Contents</u>
3	1	Press clippings: local, 1948-1960
	2	Press clippings: local, 1965-1975
	3	Press clippings: national, 1948-1960
	4	Press clippings: national, 1961-1975

Fig. 1 (Continued).

from, the repository in which they were created. Initially, only those institutions with the resources and staff to produce published versions of their finding aids were able to see them in wider circulation as these versions could be purchased by other individuals or libraries. In 1983, the development of the *National Inventory of Documentary Sources in the United States (NIDS-US)*, a compilation of finding aids on microfiche (and later CD-ROM) for collections located at the Library of Congress, federal and state repositories, and select historical societies and academic libraries, did provide a wider degree of access to some finding aids. Even then, however, this access was limited to those who had access to a library that held *NIDS-US*.^[8] Fortunately, this situation has changed dramatically as a result of the Internet and the development of the EAD standard for the encoding of finding aids. Archival and manuscript repositories throughout the United States and the world now regularly place their finding aids online, providing a greater degree of access for a much wider range of users than was previously possible.

Developing Archival Standards for Finding Aids

Prior to EAD standardization, efforts in the archives community were centered around efforts to make the *summary descriptions* of collections available through the national bibliographic utilities (at the time the Online Computer Computer Library Center, Inc. and the Research Libraries Group) that had enabled libraries to make the existence and location of published works known—first in print catalogs and then over networked computing systems. In adapting the MARC standard for archival materials (through the work of the National Information Systems Taskforce of

the Society of American Archivists), the USMARC Archival and Manuscripts Control (MARC AMC) format was created as a means to make it possible for archives and manuscripts to share summary descriptions of individual collections within their repositories in bibliographic catalogs. As Pitti^[9] has noted, however, MARC AMC was a content encoding standard only and not a standard for the content of the records themselves. Only with the publication of the *Archives, Personal Papers, and Manuscripts (APPM)* cataloging rules by Steven L. Hensen in 1983 (revised in 1989) were archive and manuscript repositories able to fully utilize the MARC AMC format and create catalog records of their individual collections to place into the national bibliographic utilities.

Although this was a giant step in the direction of providing greater access to archival materials at the collection level, the development of EAD brought this access to the next level by providing the means to place complete finding aids online. Although early computer applications such as SPINDEX I, II, and III (1960s–1970s) had provided greater access to collections by enabling the automation of finding aids, they did not have the delivery mechanism of the online environment.^[2] The EAD standard addressed the structure of a finding aid and enabled a visual representation in the online environment that would reflect the hierarchical organization and structure of the finding aid. Developed by Daniel Pitti and a committee of other archival description experts in 1995–1996, EAD is a data content standard that enables users to markup (encode) the contents of a finding aid using the Extensible Markup Language (XML) standard, thus providing a structure for describing an entire collection and its various components. Tags surrounding different elements (such as

the scope and content note, biography, or organizational history or related materials) in a finding aid encoded using EAD enable the contents of a finding aid to be searched at various hierarchical levels of description from the broadest collection level to the more granular series, subseries, or folder level. Beyond the individual finding aid, however, EAD tags also enable searching on a larger scale within union catalogs of finding aids or in a potential federated search of multiple finding aids systems.

Although finding aids have traditionally varied in style across repositories, the structural requirements of EAD have encouraged the existence of more standardized finding aid content and presentation in many repositories. EAD has been widely adopted in the archival community and has become a true international standard.^[10] However, adoption is still unattainable for some and despite the increased access afforded by EAD barriers to implementation still remain. These range from a lack of staff, resources, and technology expertise to a concern with revising existing finding aids to fit EAD structures to questioning its propriety as a standard or how it might fit in within a repository (see for example: Tatem,^[11] Meissner,^[12] Roth,^[13] Marshall,^[14] Yakel and Kim,^[15] and Yaco.^[16])

EAD/XML editing software such as Archivists' Toolkit, Archon, and, most recently, ArchivesSpace have removed some barriers by minimizing the time and expertise needed to convert older finding aids and place EAD encoded finding aids online. Archon and ArchivesSpace provide all-in-one software that can be utilized to encode finding aids and output them in several formats such as HTML, XML, or PDF.^[17]

ArchivesSpace is also being designed to support another recent XML encoded standard: Encoded Archival Context for Corporate Bodies, Persons, and Families (EAC-CPF). Adopted by the Society of American Archivists in 2001 and maintained with the Berlin State Library, the EAC-CPF standard is a means to improve creator description. EAC-CPF supports linkages between creators (agents) to show the relationship among record-creating bodies with additional links to record description and other related entities. According to Weimer, EAC-CPF will "eliminate the need for redundant administrative/biographical information in various finding aids; enable the linking of access by creator to records within a single repository, or across multiple repositories; and ease the maintenance of variant and related names."^[18] Users gain a better understanding of records through information about the context of how agents created and used the material.^[19] The number of EAC-CPF implementers is set to grow in the coming years with increased education and training on the subject, but use thus far is modest. Only 5% of respondents in a recent survey claim use of the standard at their repository.^[20]

Another standard that had a significant effect on finding aids occurred with the release of *Describing Archives: A*

Content Standard (DACS). Whereas EAD was created to reflect and standardize the hierarchical *structure* of a finding aid, DACS serves as a standard for describing both archival catalog records and finding aid content. Following both internal SAA committee reviews and input from the archival community, it was officially approved by the Society of American Archivists as an SAA standard in 2004.

DACS superseded the APPM standard, while also supplementing and extending the skeletal rules of description found in Chapter 4 of the *Anglo-American Cataloging Rules* (AACR2). Its rules for describing archival content are compatible with both the EAD and MARC formats. It also serves as the US implementation of international descriptive standards (primarily ISAD(G) and ISAAR (CPF)). What is significant about DACS with regard to finding aids is that it allows for the description of archival and manuscript material at any level of description from the collection to the item level, leaving behind the bibliographic approach that was inherent in AACR2 and followed to some degree in APPM. In 2013, SAA released the second edition of DACS with the intent of harmonizing its rules to the standards of ICA, ISAD, and Resource, Description, and Access (RDA) framework.^[10] RDA was published in 2012 as the primary standard for bibliographic description in libraries, replacing AACR2.^[21]

Current and Future Finding Aid Developments

With more and more repositories using EAD as the means to present their finding aids online, there has been a corresponding increase in the concern over the usability of these archival finding aids in the online environment. In addition, with online finding aids reaching a more varied audience unfamiliar with the function and structure of these guides, archivists have realized the need to develop a greater awareness of these elements as they design finding aids for the online environment. Thus, both user studies and usability testing of online finding aids have increased. Archival journals such as the *American Archivist*, *Archival Issues*, and the *Journal of Archival Organization* have all featured case studies on the usability tests carried out by various repositories in different stages of implementing EAD (see for example: Roth,^[13] Prom,^[22] Yakel,^[23] Coats,^[24] and Daines and Nimer^[25]). Conclusions are varied, but all suggest the need to pay closer attention to issues of terminology, navigation, display, and structure. In particular, there has been criticism about the simple transfer of the print finding aid into the web environment with little consideration of how this structure should be adjusted, either cosmetically or structurally, to take advantage of the features offered by the online environment. User expectation of finding aids and ease of navigation is also a concern.

The continued development of online finding aids is also making possible other innovations such as the linking

of digital objects representing selected collection materials to their description in the finding aid. Light and Hyry emphasize the potential of enriching online finding aids with web-based annotations, suggesting that this enhanced description could promote discovery by augmenting existing access or by offering alternative descriptive language for researchers. In this enriched form, they argue, the finding aid could truly become “the center for the accumulation of knowledge about a collection, instead of residing in the experience and knowledge of seasoned reference archivists.”^[26] Speaking from a postmodern perspective, Light and Hyry (2002) also advocate for placing colophons in finding aids as a means to inform researchers about the (processing) archivist’s role in representing and interpreting a collection—a means to acknowledge his/her editorial contribution and “acknowledge our mediating role in shaping the historical record.”^[27] It appears adoption of Light and Hyry’s suggestion has been minimal thus far. In a 2014 survey, a low percentage of respondents answered “yes” to whether or not they included commentary and annotations to their institution’s finding aids, expressing concern with time required to address feedback and changes, as well the quality of user feedback.^[28,29]

Recently, as user-generated content on the web (blogs, RSS feeds, user feedback, podcasts, and wikis) has become more pervasive, some archives have begun to look at these technologies as a means to transform their online finding aids and provide them with these more interactive qualities. The “Next Generation Finding Aids” project at the University of Michigan’s School of Information that began in 2005 is one prominent example; in seeking to expand the capability of EAD, its goals have been to use these Web 2.0 technologies (collaborative filtering and social navigation mechanisms in this case) to “challenge the traditional finding aid structure” by making the archival and research experience “collaborative and participatory.”^[30,31] Calisphere by the California Digital Library is an accessible interface for K-12 audiences and an example of the relationship between online finding aids and images.^[32,33] With archival repositories continually looking for ways to make their websites and finding aids responsive to user needs, research continues into the means by which Web 2.0 can enrich and transform the capabilities of online finding aids.

Another development in the archival world that has affected the creation of finding aids is the 2005 Greene–Meisner study, which addresses a problem common to many archival repositories: the existence of large processing backlogs. The study suggests a number of physical and intellectual methods for the minimal processing and description of archival collections that can reduce processing times and the subsequent creation of finding aids. While acknowledging the critical importance of archival description, Greene and Meisner’s rubric, succinctly expressed as “More Product, Less Process,” acknowledges the critical importance of archival

description while arguing that “it needn’t be long-winded, laborious or minutely detailed to be effective.”^[34] To this end, they suggest that not all collections require the same level of description, and that even within collections the same level of description may not be needed for every series. Archival repositories are implementing some or all of these guidelines in processing their collections (see for example: McCrea,^[35] Weideman,^[36] and Meisner and Greene^[37]). Even DACS offers guidelines on the description of minimally described collections in the form of “minimum” requirements as opposed to “optimum.”^[38]

CONCLUSION

The archival finding aid, as the primary means by which users obtain intellectual access to collections of primary source materials, plays an essential role in a researcher’s information-seeking behavior within an archives or manuscripts repository. Although the term may reference the general guide to a repository’s collections as a whole, it is more commonly thought of as the guide to an individual collection within a repository. In addition to describing the physical contents of an archival collection, the finding aid is comprised of other identifying, contextual, and administrative information about the materials. The online environment has led to significant changes in the archival finding aid with the development of the EAD and DACS descriptive standards, links to digital content, archival collection management systems, and the potential addition of Web 2.0 features that seek to add interactive qualities to online finding aids. The future is certain to see continued development and refinement of the finding aid as more materials are born digital or are digitized and ways are developed to describe them in the context of a user-friendly finding aid. Ultimately, however, the task of the finding aid, whether in the print or online environment, is to provide adequate access and information on archival collections, and it is important not to lose sight of that fact in the face of whatever advantages technology may provide in the future.

Archival Management and Administration

Michael J. Kurtz

Abstract

This entry provides a detailed overview of the key elements involved in managing archival institutions in the twenty-first century. Focus is on effective leadership exercised in the paradigm of organizational complexity and relationships. Core management functions of organizing work; planning; and managing financial and human resources are described in the context of dramatic societal change and the unique role which archives fulfill in society. The transformative role of information technology in revolutionizing archival work processes and providing access to potentially unlimited numbers of users forms a key underpinning of contemporary archival management.

INTRODUCTION

Archival institutions in the first years of the twenty-first century are in the midst of a profound transformation. The revolution in information technology and the advent of the digital era have challenged traditional concepts of how records are created and used; how archives manage and preserve their collections; and, most importantly, provide access. Access to records and archives is a hallmark of a democratic society. Thus, whether in the public or private sectors the demand for transparency and accountability has a dramatic impact on the management of archival institutions.

Archival institutions in most instances face stiff competition in obtaining needed recognition and resources. In the era of Web and online access the continued relevance of amassing collections and managing them in the traditional manner is under continual challenge. Archival managers are faced with a workplace in transition. New technologies, new work processes, and a diverse and demanding workforce pose particular challenges for archival managers.

Though there are professional and management issues specifically relevant to the archival setting, at its heart, management as Mary Parker Follett, an early twentieth century management theorist, put it, “is the art of getting things done through other people.”^[1] This succinctly captures the essence of management work. Managers must lead in organizing work and aiding workers in being productive. From the perspective of management guru Peter Drucker, management is the key organ of any institution, responsible for the performance and survival of the organization.^[2]

Management is basically about people, what they do, and the organizations in which they work. From this perspective, archives are like any other organization. The basic management tasks of judiciously applying available

resources (i.e., money, people, space, technology, and equipment) to mission-related work are carried out in a variety of organizational frameworks and settings.

This entry presents a management paradigm, organizational complexity, as a particularly useful method to understand the web of relationships—personal, professional, and organizational—around which the work of complex modern organizations revolves.^[3] Though many archival organizations may be relatively small in size, almost all are located in larger, hierarchical organizations such as libraries, museums, historical societies, and at all levels of government. In addition to purely internal relationships all archival entities are constantly involved in a web of complex external relationships including resource allocators, donors, stakeholders, customers, the media, and oversight bodies.

Administrators who seek to succeed in leading archival institutions must be able to understand the complex systems and subsystems that undergird all organizations. Mastery of organizational complexity enables the administrator to lead, organize work, manage resources, and communicate in a variety of forums essential to achieving the mission of the archives. Archival management, as is management in any other setting, is complicated and often confusing without a clear foundation in theory as well as practice.

MANAGEMENT THEORY AND PRACTICE

Modern management theory is principally derived from the world of business and industry. Beginning with the Industrial Revolution in the mid-nineteenth century, theorists such as Belgian industrialist Henri Fayol and American engineer Frederick W. Taylor identified the basic management functions which formed the basis for organizing work in the emerging factory system. These

functions—planning, organizing, budgeting, directing, and controlling—also formed the basis for managing the increasingly large bureaucratic organizations that began dominating modern society's landscape.

The development of the human and social sciences has profoundly affected management theory and practice moving far beyond Taylor and Fayol's "scientific" approach which viewed work and the organization from a "machine" perspective emphasizing the division of work into specialized tasks or functions with a command and control management structure. Concepts from psychology and sociology, in particular, such as group behavior, group dynamics, and collaborative work processes have found their way into contemporary management and organizational theory.

Theorists and management practitioners draw from a variety of concepts and theories in order to better understand and lead organizations situated in a rapidly evolving knowledge-based economy. Contingency theory, resource dependence theory, institutional theory, and organizational learning, among others, provide different insights and approaches into understanding the nature of work and organizations, and the critical impact of societal change on organization culture.

An ongoing workplace revolution is underway which is transforming society, organizations, and the role of managers. This definitely includes archives and archival managers at all levels of the organization. The management functions identified by Fayol and Taylor and modified by their successors remain required in the workplace. Leadership in management continues as an essential function required for organizational success. Yet, how these functions are carried out is undergoing great change. Information technology has revolutionized communications within organizations and between organizations and the external environment. The modern workforce is educated, diverse, and demands autonomy in the workplace. Managers are no longer commanding or directing staff and passing decisions down and information up the hierarchical ladder. Rather, in a world increasingly based on the effective acquisition and utilization of knowledge swiftly absorbed and communicated, the new paradigm for managers is one of complex organizational relationships. Picture for a moment a web of relationships connecting the managers with staff, other parts of the parent organization (the usual situation for archives), and numerous groups external to the organization. Successful management is based on understanding the complicated and changeable nature of organizational relationships and developing relationships to further the archival mission.

Particularly in any organization which is totally knowledge-based such as archives, managers cannot operate self-contained units. The varying ways in which managers relate to staff, to other parts of the institution, and to the complex world of customers (i.e., patrons, researchers, constituent groups, and the general public) demands a

new set of skills. The ability to manage diverse relationships is the ultimate measure of a manager's success.

Archival organizations operate in a variety of settings including the public sector, not-for-profit organizations, religious denominations, and corporations, among others. All have archival entities embedded in them. But archives in all of these settings increasingly operate within a reengineered and automated workplace. Managers can no longer just assign and monitor work, report to their supervisors, and operate in traditional ways. The flood of information coming in via the Internet, the Web, and the intranet is transforming the work environment. Staff members are able to communicate and perform their jobs in this automated milieu across the organization, the city, the state, the nation, and the world. Staff members are not really constrained to operate and communicate within traditional hierarchical channels. Management theories and techniques such as total quality management, business process reengineering, or knowledge management emphasize the critical importance of staff empowerment and investment in the institution's mission if long-term success is to be achieved. Corporate restructuring and tight budget times for all levels of government place archival organizations and staff members in potential peril.

Role of the Manager

The manager's principal contribution to achieving success for the archives is in managing multiple relationships. The archival and program staff must be "managed" in new ways. The manager more and more assumes the role of coach and mentor. The educated, Internet-savvy, and mobile workforce of today requires leaders who assist staff in developing individually and as a group. Teamwork, whether formal, ad hoc or a mix, dominates the workplace. The manager as coach must aid the staff in gaining the skills and the autonomy needed to make decisions about the work at hand.

The information-age manager must aid staff in learning decision-making and consensus-building skills so they can make as many work-process-related decisions as possible. This empowerment of staff, whether it takes place on the factory floor or the archives processing room, reflects widespread technological and social changes that have dominated the past 50 years. This new relationship is one where tasks previously considered as solely the prerogative of management are shared. The manager in the role of leader and coach shares responsibility and authority with those directly involved in a particular work process or project. This shared approach can take place in a variety of guises grouped under the term teamwork. Generally teams range from those tasked with ad hoc special projects to those working on recurring processes such as accessioning, archival processing, or reference service. Teams, to a greater or lesser extent, participate in such management responsibilities as planning, assigning work,

and performance evaluation. The relationship of shared responsibility and commitment with the staff is vital for the archival unit to perform at full effectiveness.

The successful manager must relate with the staff as more than the coach. Organizations can seem fragmented to staff as they and their functions undergo reengineering, restructuring, and outsourcing. The manager must become a builder aiding the staff to communicate with each other and with those outside the unit who share similar interests and needs. The manager must be flexible, open-minded, and knowledgeable of techniques such as communities of practice and hot groups. All this fosters creativity and the sharing of expertise and breaks out of the confines of rigid hierarchical systems built around stove-piped work processes and bureaucratic structures.

The manager must also build and sustain relationships beyond the archival unit. This is a critical aspect of the manager's full-time job in networking and relationship building. All archival managers operate in a competitive, cost-conscious, and technologically driven organizational climate. In a number of settings, such as universities, corporations, and the public sector, there are other parts of an organization that can compete with the archives as the provider of information and even records. Building relationships with other parts of the institution and with constituent groups outside the institution is extremely important. The manager must market the archives for its value, service, and contributions to the bottom line.

Building Partnerships

The demand for quality work and competitive efficiency is relentless. Regardless of the sector of the economy, archival programs seen as ineffective, too expensive, or irrelevant will disappear, most likely through elimination or consolidation with another unit. The basic mindset that the archival manager must have for external relationship building is the concept of partnership. Forming partnerships with corporations, relevant constituent groups, or other organizations with a compatible mission, services, or holdings is essential in meeting the archival program's objectives. Partnership aids in exploiting opportunities and coping with threats. For example, a partnership with a nonprofit organization or a corporation could be essential in digitizing and making available a particularly important collection. Getting the collection digitized and online could raise the archives' profile and earn additional support. To achieve these results, the archival manager must master the communication tools of negotiation and persuasion in reaching out to the external environment.

All this means that the manager must constantly demonstrate that the archives are so valuable, so essential for organizational success, that the archives not only survive but also grow. Organizations (like individuals) either move forward or decline. The status quo is never truly maintained. The manager's major responsibility is to

ensure that the archives move forward. Management is not an additional duty or a step up the organizational ladder. It is a calling with results for success and penalties for failure. The roles of the manager include that of mentor, coach, negotiator, and partner. But first and foremost the manager is a leader.

LEADING PEOPLE

Our understanding of the nature of leadership has evolved tremendously from the days of the nineteenth century British historian, Thomas Carlyle, who propounded the "Great Man" theory of history that claimed that leadership is reserved to those with certain personality or character traits. In other words, leadership is innate and always male. Contemporary theorists using a variety of different models offer what is called the "Networked Talent Model" for understanding the nature and role of leadership in modern, knowledge-based organizations.^[4]

From this perspective all members of the organization have leadership responsibility. Leadership roles will vary according to the individual's duties in the organization. Executives and managers must articulate a leadership philosophy and philosophy to guide the organization. But all staff members must have the opportunity (and responsibility) for input into the leadership philosophy and organizational vision. In a team-based environment, increasingly the norm in knowledge-based organizations, management and staff must work together to develop the most effective and efficient work processes to meet customer needs. This collaboration must result in products and services that are cost-effective and at an appropriate level of quality.

Everyone must exhibit leadership through commitment to the mission, the vision, values, products and services of the archives. Staff members must understand their place in achieving the mission and their responsibility for their own performance and that of the unit. A team-based work environment with an at least relatively flat organizational structure is most conducive to the "Networked Talent Model." With archives facing turbulent internal and external environments a collaborative management and work process is the only practical way to proceed.

While leadership is at all levels and throughout the organizations, managers have particular leadership tasks. Management as a team must begin the process leading to the articulation of a leadership philosophy for the unit. There is a wide range of possibilities ranging from the direct autocracy to a participatory style that puts a premium on widespread input, collaboration, and consensus. With the workforce in general (and archives in particular) ever more diverse, educated, and independent the participatory leadership style is the most appropriate for long-term organizational success.

In leading people the manager has an obligation to serve as a mentor for others in the organization. The

archival manager is responsible not only for his or her own self-knowledge and development, but also for the development of leadership and management skills by all others on the staff. Most importantly, this can be done by example. An organized, competent, and effective manager who focuses on the mission of the organization and of the staff becomes a model of professional leadership. Attention to big-picture issues as well as to routine management chores such as timely and accurate personnel performance appraisals demonstrates how a concerned manager operates.

Mentoring includes assisting employees in developing individual development plans for professional growth and advancement. Where appropriate and in keeping with the perspective of the "Networked Talent Model" these plans should have leadership and management components. The mentoring manager should identify training courses or educational programs that will aid employees in developing leadership and management skills. Training assignments in other parts of the organization, e.g., may be part of a mentoring effort, as well as allowing staff members to "shadow" managers to observe firsthand the duties and responsibilities of management.

The archival manager should work with the institution's Human Resources Department to utilize existing mentoring programs or to develop one if needed. Leadership and management competency is not a gift. It is a set of skills developed over time through education, training, and experience. Part of any good manager's legacy is leaving behind competent leadership to assume the responsibilities of management.

Communication

There is one critical ingredient necessary for the manager to succeed as leader, coach, mentor, team-builder, negotiator, and partner. This is the ability to effectively communicate. It is almost a cliché to blame everything on "poor communication." Yet in many situations it is a fundamental problem. What most managers do not understand is that though we communicate everyday and the process seems normal, it is in fact a complex phenomenon involving the senses, emotions, and logic. Linguists have long-studied the two-way process called communication. Whenever communication occurs, either between individuals or in a group setting, there is similar abundance of sensory stimuli as well as emotional factors, sometimes labeled biases or blinders, so that what is said or heard is only a highly condensed or abstract version. Lack of communication is a fertile area for workplace difficulties.

There are several elements that comprise communication: verbal, nonverbal, and listening. Words can be spoken or written and the communication expressed through words is more than a linear progressive unfolding of logic. Words reflect cultural backgrounds, have different meanings in different contexts, and can be difficult to interpret

if the words or thoughts are too abstract. Nonverbal messages (i.e., tone of voice, body language, and facial expressions), in fact, are estimated to account for more than 90% of communication between people, while verbal communication is estimated at 10%. Listening, a skill that can be supported and strengthened through training, is another critical element of communication. Effective listening is acutely impacted by sensory overload, feelings and emotions which, in turn, affect what is heard or understood.

Clearly, the manager alert to the manifold issues affecting communication should expect more often than not to be misunderstood. When it is all said and done, the basic task the manager must achieve is creating and sustaining a communications network. The manager's task is to appropriately create, use, and disseminate information. From the perspective of the organizational complexity and relationship paradigm the manager and staff must identify the basic needs of the archival unit as well as the parent institution; identify the specific information needs of staff and public; and create a communications process that enables effective decision-making and policy dissemination.

There are many tools and strategies that can be used to build an effective communications network. Well-structured meetings and presentations with an agenda, "rules of the road," and definite start and end points are essential to every organization. Judiciously using tools such as e-mail, the Web, the Internet, and intranet can keep management and staff involved with and informed about policies, procedures, and administrative information. This can contribute to organizational knowledge, assist in democratizing the workplace, and enhance productivity. Never underestimate the power of informal hallway conversations to further the communication goals of the organization. But above all communication is about trust. If the manager is perceived as fair, approachable, and competent by the unit, the manager will survive the times of stress and turmoil arising from inevitable communication problems.

Leadership and management are clearly complex tasks. Among the many relationships the manager must build and sustain is the one with the Human Resources Department. A key element of the administrative and communications process is to have fair, transparent, and clear personnel rules and processes. The manager must work closely with the Human Resources unit in analyzing work processes and staffing needs; and in structuring positions, writing position descriptions, and recruiting staff appropriate to the needs of the organization. All these steps involve administrative, legal, and regulatory requirements that must be met. A close working relationship with Human Resources specialists is critical to managing a fair personnel system.

In today's society the manager must be alert to the reality and demands of a diverse workforce. This directly impacts on the need for a personnel system perceived as fair, and an effective communications process.

How policies, e.g., are crafted and written can be problematic. The needs of a workforce transformed by profound social and cultural change must be harmonized with the requirements of the archives' mission and services to its customers. All of this is best undertaken with a leadership philosophy that is participatory and inclusive, and with the sure understanding that everything communicated will be filtered through sensory stimuli and emotions, as well as logic.

MANAGING INFORMATION

Management theory and practice, leadership, and communications are the foundation for the other tasks of archival management. Foremost among these is managing the key asset of information. Within this broad rubric is strategic and operational planning, information technology, and the specific skills involved with project management. Every archival organization, regardless of its institutional setting, is engaged in a fierce competition for resources and relevancy. Careful planning supports an effective strategy-making process which enables management to meet the requirements of the archives' mission and to obtain the financial, personnel, and other resources needed for success. Careful strategic thinking, planning, and decision-making are critical for survival, much less success. Done effectively, planning is at the heart of mission achievement.

Planning

Planning is how archives attempt to create its future situation by setting goals and strategies to reach those goals. This involves looking ahead with the information available to estimate what is likely to occur using a variety of tools and techniques. The effectiveness of archival planning depends on the quality of the planning process itself as well as the quality of the strategic thinking and decision-making which planning supports. Archives must develop plans and strategies to meet their mission, goals, and objectives and relate them to the direction and purpose of the parent institution. Planning serves as the focal point that integrates all the organization's activities needed to meet the mission and goals of the archives. In broad terms, planning is both strategic and operational.

Strategic planning is a concept and practice deeply embedded in corporate, governmental, and academic institutions. There are three ways to create strategy: learning, vision, and planning. All three must be utilized and integrated in any process used in developing a strategic plan. The actual nature of the strategic planning process will be determined by the type of organization (i.e., hierarchical and centralized; hierarchical and decentralized; flat, less hierarchical), and by the management's leadership philosophy. For example, organizations which put a premium on a participatory management philosophy will use a team approach

to strategic planning. Staff members and management from all levels work as a team to develop strategies and plans, with all employees provided a chance for input.

Whatever model or approach is adapted, the first step is analyzing the archives' strengths, weaknesses, opportunities and threats (SWOT analysis). This analysis looks at external factors such as funding, technology, and demographic changes, as well as internal factors such as organizational culture, quality of staff, and technical and facility infrastructure. It is also critically important to have a trained, outside facilitator to assist in guiding the strategic planning process. In addition, outside experts and constituent and user groups must provide input so that the environmental SWOT provides as accurate as possible perception of the environment.

The SWOT environment is part of the learning methodology in creating strategy. Mission and vision are also needed to define effective strategies. This is defining the organization's reason for existence at the highest level. In other words, what makes the archives unique, those whom the organization serves, and the holdings which the archives acquire, preserve, and provide access. The vision puts the mission in broader societal terms and purposes. Also, a statement of institutional values needs to be developed as part of the process. Values are those that the archival organization seeks to inculcate in its employees and in the organization's culture.

After the SWOT analysis is completed and the mission—vision—values are crafted, strategic goals are identified. These should be overarching, responsive to the articulated mission and vision, reflective of the opportunities and challenges facing the archives, and what the organization must achieve to be successful. Strategies must be determined which lay out the various avenues that should be pursued in order to fulfill the strategic goals. Strategies may include forging new institutional partnerships, exploiting technology in a different manner, or creating additional sources of funding. Because strategic plans cover anywhere from a 5 to 10-year time frame, it is necessary to identify objectives or tasks on a yearly basis as measurable milestones toward achieving the strategic goals. Objectives are assigned to units in the archives, with performance plans for managers tied, at least in part, to achieving the objectives.

In addition to the strategic plans, the archival manager must also ensure that a yearly operational plan is developed which covers all program activities and functions of the archives. The operating plan accounts for the hours to be expended for the year ahead by all categories of employees (including volunteers). The plan should also account, by function, for the units of work to be accomplished by the staff. Each program activity should be broken into major subcategories that constitute the tasks to be carried out. The program functions, activities, and subcategories that constitute the tasks will vary from archives to archives but must cover all the records of life-cycle activities carried out by the archives.

Policies and Procedures

A key activity related to planning is the development of policies and procedures that provide the structure and content needed for successful operations. A policy is a governing principle that provides overall guidance to the way in which archive conduct their business. Policy guidance, which is general in nature, is refined and standardized through the use of specific archival procedures. An access policy, e.g., outlines who may use archival collections, when they are open for research, and how researchers can gain access to closed collections. Procedures outline how staff members are to deal with researchers when they visit or communicate with the archives. For example, access procedures would cover such issues as how written requests for information (letter, fax, e-mail) should be handled; how the research room will be managed, addressing issues such as where personal belongings of researchers are to be placed; and what specific steps should be taken when researchers request access to restricted collections. To implement all this, manuals should be prepared that codify the policies and procedures. This is critical both for staff training purposes and for reference when questions arise from staff members or researchers.

Any planning effort is only as good as the results. It is vitally important to have a management performance measurement system in place to monitor organizational performance. Managers and staff together are responsible for setting measurable objectives and setting up systems to measure the quantity and quality of work necessary to achieve program goals and objectives. Quality is a particularly important issue. With limited resources all archives must meet customer expectations, process collections, and preserve holdings. Work must be done well the first time. Quality work is the only answer. Quality standards should be incorporated into the archives' procedures. Further, quality of work must be included in the performance measurement system. Quality can be measured. For example, standards can be developed that addresses the extent of research to be undertaken into a reference inquiry or the elements that must be included in a quality response. Managers and teams can use auditing or sampling techniques to review reference responses for adherence to quality standards. Quality standards should be incorporated into standardized procedures, and then into individual and team performance standards.

Project Management

An important component in the effective use of organizational information and knowledge is project management. The Project Management Institute defines a project as "a temporary endeavor undertaken to create a unique product or service."^[5] Successful project management requires effective teamwork, good planning, and the creative use of available information. Projects are really building

blocks in the design and execution of an organization's strategic goals and objectives. Projects often involve a matrix management where horizontal teams pulled together from across organizational boundaries are grafted on, for a time, to the vertical hierarchical structure. Projects by definition are temporary, finite, and goal-oriented.

Project management involves the overall context in which the project takes place (i.e., organizational environment, role of stakeholders), scope management and planning, human resources management, and integrating the project into the products, services, and work processes of the organization. Because projects and project teams are temporary, cross-functional, and operate under tight time and logistical constraints, a clear understanding of roles and responsibilities within the organization is critical for success. Project managers and team members must be carefully selected based upon their skills and expertise and the requirements of the project. The project manager must be able to negotiate and obtain the resources and support to complete the project. Senior management is responsible for ensuring that the needed support is provided by other parts of the archives.

Careful planning and execution of all aspects of the project life-cycle forms the basis for project accomplishment. Every project goes through four stages: conception, definition, acquisition, and operation. Although projects impact on existing systems of operation and organization already in place, the project itself as it goes through the four phases of the life-cycle is also a system of people and resources integrated, organized, and managed to achieve the goals of the project. The project manager and the team must understand the project as a system and manage all the parts and relationships.

As an example of how a project can impact an archival system, consider how most archives permit copies of records to be made for research purposes. To carry this out, most institutions will have some sort of order fulfillment system. The parts of such a system include archivists, conservators (for fragile records), accountants (financial controls) and, in many cases, information technology staff if the system is automated. Researchers are also part of the system. A project to devise a new order fulfillment system or even to change one component must involve looking at the big picture of how the whole system operates and the interrelationship of the parts.

There are also a number of methodologies available for systems or project management. These include systems analysis, systems engineering, and systems management. The basic principles in any methodology involve looking at an entire work process and how systems relate to one another. When analyzing a system or process, the project manager and the team must understand how a change in one part of the system affects other parts (systems thinking). For example, a change in the pricing structure may impact the number of copies made and this will have an impact on other parts of the system. Another principle

utilizes problem solving (systems analysis) as the basic project tool or methodology. Problem solving includes clarity about requirements and project objectives, setting criteria for making decisions, and examining alternative strategies to achieve the desired goals of the project. Thus, if the project manager and the team do not take a holistic approach to the project, the chances of achieving the desired result are markedly diminished.

In every contemporary organization the effective acquisition, use, and distribution of information is profoundly affected by information technology. Information technology is basically a tool; like other tools, designed to assist in planning, decision-making, program support, and customer service. All management tools or instruments must be designed and implemented to carry out the archives' mission (effectiveness) in the most business-like manner (efficiency). All tools and instruments must be evaluated on the basis of these two fundamental criteria. This is particularly critical given the cost and complexity involved with information technology.

Archival managers cannot expect to become experts in the information technology arena. But the archival manager does need to bring archival skills and knowledge about records and records systems together with information technology. For example, the ways in which records are appraised and scheduled, described, and made available are increasingly affected by information technology through use of the Web and distinctive markup language (hyper text markup language, HTML).

To manage in this complex environment the archival manager must engage in systematic information technology analysis, planning and decision-making. The use of information technology must flow from the archives' mission, goals, objectives, and business needs. The core of effective information technology planning (as with all other planning) focuses on customers, products, and related work processes. The International Council on Archives have developed a planning and decision-making process for the use of information technology in archives.^[6] In addition to identifying the customers in the archives' strategic plan, other steps include identifying products and sources required by the customers, and business processes designed to produce the products and services. Archivists are expected to understand these business requirements, and to work with information technology experts in determining appropriate information technology architecture; hardware, software, and communication tools; and the application, acquisition, and development of the information technology support system.

MANAGING MONEY, FACILITIES, AND RELATIONSHIPS

As if mastery of management theory and practice, leading people, organizing work, and managing information were

not enough, the archival manager must also master the management of financial resources, the operations of archival facilities, and building effective public relations. As in every other aspect of management, finance requires a careful review and understanding of an organization's operating environment. The manager must understand how the archives receive its funds, the sources of the funding, and the procedures involved in obtaining the funding. On the other side of the financial ledger are expenses. How do the archives expend the resources allocated to it? What authorities must grant permission before the archives commit resources to personnel, facilities, equipment, or other costs? The answers to these questions represent the financial control function of management.

Managers must fully integrate financial planning with plans for the acquisition and use of personnel, facilities, and other resources. The plan—and its attendant costs—must be matched against the revenues likely to be available to the organization. All revenue projections should be realistic in that they reflect possibilities that might actually occur. For example, an organization applying for grant money to accomplish a project is realistic in calculating the availability of the requested funds, especially if it has successfully competed for grants in the past. As part of the financial planning all fixed resources must be prioritized. The archives must know which operations have the first claim in money coming in, which comes next, and so on. In most instances, current operations—being able to sustain ongoing efforts—come first. Expansion and new projects must compete for whatever is left. This emphasis, though it may seem to discourage innovation and experimentation, is entirely appropriate for archives, which are essentially conserving institutions.

Budgets

Careful budgeting is another key element of financial management. Budgets are necessary for planning and controlling funds, as products of the planning process, and as tools by which managers control the expenditure of resources. Effective budgeting is part of a multiyear (three to five) process in advance of planned activities. There are various types of budgets such as line-item budgets and program budgeting that are appropriate for both small archival operations as well as more complex organizations. Whatever type of budgeting is used, archival managers must bear responsibility for cost controls. Records of expenditures must be kept in whatever format the institution requires. Expenditures need to be tracked on at least a quarterly basis to ensure that the basic tenets of the financial plan are being met.

Resource Development and Outreach

The archival manager's financial management responsibilities may include participating in fund raising and

development for the archives. This involves planning and identifying program needs beyond what can be met through the organization's regular funding mechanism. This involves seeking external funding and working with the development office of the archives or the parent organization to seek grants or initiate capital or endowment campaigns. Federal, local, and state governments provide a variety of grants through a number of grant-giving agencies. In addition, there is extensive philanthropic giving by foundations.

Involvement with managing archival facilities seems the most mundane and tedious of tasks. Yet, it is one of the most critical management tasks. Archivists must be able to work with facility managers, conservators, architects, engineers, and contractors to ensure that the archival holdings are kept in appropriate storage conditions; that supplies and equipment obtained are archivally sound from a preservation perspective; and that adequate space is designed and obtained for the archives. All archivists are faced with planning for the best use of their facilities as well as for the purchase of supplies and equipment. Such decisions have a significant impact on the total program and should always be carefully considered. Through applied common sense backed by thorough research and information gleaned from conservation experts, the archivist should be able to make decisions which lead to positive results and an improved archival program.

All that has gone before in describing the elements of archival management rests upon the need for an effective public relations program. Public relations are the communication or dialog which archives have with individuals or groups inside and outside their institutional setting intended to convey information about services and goals. This can be done in a variety of forms: up to date and informative Web sites, press releases, communications between staff and researchers, or annual reports prepared for the parent organization.

Public relations also include special events designed to invite specific groups to ceremonial openings or other events. Communication must be a part of a well-planned program designed to explain the archives' mission and involve people in its programs. Public relations is an integral part of archival management. It must be a deliberate effort and should be included in the strategic planning process. Plans for public relations should evolve from the archives' mission statement that defines not only program goals but also the constituencies to which the archives are responsible. A variety of communication tools should be used to approach these groups—open houses, lecture and film series, exhibits, press releases, newsletters, listserves, e-mail lists, and fax lists. With limited resources the public relations effort must target the audiences it wishes to reach and the methods that will most effectively communicate with particular groups.

Public relations are critical in developing and maintaining support for the archival program. With the

information overload felt by individuals in modern society, people will not go out of their way to learn about new programs or new ideas. Information about archives must be brought to people in familiar and understandable ways. Failure to build support for the archives through a public relations program may lead not only to a lack of funding but also to the demise of the program itself. Successful archival managers must find ways for their programs not only to survive, but also to prosper, and this can only be done through a planned and thorough public relations program.

CONCLUSION

Contemporary archival management is complex. The pressure for high performance grows steadily more intense, with sustained, effective leadership as perhaps the single most important ingredient for organizational success. Leadership at all levels of the archival enterprise must build an organizational commitment to the mission, vision, and values of the archives, with a pledge to meet customer needs by providing quality products and services in a timely and cost-effective manner. Archives are cornerstones of memory, community, and the historical record. Those engaged in the work of archival management play a key role in maintaining a democratic society rooted in the right of access to records and information.

Archival Reference and Access

Mary Jo Pugh

Editor, *American Archivist*, Walnut Creek, California, U.S.A.

Abstract

This entry introduces reference services in archival and manuscript repositories and concepts of access to archival holdings. Archival holdings and reference services differ significantly from those typically provided in library settings. This entry is distilled from my book, *Providing Reference Services for Archives and Manuscripts*. Archives are tools; like all tools, they are kept to be used. Archives allow people to communicate information and evidence through time. Reference services in archival and manuscript repositories assist users, and potential users, in using archival holdings and locating information they need. This entry discusses the nature of archival holdings, institutional settings, and the range of uses and users of archival records. It explores information seeking and its relationship to archival reference services. The essay discusses the intellectual, interpersonal, and administrative elements of providing reference services in archives and manuscript repositories. It concludes with a brief consideration of outreach, management, and evaluation.

INTRODUCTION

Reference services" in archives provide "intellectual," "legal," and "physical" access. "Intellectual access" is provided through arrangement, description, and reference services. Traditionally, reference services have been mediated. Increasingly, however, they are provided through the repository website or online finding aids and are unmediated or mediated through e-mail, tutorials, or Web 2.0 tools. In a mediated setting, interpersonal dynamics between reference archivists and users are critical to successful transactions.

Second, the word "access" can also be used in a narrower, "legal," sense, meaning permission or authority to use archival records. Third, "physical access" means providing opportunities to examine records, traditionally in person in a repository, but also through copies, digital surrogates and loans.^[1]

ARCHIVAL REFERENCE

People create documents to communicate across space and through time. Records provide "evidence" of the actions that created them, long after the actions are completed. Records also provide "information" about the people, events, and objects that were the subject of these actions.^[2–4]

The mission of the archival profession is to identify records that have continuing usefulness, preserve them, and make them accessible through time. The use of archives depends, in part, on the mission of the parent organization. Three common rationales for maintaining archives are:

- Continuing administrative use by the creating institution.
- Public use of government records in a democracy to provide oversight of government actions, ensure accountability, and preserve the rights of its citizens.
- Research by users from a wide variety of disciplines.

Reference services were slower to develop an identity than other functions of archival administration, perhaps because early archivists assumed that reference services fall at the end of a continuum that begins with the creation of the records in the originating office (shaped by records management), followed by appraisal, accessioning, arrangement and description, and concluding with reference services and outreach activities. Driven by the need to manage and protect large quantities of records, archivists initially thought of reference services as a series of administrative decisions made after records had been appraised, accessioned, arranged, and described. Since the 1970s, however, archives have become user-centered and recognize the importance of reference services. This interest has led to new research into the users of archives, which has increased with electronic access to archives. The archival profession moved from a custodial role, in which the archivist's primary duty was to protect repository collections by limiting use, to an activist role in which the archivist's primary duty is to promote the wider use of archives.

Uses and Users of Archives

Many people use archives, both directly and indirectly, to find information or evidence for a purpose outside the repository. Practical needs bring most people to archives;

most are less likely to seek entertainment or recreation than they might in many libraries (Fig. 1).

to build structures and they are needed for as long as the structure is maintained.

THE USES OF ARCHIVES

Primary Uses of Records

Organizations and individuals create records initially to carry out administrative, fiscal, economic, social, legal, or other activities.^[5] These uses may continue as long as the organization continues. Architectural records are created

Secondary Uses of Records

Some records, however, can be used by a wide variety of users beyond the creator. These secondary uses may be of three types. “Informational” use describes the continuing usefulness of the information in records about people, events, objects, or places. “Evidential” use is the continuing usefulness of the evidence (or information) that records provide about their creators, their activities, or the

Fig. 1 The information family tree.

Source: From Understanding society through its records, by Pederson, A., <http://john.curtin.edu.au/society/evidence/tree.html>.

actions that generated the records. File contents and filing structures can be as important for documenting the flow of information as for retrieving it. “Intrinsic” use describes records as artifacts—as symbols, or tangible links to the past. Although uses are practical, users often find the age, authenticity, or beauty of original documents as important as the information or evidence they contain. Authentic documents often move and even awe people.

Direct Use of Archives

Direct use occurs when someone obtains information from a record or uses a record as evidence of the activity that it documents. Direct use can be measured when someone reads a document in the repository, obtains a copy by mail, or receives information by telephone, e-mail, or letter. Loaning documents is another type of direct use. Placing records on the Internet means that many remote users can consult them directly, but this direct use is harder to measure.

Indirect Use of Archives

Identifying and measuring indirect use is more difficult still. Indirect users may never enter an archives or archival Web site, but benefit nevertheless from archival information by using the many and varied products arising from direct use. Though a relatively small number of researchers actually uses archives, their work has a “multiplier effect,” transmitting information that affects how others think about themselves and their past.^[6] Books, newspaper and periodical articles, dissertations and theses, genealogies, speeches, term papers, films, television documentaries, slide shows, exhibits, Web sites, legal briefs, environmental impact statements, and other policy documents are some of the products that convey information and evidence derived from archival holdings.

UNDERSTANDING INDIVIDUAL NEEDS

People come to archival repositories because they need to solve problems that require historical information or evidence of past activities. Direct users have a variety of needs depending on several variables.

Research Purpose

Research purpose is in part determined by whether the user’s information problem is motivated by work requirements or by personal interest. Most people come to archives because their work requires it, whether on behalf of a business, government, association, university, class assignment, or client. They are motivated by external rewards. Other researchers come to archives because

they seek information for enjoyment, recreation, or personal growth.

Intended Use

The intended use—report, film, exhibit, family history, book, article, legal brief, advertisement, or environmental impact statement—affects the types of information sought and the questions asked. It is helpful to distinguish between the form or genre of information and the media on which it is stored. Reference archivists need to understand the form of evidence that researchers require for their intended use. For example, minutes of meetings may be found as paper summaries, paper transcripts, audio-recordings, video recordings, or electronic documents.

Type of Question

Factual researchers typically ask closed-ended questions, seeking a particular document or specific information about a particular person, place, object, or event. Their questions are precise and focused, asking, “Who, What, Where, When, How many, or How much?” Although precise, such questions may require considerable time and ingenuity to answer.^[7,8] Interpretive researchers ask more abstract questions, intended to increase general understanding or competence. Such users read comprehensively through bodies of records to tell a story, develop a narrative, or test a hypothesis. Posing open-ended questions, they seek to answer broad questions of motivation, causality, and change. They ask the question, “Why?” William L. Joyce formulates a similar distinction.^[9]

Joyce.^[9] Experience and Preparation

Many users, regardless of education, occupation, or nature of inquiry, are not well versed in archival research. They may need help in conceptualizing the research process, analyzing the process of finding relevant documentation, and devising search strategies. Once launched on research, they may need assistance in understanding the context of the records, or practical help deciphering handwriting, understanding dating conventions and abbreviations, or interpreting slang and references to contemporary event.

IDENTIFYING USER GROUPS

Identifying Vocational User Groups

Staff of the parent organization are an important user population. Archives, the corporate memory of the institution, are preserved so that the parent institution can understand its history and the sources of current policy and can maximize its return on its investment in information resources. Archives are used to ensure continuity, build

on experience, and identify solutions for current problems. Since administrators of the parent institution are simultaneously creators and users of archives, access and reference policies may give priority to their requests. Archivists are the employees most likely to know an institution's history and organizational changes and can identify precedents, policies, and documents relevant to current issues.

Staff from other organizations also use archival resources in their work. These users represent many professions, such as lawyers, legislators, engineers, landscape architects, preservationists, urban planners, architects, film and television producers, picture researchers, journalists, and publishers. These professionals are direct users linking archival sources to many indirect users. They use archival information on behalf of groups, clients, firms, governments, or professional associations.

Many assume that *scholars* are the primary constituency for archives, but in most repositories their numbers are significantly smaller than other user groups. As direct users of archives, however, scholars transfer information from archival sources to indirect users of archives. Many disciplines use archival holdings—history, geography, political science, demography, sociology, literature, medicine, epidemiology, among other. Whatever their field, scholars are more likely to be interpretive researchers.

Students are a major constituency of many repositories, particularly university archives and manuscript libraries on or near college campuses. Secondary school classes have become significant users of archival material as some state curriculum standards require this component. In addition, the National History Day competition brings requests from students as young as middle school, following instructions to use primary sources in their research. Using archives can make history come alive for students, whether young or old. Providing access to archives empowers students to learn and discover on their own. Most students, like the general public, respond enthusiastically to the authenticity of original source materials.

For *teachers* archives are laboratories for research in the humanities and social sciences and archivists and teachers work together to instruct students in research. Archivists have new opportunities to collaborate with K–12 teachers in local schools and with universities who teach potential teachers to improve teachers' knowledge, understanding, and appreciation of American history.^[10-17]

Identifying Avocational User Groups

Avocational users are “recreational” or “leisure” users. Archives play a significant role in educating the general public, providing opportunities for lifelong learning for a public that is better educated and living longer. Many people who found classroom history boring or even alienating search eagerly for a personal, usable past.

Genealogists: Many Americans seek meaningful connections with the past through family history. Genealogy, one of the most popular hobbies in America, appeals to all economic, racial, and ethnic groups. Genealogists have been called “historians of their own family,”^[18,19] and they often share the results of their research with other family members. Because the direct impact of genealogy beyond individuals is not easily measured and because of its past association with elitist societies, its value has been discounted or dismissed as idle curiosity. Many genealogists are expert researchers who have completed many projects using primary sources and have wide-ranging and sophisticated interests and research skills.

Local historians are examples of avocational historians. Like genealogists, their interests reflect a modern society's need for a usable past. Community celebrations and anniversaries often stimulate interest in local history. These may focus on the community as a whole or on its many parts: churches, civic groups, businesses, schools, labor unions, ethnic groups, hospitals, or other institutions. Homeowners or business owners seek information about the history of their house or company.

Hobbyists find meaning in the past by focusing on selected historical objects and events. For almost any common object or event, a group is devoted to its preservation and history: trains, ships, lighthouses, bottles, circuses, automobiles, carousels, prospecting, and military engagements.

INFORMATION SEEKING AND ITS RELATIONSHIP TO ARCHIVES

Information retrieval is the identification, preservation, and description of information, anticipating user queries. In contrast, information seeking focuses on the needs, characteristics, and actions of the information seeker. Information surrounds us all (Fig. 2). People use their mental models for events, experiences, and domains of knowledge to run scenarios for contemplated actions. Information seekers in organizations tend to turn first to people, then to readily available personal collections and electronic resources to answer information needs. Libraries are seldom the first choice, archives almost never are.

Seeking Information from People

Face-to-face oral communication remains a preferred means of communication, because much human communication remains nonverbal and nonverbal elements carry meaning. Personal interaction also provides the opportunity to clarify meaning. Seeking information from others is so ingrained in our daily behavior that we take it for granted. People seek information from other people because such information is filtered and, more importantly,

Fig. 2 Information seekers are surrounded by information.
Source: From Pugh.^[1]

authenticated by experience. Information givers responsible for their actions are given credence.

Seeking Information from Documents

Common information-bearing objects are found in personal collections, records, electronic networks, and libraries. Research suggests that people will use accessible information, regardless of whether it is the best. The “principle of least effort” is well documented.^[20]

Personal collections

People tend to turn first to personal collections. They compile some tools personally, such as calendars and lists, reach for familiar books close at hand, such as procedures manuals and reference books. Most of these information sources are organized and retrieved by physical location and by form, such as size, shape, and color. People select sources close at hand, not because they are lazy, but because these sources are authenticated by personal experience, annotated to reflect recent changes, and accommodate time constraints in the press of daily business.

Records

People also turn to their working files, such as reports, research notes, and correspondence. This observation also helps archivists understand why staff members are often reluctant to send their records to the archives. Organizations, whether corporate, governmental, non-profit, religious, or community, embed evidence of activities and

corporate knowledge in documents and capture them in records systems.

Electronic resources

Personal reference files are now created and retained mostly in personal computers. As computers are linked in local area networks within organizations or through the Internet to other organizations, users now rely on online tools and information resources. These convenient tools also add powerful modes of retrieving and repurposing information.

Libraries

To turn to libraries, people must first conceive that a book or article might be published on the subject of interest, that is, the user must have a mental image of finding the information in a publication. Library users have effective search techniques beyond the catalog, and studying actual information-seeking behaviors offers insight into the assumptions and expectations of information seekers as they approach archives.

Many users prefer browsing, which provides full-text retrieval. By scanning the table of contents and bibliography, users can quickly determine the relevance of a publication. Library classification systems collocate material by subject, and propinquity reinforces the serendipity of discovery. Browsing emphasizes to the physical nature of information seeking. Users accustomed to this powerful technique may be frustrated by closed stacks and gray boxes arranged by provenance in archives.

Chasing footnotes is another common behavior. A footnote is information in context. The nuances of a subject reference can be very precise when a footnote barks at the heels of a sentence, in a way that subject headings in a catalog cannot. Further, the footnote also evaluates a source. Footnotes are a means of authenticating an argument, but they are also a means for people to communicate about sources of information.^[21] Although we think that users are looking for all bits of information, these search techniques indicate that they are often looking for authenticated, evaluated information in context, the kind of evidence found in archives.

Information Seeking in Organizations

When seeking information for their daily work, staff members typically rely first on their own memory or on readily accessible records that document their knowledge and actions, whether analog or digital.^[22–25] For information beyond their memory, files, and scope of activity, staff consult other people. People trust information selected and authenticated by the person responsible for the action. An employee summons knowledge of the organization and its functions to infer what person or department is responsible for activity and its associated

information. Employees (and their clients or customers outside the organization) find information by asking, “Who is responsible? Who keeps that information? Who would know or need to know about this problem?”

Often this information-seeking behavior is so ingrained that people do not think about these processes, and the search for information is so obvious that the process is transparent. Information seeking is grounded in a world of personal networks and increasingly in networked electronic environments.

Information Seeking in Archives

Information seeking in institutional archives builds on these patterns in the parent institution. Although people leave, the organization continues. Records documenting significant actions with continuing consequences are transferred to organizational archives so that later incumbents or others seeking evidence of past actions, can find them. Some staff members know that records of their predecessors are in the archives. Other staff ask, “who would have created this information in the organization in the past and where are the records now?” As time passes, however, the reference archivist is needed to assist staff members in asking these questions and locating information.

An important question is, “How do people find archives?” Researchers still find their way to archival repositories through informal personal networks, that is, by word of mouth. Electronic networks are, however, becoming increasingly important.^[26,27] Archivists must be part of the personal and electronic networks of their organizations or communities.

Reference Services in Archives

Reference services are the activities by which archivists bring users and records together to meet user needs. Reference services assist users in person in the research room or remotely by telephone, mail, fax, or e-mail systems. Public programs also provide reference services. On the Internet, reference services assist users who discover them there (Fig. 3).

- Intellectual elements
 - Arrangement

 - Reference services
- Human dimension: Interpersonal elements
- Administrative elements

Fig. 3 Fundamental elements of reference services in archives. Source: From Pugh.^[1]

INTELLECTUAL DIMENSIONS OF REFERENCE SERVICES

Intellectual access, provided both through arrangement and description of records and through reference assistance, is the process of identifying and locating records likely to contain information useful for solving problems.

Facilitating Research

Because archives are the products of activities and recording technologies, understanding and evaluating archives requires knowledge of the organizations and individuals creating them and the historical context, organizational communication patterns, and recording technologies producing them. Archival arrangement according to provenance, though critical to understanding organizational context, is unfamiliar to many users and may be difficult for users outside the organization or even for later users from the organization.

Facilitating research requires continuing interaction between archivist and user throughout the research project and may not be completed until the last question regarding copyright or citation is answered. In addition to using records and descriptive tools within the repository, reference archivists often facilitate research by referring researchers to other sources beyond the repository.

Undertaking Research

Undertaking research is a second important intellectual role. Reference archivists undertake research to learn about the parent organization and records creators, to understand the functions and forms of records, to place the finding aids and records in context, to locate information in the records for others who cannot do so, and to evaluate records or information. They also undertake systematic analysis of the use of their holdings to improve access and services.

Educating Users

Educating users is a third essential intellectual function. Instructing users in the research room is an important part of daily work. Few users have experience with primary sources, and most are unprepared for the complexity of archival sources, finding aids, and archival practice. Most have no experience integrating and understanding the undigested mass of information so often found in primary sources. Archivists impart an understanding of archival theory and practice, to provide “archival intelligence” which is an “intellectual framework for understanding both the organizational principles behind archival records as well as the multiplicity, interconnectedness, and appropriate selection of one type of access tool over another.”^[28]

Reference archivists also participate in more formal educational programs. Orientation sessions, class presentations, workshops, publications, tutorials, and online presentations extend the ability of the reference archivist to help users to be more efficient in exploiting archives. Increasingly, these educational programs are presented through a repository's Web site.

INTERACTING WITH USERS TO PROVIDE INTELLECTUAL ACCESS

The extent of reference interaction varies from simple to complex, depending on the nature of the repository, the kinds of finding aids available, the research problem, and users' research skills. Not all users require, or even desire, all elements of the reference process, nor do all repositories have sufficient staff to carry them out. The reference interaction has both intellectual and administrative elements and is powerfully affected by interpersonal dynamics between user and archivist (Fig. 4). The quality of reference service depends on acknowledging and successfully resolving the complicated dynamics of reference transactions. An effective reference interaction enables a user to exploit archival resources fully, while meeting the administrative requirements of the repository.

Question Negotiation

As an intellectual exchange, the reference interaction consists of three activities: "query abstraction," "resolution," and "refinement," through three phases—initial interview, continuing assistance, and follow-up activities.^[29] Query abstraction and query resolution usually take place during the initial interview. Since query refinement takes place during research, interaction between user and archivist may be needed throughout the research project. Interaction may be extended by phone or e-mail follow-up activity after the researcher leaves (Fig. 5).

Fig. 4 Intellectual dimensions of reference services in archives.
Source: From Pugh.^[1]

Fig. 5 Question negotiation.

Source: From Pugh.^[1]

Initial Interview

The initial interview, an intellectual interchange between archivist and user, is the archivist's opportunity elicit what information the user needs for the inquiry, and the amount, variety, level, and complexity of the source materials needed to resolve it.

Query abstraction

The initial interview begins with question abstraction, in which the seeker and the archivist identify the topic, delimited by time, place, and the researcher's intended use. The archivist tries to glean enough information to translate the user's natural language into the retrieval language of the finding aid system. Reference staff and researchers ask questions to determine which archival and manuscript collections will be most useful. Asking such questions helps to educate researchers about the process of finding information in archives (Table 1).

Query resolution

In the second stage, the archivist and the user analyze the problem to form a search strategy. The archivist assesses available sources, identifies records, and suggests an order in which the researcher might use them. Based in part on an assessment of the probability of finding useful information, the archivist helps the user identify some sources as highly relevant, others as possibly useful, and others as of marginal interest. The arrangement of a series may dictate the sequence for the research strategy. For example, to use

Table 1 Question negotiation.

Question	Information sought
Who would have needed this information or evidence?	Names of persons, organizations, places, and events. Research subjects must be linked with the activities of specific individuals and organizations and their records.
Why would someone have needed this information or evidence?	Functions that would have required this information or evidence suggest organizational entities or individuals whose records might be useful.
What time period is of interest?	Date range
How might this information been recorded?	Recording technologies available at the time. Forms of records likely to have relevant information: textual, audio, visual, graphic, digital.
Where would those records be now?	Archival access tools to locate likely sources.
What product will result from the research project?	Assists in identifying the most useful types of sources and alerts the archivist to potential legal ramifications, such as copyright.
How much time is available for this research?	Research for a speech to be given tomorrow differs that for a dissertation or book.
Is the user asking on behalf of someone else?	A question is altered as it passes through an administrative assistant or research assistant. An intermediary may not know why information is needed or the full ramifications of the project. Archivists can give much better service talking directly to the person with the question. In organizational archives, speaking to the actual user, often higher in the organizational chart, is an important means for advocating for the archives.

a series arranged by name, the researcher must have the names of individuals.

The archivist's response depends in large measure on the level of description and the types of finding aids available. Sometimes the archivist identifies terms for searching catalogs and databases. For other queries the archivist identifies likely record groups and series. In other cases, the archivist locates and explains the use of finding aids.

The resolution stage of question negotiation is particularly important in institutional archives. The archivist translates a question about a subject into a question about the related organizational functions. Knowledge of institutional history is necessary to ascertain which agencies were responsible for those functions in the period under investigation and likely to have recorded the needed information. The archivist also uses knowledge of the forms in which information was recorded to infer which series might bear on the subject, to suggest, for example, that

annual reports will be more fruitful than minutes. To refer users to relevant information sources outside the repository, archivists may also use national reference sources and their knowledge of holdings of other repositories or of records retained by creating departments within the parent organization.

Locating information in archives is often inferential, based on what is known about the records, their creators, and the circumstances of their creation. Reference archivists link subject queries to the records and the functions that created them, extending the user's information seeking in the creating organization into the past. Archivists play a vital role in this process because of their understanding of the universe of documentation and how a user's questions fit within that universe.

By explaining their reasoning to users, archivists help researchers build their research skills, to help them understand record creation, finding aids, and the process leading to a particular search strategy. Fig. 6 suggests the complicated relationships among archivists, finding aids, records, and users in resolving questions. Archivists strive to make users as independent as possible by helping them to think archivally—that is, functionally and hierarchically. As teachers, archivists help users to think, "Who would have been likely to record the information I am seeking, how would it have been recorded and filed, and where are the records now?"

Continuing Interaction

In the third, or query refinement stage, interaction between archivist and user continues to refine the problem and search strategy. Research in archives is iterative. As users work through archival materials, they discover new aspects of their topic, including the names of other organizations and individuals whose activities bear on the subject of research.

Researchers also discover questions about records as they work through them. Provenance-related questions, or external evidence, about the source, creation, or custody of records help users judge the authenticity of documents, understand bias or interpretation, or explain gaps in the records. Users also may need technical assistance—deciphering handwriting, identifying archaic words or references, resolving problems with dating, or using difficult file structures. Archivists also may help users understand how best to use formats new to them, such as architectural drawings, photographs, maps, or electronic records.

Exit Interview

Ideally, the reference interaction is closed by an exit interview as long and thorough as the initial interview, but this is seldom realized. Because users do not always announce their departure, it is wise to request and, if possible,

Fig. 6 Inside the black box.

Source: From Pugh.^[1]

schedule an exit interview during the initial interview. Although continuing interaction during research helps to ensure that researchers have seen all pertinent materials, an exit interview provides an opportunity to review the sources used and to discover if additional materials warrant another visit.

The exit interview is an opportunity to capture the knowledge and expertise of researchers and use it to enhance collection descriptions. Researchers often bring, or discover, additional information about collections or creators. An exit interview also is an opportunity to evaluate reference services, assess finding aids, report on arrangement and preservation, or suggest leads for acquisition. Now Web 2.0 interactive finding aids allow researchers to add information to finding aids, and surveys and other tools allow them to evaluate services.

HUMAN DIMENSIONS OF REFERENCE SERVICES

Reference Interactions in Person

All phases of reference interaction—initial interview, continuing assistance, and exit interview—are affected by interpersonal dynamics between user and archivist. Reference encounters in libraries are usually short and voluntary, each devoted to a single question. In contrast, reference transactions in archives are more likely to be substantive, obligatory, and continuing.^[30,31] Because reference archivists frequently mediate among users, finding aids, and records, understanding the human dimension is critical to providing intellectual access to archives. Beyond assisting individual users, reference

archivists also provide services to groups of users and potential users through public programs.

Good communication between users and archivists is critical. Archivists and users may have very different expectations about the reference interaction. Discrepancies in expectations may cause confusion, disappointment, or failure to use archival holdings effectively. Users and archivists may differ in their expectations of the conditions under which archival materials are to be used. Expecting archives to be like libraries, users may feel rebuffed if they cannot be accommodated without an appointment and disappointed that documents do not circulate. Archives must ensure the integrity of unique materials, users may find registration and security procedures intrusive.

Users and archivists may also have different expectations about the appropriate role of the archivist and the amount of time required to locate needed information.^[32,33] Most archivists expect to provide instruction in using finding aids and guidance to records, but users may expect archivists to furnish information directly. Research in archives requires an effective partnership between archivists and users. Archivists strive to make every user feel welcome and to treat all users fairly. Sensitivity, clarity, and a genuine spirit of public service are needed to ensure successful interpersonal relationships in archival reference services. Nonverbal signs and symbols are significant components of interpersonal communication. Positive body language makes users feel more comfortable approaching a staff member with a question.

The first question, the initial inquiry

Reference archivists quickly learn that the first question is usually not the real question, or at least not a full statement

of need. Experienced reference archivists marvel at the gap between what researchers say and what they need. Understanding this gap leads to better reference service. People often feel vulnerable when asking questions, at a psychological disadvantage because they expose need or ignorance to a stranger whose response is unknown. Active listening is more important than talking when the reference archivist seeks to understand the full ramifications of a question or research project.

Another impediment to successful initial interviews may be repository administrative needs. In most repositories, numerous practical matters must be settled before researchers even get to the “first question.” These administrative details can consume considerable time and are likely to be distracting.

Cues for researchers

Researchers need clear cues to identify the reference archivist. Layout and signage can facilitate the interpersonal exchange by making it clear that the reference archivist is to be approached and marking clear pathways to the reference workstation.

Interpersonal dynamics of continuing interaction

If a good relationship is forged during the initial interview, interpersonal communications are less likely to be a problem in continuing interaction and the exit interview. Staff members cannot control the behavior of users, but they do have control over their responses to users. They strive to be pleasant and courteous to all users, regardless of their demeanor. If staff members cannot provide requested information or services, they explain such limitations fully and politely.

Reference Interaction with Remote Users

Off-site users direct inquiries to the archives through letters, telephone calls, electronic mail, and fax.^[34–36] For some users, such inquiries initiate or continue research conducted in person, but for many users they are the sole means of interacting with the repository. Remote inquiries often request archivists to do research for them. Usually archivists have neither the time nor the resources to do so. Policies and priorities must be clearly and convincingly communicated; they must also be reviewed regularly to recognize changing publics, user needs, and technologies.

Reference Services on the Web

Many elements of reference services are moving to the Internet and the World Wide Web, which expand both archival services and researcher expectations. For collecting repositories, information about researcher needs may require assessment of researcher patterns in the

repository, of scholarly networks, and of kindergarten through 12th grade curriculum standards. Collecting repositories can export collection-level descriptions to national bibliographical networks that provide a link in the MARC record to the Web-based finding aid. Analysis of e-mail reference questions can also assist in designing interfaces for electronic information systems.

Web 2.0 tools may enable use of interactive finding aids as a platform for communications.^[37–41] In addition to browsing and searching one or more finding aids, users can create bookmarks and follow link paths of other users. Users can post user profiles and add comments to the finding aid and discuss questions and share information with archivists and other users. Max Evans introduces the concept of “commons-based peer-production” in which users determine the level of intellectual access to archival materials through collaborative tools. Users might add value to the finding aid by identifying, indexing, and digitizing and posting documents, using such tools as Flickr.

Archivists in institutional archives find opportunities through the organizational network electronic information systems to integrate archival information resources into the information ecosystem of the organization. An institutional archives can use the intranet to become a clearinghouse for all organizational information, beyond information about the records it holds. The archives can integrate information about organizational functions, activities, and forms of records, whether paper, visual, audio, or digital, and regardless of whether records are in offices, records center, or archives. The organization chart could be used as an information interface. Better yet, using the business processes or functions of the organization provides a more useful map of the organization. The provenance method of information retrieval can be made explicit and can empower the information seeker.

LEGAL ACCESS

In a narrower sense, access is “the permission to locate and retrieve information for use (consultation or reference) within legally established restrictions of privacy, confidentiality, and security clearance.”^[42] Access in this sense is “Who gets to see what and when.” The repository must face these issues before users request to use records. Access policies are determined in consultation with all interested parties, applying relevant laws, in the context of the mission and resources of the repository and are a foundational document for the repository.

Providing reference services and determining access to records are separate functions, yet they are linked in access policies, first because reference assistance is critical to obtaining access in the broader intellectual sense, and second because reference archivists usually administer physical access and supervise researchers using documents. Reference archivists are responsible

for administering and explaining to users any restrictions on access to records. Access policies are administered, but not determined, at the reference desk.

Records created for personal or internal use may contain private or confidential information that cannot be disseminated immediately. Legal and ethical issues may condition the use of archives: most importantly, privacy, confidentiality, and freedom of information. Archivists strive to provide fair, equitable access to records in their care but must also protect information affecting creators or third parties until it is no longer sensitive. Further, the copyright law, which allows for access to documents, may govern the secondary uses that can be made of them, such as publication.

Archivists have a dual responsibility to the creators and subjects of the records on one hand and to scholarship and the public good on the other. Archivists seek to make as much information as possible available to users as soon as possible, but recognize that some information must be withheld to protect legitimate interests of privacy and confidentiality. Archivists maintain a delicate balance between encouraging use and protecting the rights of creators and third parties. Without some restrictions on access to recent and sensitive materials, individuals may be harmed. Furthermore, without such protection, creators may destroy records rather than transfer them to archives, or they may not record certain kinds of information at all.

Policies for access in its larger intellectual sense and its narrower legal sense must be in place before users actually examine records and obtain information from them. Access policies protect records from harm and some information from premature disclosure, while making as much information available to researchers as possible. An access policy mediates among the competing demands of privacy, confidentiality, public right to know, and equality of access. Some of these concepts are embodied in law, others in deeds of gift, and still others in ethical norms. Access policies also allocate repository resources for reference services as equitably possible. Policies and procedures help the archivist to balance user needs against the staff resources available to meet them while also protecting archival holdings from harm.

Understanding the concepts underlying the laws, regulations, and policies governing access to archival materials is important when designing repository access policies. Four concepts are particularly relevant: privacy, confidentiality, right to know, and equality of access. These guiding concepts are expressed in various forms. The first three are expressed in privacy and freedom of information laws affecting records generated or accumulated by institutions such as federal, state, and local governments, colleges and universities, businesses, and other corporate bodies. Agreements regarding privacy and confidentiality are embodied in contracts in deeds of gift or

transmittal documents. Ethical norms also govern access policies.

Information to be protected is identified and segregated during acquisition and processing, so that the reference archivist does not have to judge the motives or wisdom of individual researchers at the reference desk.

Archivists strive to provide equality of access to repository holdings, although they find they often must educate both records creators and records users about appropriate access to sensitive information. In general, repositories grant access to all users to all materials, with the exception of those covered by law or other restrictions. Insofar as possible, records open to one user are open to all users. No exclusive use of materials is allowed. When interested users approach the repository, archivists strive to treat them equally. Equality of access is now the governing principle for use of records in most repositories.

In addition to advocating equal access for all users, archivists strive to give equal service to all users. Archivists in both archives and manuscript repositories are unlikely, however, to have sufficient resources to be able to serve all users equally and must therefore devise policies to administer reference services fairly. In some settings limitations on services must be acknowledged (Fig. 7).

PHYSICAL ACCESS

Access also means “physical” access, the opportunity to examine documents. To find information in records, someone must consult documents, whether in analog or digital form. Providing physical access means that repositories maintain regular and sufficient hours of operation and provide space to study records.

Most information in archives remains in tangible forms in unique aggregations, although information is increasingly “born digital,” that is, created and maintained in electronic form. Records must be protected from tampering and from accidental or careless damage. The evidential value of archives depends on preserving their integrity, proven through an unbroken line of responsible custody. Archival documents are often unique, and the aggregations of documents in one record group are unique. If the document or the order of documents is lost, it cannot be recovered. Records need physical protection from all types of hazards. Repositories protect records from environmental threats such as fires, floods, and other natural catastrophes, and extend the life of records by creating a stable environment. Archivists protect records while making them available to users.

Planning for security and preservation must be integrated with planning the services to meet users’ needs. Providing physical access primarily means setting administrative policies, but these policies have important consequences for the ability of users to perform their

1. User communities. Identify the communities of users to be served by the repository.
2. Resources and restrictions. State generally the types of records held by the repository. State the types of information that may need to be restricted. Identify applicable laws and institutional information policies that apply to information in the repository, and append them to the policy. Indicate how restrictions will be applied.
3. Intellectual access and reference services. Describe the finding aids, levels of reference services, and the relationship between the two. If necessary, specify distinctions in service levels. Describe searching services, copying services, and services for remote users, whether by phone, email, fax or mail.
4. Fees. Indicate fees for services.
5. Physical access and conditions of use. Describe how records will be made available for research. Include rules for using materials and policy statements for researchers.
6. Use of information. Establish policies to respond to requests for permission to publish from holdings. Indicate forms for citations. Determine terms for staff user of holdings.
7. Loan of materials. Specify conditions under which materials will be loaned.

Fig. 7 Elements of an access policy.
Source: From Pugh.^[1]

work efficiently. The access policy should specify the physical conditions under which research materials may be used.

Further, potential users find it difficult to come to a repository to carry on their research. Archivists must respond to requests from individuals unable to visit personally for information from their holdings and for research services. Remote users request archivists to locate documents, search them, and provide information from them. Policies must address ways of providing information and documents for remote users. It may be necessary to spell out in some detail how much research reference archivists can do for remote users. It is permissible to provide more research time for the parent institution than for other users.

Access for people with disabilities is a matter of public law.

Security

Security is a basic function for all staff members, not just those in reference. Three components interact to provide security for documents: secure storage, description of holdings, and protection of materials while in use. Records are most at risk when they are in active use, and reference archivists or their assistants are generally responsible for ensuring that they are protected during use.^[43]

Preservation

Records also need protection to minimize the wear and tear inherent in handling, copying, loaning, and exhibiting

them. Providing physical access to archives and manuscripts means negotiating a balance among the needs of users, records, and staff. While meeting these needs of current researchers, archivists must also consider those of future users by protecting archives from theft or abuse and from wear and tear.

PROVIDING INFORMATION FROM ARCHIVES: COPIES, DIGITAL SURROGATES, OR LOANS

Copies

Physical access may also be provided through copies and loans. When users begin to use materials, they often request copies of them. Responding to requests for copies is a significant administrative component of reference service. Copying raises questions of technology, preservation, and copyright. To use information found in archives, users note it, copy it, or borrow the documents in which it is found. They request copies for research use, legal use, publication, and exhibition. Individuals also often request information from holdings rather than about holdings. Some requests for such information can be provided by the reference archivist, but most such requests are answered by providing copies.

Digital Surrogates or Electronic Records

Today, copying often means creating digital surrogates disseminated electronically through the Internet or other digital means. Repositories are placing archival documents

online, first in exhibition-like presentations, but more recently, through mass digitization of collections or series of records, mediated through interactive finding aids. “Born digital” documents are also provided electronically.

Loans

Although most archival materials do not circulate, repositories do loan records. The three most common requests for loans are administrative use, research use, and exhibition. Ensuring preservation and security of records are critical to making loans, which are recorded in a loan agreement.^[44–46]

OUTREACH

Reference archivists are integral to outreach programs in their repository. The daily activities of providing reference services profoundly affect public relations. For better or worse, the reference archivist contributes daily to the public perception of the repository and the profession.

Developing Personal Networks in the Parent Organization

For institutional archivists, developing networks of people and constituencies is as important as developing electronic networks. Archivists recognize and build on the information-seeking patterns that staff in organizations use to find information through other people. Developing networks within the parent institution has two important benefits. First, staff members may add the archives to their mental map of information resources and think to call when they have information needs. Second, building such networks reinforces the usefulness of archives; staff will understand why the archival program is important to the organization.

Developing Networks Outside the Parent Institution

Building outside networks is another important aspect of outreach. Archivists should participate in conferences of scholarly associations in relevant subject areas; visit with records creators, donors, and collectors; develop relationships with teachers and faculty; and prepare public programs describing the repository’s records and how they could assist current work.

PUBLIC PROGRAMS

Some users’ needs can be met more effectively through public programs for groups of users than through personal reference interaction.

Managing Reference Services and Evaluating the Use of Archives

To meet users’ needs, protect records, and use staff effectively, repositories organize, administer, and evaluate reference services. Staff qualified to provide reference services must be recruited, trained, supervised, and organized in reporting relationships conducive to meeting user needs. Managing reference services requires planning policies and procedures. Effective management of reference services also depends on measuring and evaluating the use of archives through routine data collection and user studies.

ADMINISTRATIVE COMPONENTS OF REFERENCE SERVICES

Administering the daily tasks of reference services, or managing the staff providing them, may be the most time-consuming aspect of archival reference services. These tasks include receiving, identifying, registering, and orienting users; locating, retrieving, and reshelving materials; and supervising research use, copying, and loans.

ORGANIZING REFERENCE SERVICES

Repositories typically organize reference staff in one of three models: (1) a curatorial organization, in which reference services are integrated with arrangement and description, often in a subject or format area; (2) a rotating organization, in which all staff members take turns providing reference services in rotation; and (3) a functional organization, in which reference services are organized as a separate department. The effectiveness of each of these arrangements depends on the staff, the size and complexity of the holdings, and the nature of the finding aids. In most organizations, the functional model works best, so that reference archivists have a distinct identity, accountable for ensuring service for users and advocating for their needs.

STAFF QUALIFICATIONS

No matter what pattern or combination of patterns is employed, service to users must be the foundation of all archival programs. Reference staff must be capable of meeting both the intellectual and personal needs of users. Archivists have a genuine spirit of public service, but all reference staff must be dedicated to public service, whether professional, paraprofessional, or clerical. A repository’s image is largely shaped by the services provided to users.

Reference staff members must also be knowledgeable about repository finding aids and holdings, understand the organizational history, functions, and record forms of the records creators, and possess or develop subject knowledge of the activities documented by repository holdings. Since appropriate referrals to other information sources are an important element of good service, knowledge of the information universe is also necessary, as is familiarity with general reference tools and online sources. Reference archivists must be familiar with laws and ethics relating to access and copyright.

MANAGING REFERENCE SERVICES

Managing reference services requires planning, establishing reference and access policies, implementing those policies in procedures, and administering these policies and procedures. It also requires advocacy and communication. Planning for reference services should be integrated into repository planning, both for strategic planning and annual planning. Establishing policies for reference services rests on repository policies embodied in the access policy. A procedures manual that outlines the details of reference procedures saves time and helps ensure consistent reference practices.

Time management is difficult, but because of that very difficulty, it is vital. In the research room the time constraints of staff and users intersect and sometimes conflict. No repository can be all things to all users or potential users. Each repository acknowledges its limitations of staff and budget and establishes policies that serve the greatest number in terms of its overall mission. At the same time, the repository can work to identify unmet needs and seek resources to meet them. Priorities must be set as rationally as possible; it is unfair both to users and to reference archivists to make such decisions on an ad hoc basis.

Reference archivists are advocates for the needs of users in repository planning, reporting regularly to repository management on use and user needs. Providing meaningful information to management is necessary to obtain adequate space and equipment, a sufficient number of well-trained staff members, usable finding aids, appropriate public programs, and useful publications. Reference archivists also communicate user needs to other staff members, especially those in technical services and acquisitions.

MEASURING AND EVALUATING THE USE OF ARCHIVES

Archivists measure and evaluate the use of archives at three levels: at the reference function or department, the repository, and the profession.^[47] Evaluating the

effectiveness of the reference function means measuring the uses and users of records. Qualitative assessments of service outputs evaluate such attributes as promptness, thoroughness, courtesy, care, and adequacy of response. Evaluating performance of individual reference staff members requires a set of objectives for reference performance linked to behaviors that can be observed. Meaningful evaluation of reference services compares performance with some standard—either repository objectives or professional standards.

At the repository level, understanding the use of the holdings is necessary to plan descriptive programs, set processing priorities, develop acquisition strategies, and plan public programs. Quantitative and qualitative measures justify the value of archives to resource allocators. Evaluating repository performance requires assessment of such qualitative factors as accessibility, quality of finding aids, comfort, quality of holdings, and accuracy of information provided. Quantitative measures can evaluate timeliness, costs, and other aspects of user satisfaction.^[48]

At the broadest level, understanding and communicating the use of archives contributes to greater public understanding of the value of preserving them and the need to support archival and manuscript repositories.^[49]

CONCLUSION

The archival system is now less predicated on interaction between the user and the archivist. Researchers can directly access finding aids and increasingly locate documents online. Remote inquiries come through e-mail, often from “accidental users,” and are increasing exponentially. Web 2.0 technologies allow researchers to annotate, update, and index archival finding aids, and the next generation finding aid may serve as the basis for a community of learners, including archivists.

Information-seeking behaviors are changing rapidly as information is increasingly “born digital,” recorded in electronic forms, especially in networked environments. A search engine on the World Wide Web may yield a list of archival repositories or archival holdings, available to the public in ways undreamed of a decade ago, but it will list them among hundreds, or thousands, or tens of thousands of sites. Understanding the information needs and research methods of significant users of archives is even more important now as archivists compete for the attention of users.

Perhaps a greater concern is the new popular illusion that all information is available online, especially when this illusion is coupled with the normal consequence of the “Principle of Least Effort.” This combination militates against searching for information that is not online, even though most archival records will remain in analog forms for the foreseeable future. Changing researcher

expectations mean that archivists have to develop innovative ways to connect with them. Although archivists are increasingly linked to users via telecommunication networks, personal networks remain the most important means by which users find archival repositories. Archivists connect with those personal networks to ensure that archives will be on the mental maps of users. Users must think of archives as an information resource.

A reference archivist is a guide not only to finding aids and records, but to the structures and forms of the information landscape of the repository and beyond. The reference archivist is not a barrier, nor a gatekeeper, but rather a partner, a facilitator, and a guide in the joint quest to find meaning in the past to understand the present and plan for the future.

ACKNOWLEDGMENTS

I am grateful to the Society of American Archivists, and Teresa Brinati, Director of Publishing, for allowing me to repurpose text from my book. Elizabeth Yakel, Paul Conway, Kathy Marquis, and Nancy Bartlett provide rigorous, yet always constructive, criticism and stimulate my thinking about reference services. The Bentley Historical Library at the University of Michigan provides an intellectual home.

BIBLIOGRAPHIC ESSAY

These citations offer sources not cited in the notes. Few monographs are devoted to reference services in archives. The first American manual was Sue Holbert, *Archives & Manuscripts: Reference and Access* (Chicago, IL: Society of American Archivists, 1977) followed by the first edition

of Mary Jo Pugh, *Providing Reference Services for Archives and Manuscripts* (Chicago, IL: Society of American Archivists, 1992). The second edition in 2005 has a lengthy bibliographic essay. Hugh Taylor offered a broad overview in *Archival Services and the Concept of the User: A Ramp Study* (Paris: UNESCO, 1984). Haworth Press published two useful collections of essays: Lucille Whalen, Ed. *Reference Services in Archives* (New York: Haworth Press, 1986) and Laura B. Cohen Ed. *Reference Services for Archives and Manuscripts* (New York: Haworth Press, 1997). An excellent summary of reference services in academic repositories that offers models for all settings is Elizabeth Yakel, “Managing Expectations, Expertise, and Effort While Extending Services to Researchers in Academic Archives,” in *College and University Archives*, Christopher J. Prom and Ellen D. Swain, Eds. (Chicago, IL: SAA, 2008, 261–286).

The *American Archivist* published a special section on users and archival research in Volume 66 (Spring/Summer 2003): Helen R. Tibbo, “Primarily history in America: How U.S. historians search for primary materials at the dawn of the digital age,” 9–50; Wendy M. Duff and Catherine A. Johnson, “Where is the list with all the names? Information-seeking behavior of genealogists,” 79–95; and Barbara L. Craig, “Perimeters with fences? Or thresholds with doors? Two views of a border,” 96–101.

Richard Lytle identified and analyzed the two methods of access in “Intellectual access to archives: Provenance and content indexing methods of subject retrieval,” *American Archivist* 43 (Winter 1980): 64–75. Pugh elaborated these insights in “The illusion of omniscience: Subject access and the reference archivist,” *American Archivist* 45 (Winter 1982): 33–44. Elizabeth Yakel argues for a new vision for reference services in the new millennium, particularly stressing the multiple roles organizational archivists might play as knowledge brokers, “Knowledge management: The archivist’s and records manager’s perspective,” *Information Management Journal* 34 (July 2000): 24–30.

Two essays in *Encoded Archival Description on the Internet* (Binghamton, New York: Haworth Press, 2001) assess the impact of EAD on reference services: Richard V. Szary, “Encoded finding aids as a transforming technology in archival reference service,” and Anne J. Gilliland-Swetland, “Popularizing the finding aid: Exporting EAD to enhance online discovery and retrieval in archival information systems by diverse user groups.” Michelle Light and Tom Hyry, “Colophons and annotations: New directions for the finding aid,” *American Archivist* 65 (Fall/Winter 2002): 216–230 suggest that annotations be used to enhance description by reference archivists and users. For further exploration of the potential directions of archival reference services on the Web, see Christopher Prom, “User interactions with electronic finding aids in a controlled setting,” *American Archivist* 67 (Fall/Winter 2004): 234–268, and Richard V. Szary,

“Encoded finding aids as a transforming technology in archival reference service,” in *College and University Archives*, Christopher J. Prom and Ellen D. Swain, Eds. (Chicago, IL: SAA, 2008, 245–260). Elsie Freeman Finch, Ed., *Advocating Archives: An Introduction to Public Relations for Archivists* (Lanham, MD: Scarecrow Press, 1994) provides overviews of outreach in archives.

Navigating Legal Issues in Archives by Menzi Behrnd-Klodt (Chicago, IL: Society of American Archivists, 2008) introduces legal issues. Michel Duchein, *Obstacles to the Access, Use and Transfer of Information from Archives: Ramp Study* (Paris: UNESCO 1983); and Gabrielle Blais, *Access to Archival Records: A Review of Current Issues: A Ramp Study* (Paris: UNESCO 1995) provide international perspectives. Excellent collections of essays are found in *Libraries, Museums, and Archives: Legal Issues and Ethical Challenges in the New Information Era*, Tomas A. Lipinski, Ed. (Lanham, MD: Scarecrow Press, 2002) and *Public Services Issues with Rare and Archival Law Materials*, Michael Widener, Ed. (New York: Haworth Press, 2001). Also useful are *Archives and the Public Good: Accountability and Records in Modern Society* (Westport, CT: Quorum Books, 2002) and Heather

MacNeill, *Without Consent: The Ethics of Disclosing Personal Information in Public Archives* (Lanham, MD: Society of American Archivists and Scarecrow Press, 1992). Peter B. Hirtle, “When works pass into the public domain in the United States: Copyright term for archivists,” posted on-line by Cornell University at http://www.copyright.cornell.edu/Training/Hirtle_Public_Domain.htm, is a useful summary in table form. Also important is his “Archives or assets?” *American Archivist* 66 (Fall/Winter 2003): 235–248, in which he challenges archivists to consider the financial barriers they place in the use of archival resources.

The Society of American Archivists publishes the *American Archivist* (1938–), and the Association of Canadian Archivists publishes *Archivaria* (1975–). The Midwest Archival Conference publishes *Archival Issues*. *Archives and Manuscripts* is published in Australia. Two recent journals are published by commercial presses, *Archival Science* (2001–) and the *Journal of Archival Organization* (2002–). Blogs offer discussion of new trends. Archival Science

Elizabeth Shepherd

Department of Information Studies, University College London, London, U.K.

Abstract

Archival science is the academic and professional discipline concerned with the theory, methodology, and practice of the creation, preservation, and use of records and archives. It encompasses the creation, preservation, and use of records in their functional context, whether organizational or personal, and the wider social, legal, and cultural environment within which records are created and used. In the United Kingdom the discipline is known as archives and records management, although in other cultural contexts, archives management and records management are sometimes separated, and sometimes bound more closely together, for example, by proponents of the records continuum. Organizations and individuals create records in the conduct of their current business, to support administration, to ensure accountability, and for cultural purposes, to meet the needs of society for collective memory and the preservation of individual and community identity and history. This entry serves as an introduction to the field of archival science. The first section gives a broad overview of the nature of archives and records. The main section provides some definitions and an introduction to the core concepts and principles which are central to the discipline, including records, archives, and activities; attributes of records; the records lifecycle; the records continuum; provenance and original order; postmodernist ideas around archive fever. The entry concludes with a discussion of the professional discipline of archives and records management, an overview of the key functions of archives and records services, and a brief history of archival science in the Western world.

INTRODUCTION

Archival science is the academic and professional discipline concerned with the theory, methodology, and practice of the creation, preservation, and use of records and archives. It encompasses the creation, preservation, and use of records in their functional context, whether organizational or personal, and the wider social, legal, and cultural environment within which records are created and used. In the United Kingdom the discipline is known as archives and records management, although in other cultural contexts, archives management and records management are sometimes separated, for example in Germany and in North America, where separate education programs and professional bodies have developed for each subfield. Sometimes archives and records management are bound more closely together than in the United Kingdom, for example, by proponents of the records continuum in Australia. Organizations and individuals create records in the conduct of their current business, to enable actions to be taken and decisions to be made. Records used for business purposes support administration, regulation, public or professional services, economic activity, and dealings between individuals and organizations. Records can be used to ensure accountability, to make people and businesses account for their actions and obligations and when there is a need to prove that organizations have complied with legal or regulatory requirements or recognized best

practice. Records enable organizations to meet legal, regulatory, and financial requirements, and to protect their assets and rights. They help to support the expectations of a democratic society for transparency and they protect citizen's rights. They enable governments to deliver electronically enabled services to citizens (e-government) and facilitate citizen participation through the provision of information and digital interaction. Records support life-long learning, education, and training for people of all ages, from school children to senior citizens. Some records are preserved for posterity as archives, ensuring that they are available for historical, demographic, sociological, medical, scientific, genealogical, or biographical research, for cultural purposes, and to meet the needs of society for collective memory and the preservation of individual and community identities and histories. Increasingly, writers including Andrew Flinn and Sue McKemmish are interested in the role of archives outside traditional organizations and the ways in which archives provide evidence of individuals and communities.

This entry serves as an introduction to the field of archival science and many of the topics which are covered briefly here can be found discussed in more detail in related entries. The first section gives a broad overview of the nature of archives and records. The main section provides some definitions and an introduction to the core concepts, theories, and principles which are central to the discipline, including records, archives, and activities;

attributes of records; the records lifecycle; the records continuum; provenance and original order; postmodernist ideas around archive fever. The entry concludes with an overview of the professional discipline of archives and records management, a discussion of the key functions of archives and records services, and a brief history of archival science.

OVERVIEW OF ARCHIVAL SCIENCE

The Nature of Archives and Records

Archives and records can be created or maintained in any media and format, including paper, parchment, and digital, maps, plans, and technical drawings, volumes and files, photographs and prints, moving images, films, audio and videos, voicemail, other materials such as clinical samples and specimens, Web sites and computer-generated records of all kinds. Records are traditionally text-based but often also contain nontextual material such as sound, images, or three-dimensional objects. Recent literature has challenged some of the more traditional ideas about the nature of the record and its attributes, to encompass ideas of orality, community archives and fluidity. Some writers, such as Terry Cook and Ciaran Trace, emphasize the social context of records creation and suggest that records cannot be neutral: this is supported by the work by Verne Harris in a South African context.

In the traditional view, a record is not defined by its physical format, but rather by its purpose and use. There is significant discussion in the literature about the nature of a record or archive, but a simple definition is that a record is “recorded evidence of an activity” and that archives are those records “recognized as having long-term value.” Extracts from Shepherd and Yeo^[1] used throughout this entry are reproduced with permission of the publisher. Records management is the “field of management responsible for the efficient and systematic control of the creation, receipt, maintenance, use and disposition of records” according to the International Standard.^[2] Archives management is “the selection, preservation, maintenance, arrangement, description and access to materials of continuing value for the long term.”^[3]

CORE CONCEPTS AND THEORIES

Records, Archives, and Activities

If we accept the definition of a record as “recorded evidence of an activity,” we need to understand what an activity is. An activity is “an action or set of actions undertaken by an individual, a group of individuals or a corporate body, or by employees or agents acting on its behalf, and resulting in a definable outcome.”^[1] An

activity has an identifiable starting point in time and also an end point. Some activities, such as drafting and note taking, only involve one party (or actor). In an organizational context most significant activities involve two or more actors: some form of transaction or communication takes place between them. One or more of the actors may be external to the organization (such as a customer or supplier). Other transactions may be purely internal (for example, between a manager and a staff member, or between one department and another). Where more than one party is involved in the activity each party may create its own record; alternatively the second party may receive and retain the record transmitted to it by the creator, while the creator retains a copy of it. Records may be created either in the course of the activity, or afterwards in a conscious act of record keeping. A transaction may be effected in whole or part by the creation or transmission of records such as letters, invoices, or purchase orders. On the other hand, minutes of meetings, staff training records, equipment maintenance records, personal diaries, and the registration of births, marriages, and deaths, are created in order to provide evidence of activities which are already complete.

Records maintained digitally are known as digital records (or electronic records). These terms refer to records created or received digitally which are then maintained in digital form, as opposed to records which are created using word-processing or other software and are then printed out on paper. Such records are sometimes called “born digital,” to distinguish them from paper records which are digitized, i.e., turned into digital images of the original. In most organizations, records are a mixture of formats and media, and include both paper-based and digital records. Most organizations operate hybrid records systems which accommodate records and archives in any medium.

More recently the concept of the record has been extended to include records from different cultures and traditions, including stories, oral records of all kinds, and other cultural objects including dance, song, and painting, which provide evidence of community histories and identities.

Attributes of Records

If a record is to function effectively as “evidence of an activity,” it must be compliant with any external requirements in the environment where the organization operates. Requirements for records may derive from legislation, regulation, mandatory standards, codes of best practice and ethics, or community expectations. Many traditional aspects of fixity in records have now come into question, but a summary of the established view is given here.

Records must possess content, context, and structure. The content of a record must reflect the facts about the activity. For a reliable record these should be accurate (the

facts should be correct) and complete (everything of significance should be recorded). The context of a record must be supported by information about the circumstances in which it was created and used. Records cannot be fully understood without adequate knowledge of the activity which gave rise to them, the wider function of which that activity forms part, and the administrative context, including the identities and roles of the various participants in the activity. Contextual information must be captured in the records themselves or in the systems that are used to maintain them. The structure of records and records systems must reflect the relationships between their constituent parts. In a business letter, for example, there is a formal structural relationship between the details of the addressee, the date, the body of the text divided into paragraphs, and the signature at the end. There are also structural relationships between the individual letters in a file or folder, and between records in a series. The structure of a record forms a link between content and context. Structure organizes the content in such a way as to denote context, and thus contributes to a user's understanding of the record.

Records should also have the qualities of authenticity, integrity, usability, and reliability. The authenticity and integrity of records need to be guaranteed over time, so that users can be confident that records are genuine and trustworthy and that no illicit alterations have been made to them. Records need to be usable: they must be accessible to authorized users and provide sufficient evidence of the context of their creation to support a user's understanding of their significance. Records created within an organization should also be reliable and accurate in their content.

For this to be achieved, records must be created and maintained systematically. Sufficient measures are needed to ensure that records are what they purport to be. If this is not clear the weight of a record as evidence of an activity will be diminished. Records may be destroyed when no longer required, but for as long as they are kept they should remain unaltered. Moreover their usability must be preserved so that they can be retrieved, consulted, and interpreted when they are needed.

Records can be used as sources of information as well as evidence. The information in a textual record may be in the form of raw data (name, address, etc.) or may be derived from narrative. Records typically contain information relating to the parties involved in an activity and to the contents or subject matter of the activity itself, but may also contain information relating to other matters such as the political, organizational, or social environment within which the activity occurred. Users may refer to a record to obtain information of this kind, quite independently of any need to use the record as evidence. Users are also likely to employ other methods of obtaining information, and may not consciously distinguish between records and other information sources.

Archives and records management systems have, therefore, to meet both informational and evidential needs.

Records Lifecycle

The records lifecycle is a concept which is in common use in archival science. It seeks to show that records are not static, but have a life similar to that of biological organisms: they are born, live through youth and old age, and then die. The idea was developed in the 1950s in the United States by T.R. Schellenberg, who wrote about "the life span" of records which included their current use and final destiny.^[4] Since the 1950s many variants on the records lifecycle concept have been developed. Most models aim to show a progression of actions at different times in the life of a record: typically, its creation, capture, storage, use, and disposal. Some writers show this as a linear progression, while others describe a loop or a circle, see Fig. 1.

A different model of the concept suggests that records pass through three ages (or stages), as shown in Fig. 2 a current or active stage, when they are used for business; a semi-current or semi-active stage, when their business value is reduced; and a noncurrent or inactive stage, when they have little or no business value but may be used for secondary, research purposes. Writers who use this version generally also emphasize the physical movement of paper records to alternative storage at each phase of their life, together with the destruction of unwanted records at each stage. There are varying views on where archives fit into this picture, for instance, are they all encompassed within the noncurrent records stage or can archives be identified at other stages in the lifecycle? Records that have continuing significance to the organization, for example, as evidence of its ongoing rights and obligations, can be identified as archives while they are still current.

Fig. 1 "Progression of actions" lifecycle model.

Source: E. Shepherd; G. Yeo.^[1]

Current records are records regularly used for current business of an organisation and which continue to be maintained in their place of origin.

Semicurrent records are records required infrequently for current business which should be transferred from offices to a records centre awaiting their ultimate disposal.

Noncurrent records are records no longer needed for current business.

Fig. 2 “Three ages” lifecycle model.

Source: Adapted from International Council on Archives, *Dictionary of Archival Terminology*, Walne, P., Ed., 1988.

Cultural values can also be identified at an early stage, as well as later.

In the 1980s and 1990s, the lifecycle concept was subject to much adverse criticism. Critics noted that some records do not “die,” but are retained indefinitely because of their continuing value. The division between stages of the lifecycle in the “three ages” model is seen as artificial: for example, records which have been thought to be noncurrent may have a renewed period of currency if the activity which gave birth to them is revived. Lifecycle models do not appear to allow for iteration or repetition of stages or actions, or for stages to be omitted, though in practice this frequently happens. It has also been argued that the lifecycle concept perpetuates an artificial

distinction between records kept for business purposes and records kept for historical or cultural reasons and between the two professions of archivist and records manager. Critics of the lifecycle models also suggest they are too focused on records as physical entities and on operational tasks, especially those associated with the custody of paper records. Digital records rely on logical rather than physical structure, and the tasks associated with the physical storage of paper are largely irrelevant to their management.

Records Continuum

The records continuum concept was developed in the 1980s and 1990s, particularly by academics in Australia. As Fig. 3 shows, managing records is seen as a continuous process. In the continuum there are no separate parts or stages, but one element of the continuum passes seamlessly into another. Dimensions in the continuum are said not to be time-based, but rather represent different perspectives on the management of records. The circles move out from the creation of records of business activities, to ensuring that records are captured as evidence, and to their inclusion in formal systems for records management within the organization; while the fourth dimension looks out toward the needs of society for collective memory. In contrast to the older view that records are kept for organizational purposes during the early stages of their lives, and only later come to meet the needs of a wider society as

Fig. 3 Records continuum model. Copyright F. Upward.

archives, the continuum takes the view that records can function simultaneously as organizational and collective memory from the time of their creation.^[5]

Many archivists and records managers have rejected the lifecycle concept altogether and promote the continuum concept as offering a truer insight. In fact the two concepts may not be incompatible. The continuum is flexible and able to reflect a range of issues surrounding the role of records in contemporary organizations and society. However when planning and executing a program of archives and records management in an organization, formulations based on the lifecycle concept can provide a useful practical framework and can help to identify stages and actions which have to be taken.

Provenance and Original Order

The establishment of public national archives following the French Revolution led to a separation between record keepers in government administration and archivists in national archives. Initially archivists were content to receive records selected by the administration, seeing their role, in a purely custodial light, as the preservation, arrangement, and description of records, and the provision of access to them. For these purposes, archivists developed a coherent body of theory based on the innate characteristics of records, summed up in the principles of provenance and original order. These are called in French, *le respect des fonds*, and in German, *Provenienzprinzip*.

An early coherent explanation of these European principles was given in the Dutch *Manual for the arrangement and description of archives* in 1898 by Samuel Muller, Johan Feith, and Robert Fruin.^[6] They defined archives as “the whole of the written documents, drawings and printed matter, officially received or produced by an administrative body of one of its officials. . .” and said that archives “must be kept carefully separate” and not mixed up with the archives of other creators, thus preserving the principle of provenance. In addition, they said that the arrangement of such archives “must be based on the original organization of the archival collection, which in the main corresponds to the organization of the administrative body that produced it” and not placed into artificial arrangements based on chronology, geography, or subject, which is a statement of the principle of original order.

It is worth noting that at this time the U.K. Public Record Office finding aids were based on subject arrangements rather than on strict archival principles of provenance. For example, Scargill-Bird’s *Guide* appeared in 1891: the 3rd edition in 1908 changed from an alphabetical subject arrangement to one respecting groups and classes. Giuseppi’s *Guide* (begun in 1914 and published in 1923–1924) was more fully provenance-based.

Hilary Jenkinson of the Public Record Office was the author of the first significant U.K. text on archives, *A Manual of Archive Administration* published in 1922.^[7]

Jenkinson stated that the Primary duty of the archivist was to safeguard the archives in his custody and his Secondary duty was to provide for the needs of historians and researchers. Jenkinson subdivided Primary duty into, first, the physical defense (preservation and conservation) and, secondly, the moral defense (unbroken chain of custody, preservation of original order), and stated that “The good Archivist is perhaps the most selfless devotee of Truth the modern world produces.” Jenkinson’s Moral defense embraced his belief that records accumulate naturally as a result of administration and are untainted evidence of acts. They require an unbroken chain of custody to maintain their authenticity. As a result, the archivist should not interfere with the order in which documents were received or with original bindings or filing or undertake appraisal, since the archivist’s role was to keep and not to select archives. Only the administrator could select archives for preservation.

Jenkinson’s understanding of the principles of arrangement were that “the only correct basis of arrangement is exposition of the administrative objects which the archives originally served” and that the archivist should “establish or reestablish the original arrangement.” He noted that the immediate source of acquisition of the archive should not necessarily be regarded as its true provenance and “whatever else we do we must not break up the Archive Group.” In this he adopts the French *respect des fonds*.

These early theories up to 1930s were developed by archivists who worked in national archives mainly with medieval and early modern records from stable administrations. They described archives in order to make them accessible through calendars and lists.

The principles rely on an idea of the fonds, which is the whole of the records, regardless of form or medium, organically created and/or accumulated and used by a particular person, family, or corporate body in the course of the creator’s activities. The fonds, or in English the archive group, is an organic whole, which can be subdivided. One main level of subdivision is the series, that is archives arranged in accordance with a filing system or maintained as a unit because they result from the same accumulation or filing process, or the same activity; have a particular form; or because of some other relationship arising out of their creation, receipt, or use. These levels of description are made manifest in late twentieth century standards for archival description, in particular the International descriptive standard, ISAD(G), which gives general guidance for the preparation of archival descriptions, which themselves identify and explain the context and content of archives.^[8]

Traditionally understood as referring to the administrative origin of records, the term provenance is now often reinterpreted to include an understanding of the functions and activities which underlie records creation and maintenance.

The principle of retaining the original order relates to records in the paper world: it preserves context by

protecting the physical structure of archives, for example, the physical juxtaposition of a record to other records, typically in a file or cabinet. To extend this concept into the digital world, where storage is random and the physical juxtaposition of records has no significance, it is necessary to reinterpret it in terms of the intellectual relationships between one record and another. These long-standing principles are still valid, but postmodernist reinterpretations of provenance include understanding the role of the archivist as a cocreator and wider ideas such as societal provenance, developed in particular by Canadian writers.^[9]

Archive Fever

Philosophers and cultural theorists, such as Derrida, Foucault, structuralist Levi-Strauss, and Ricoeur, in recent decades experienced uncertainty about positivist approaches which fix identities and meaning, and they questioned whether concepts and phenomena have distinctive and unchanging identities and whether it is possible to accept scientifically verifiable facts or truths. Since 1970s various forms of constructivist and relativist thinking, loosely labeled “postmodernism,” have become prevalent. Postmodernist writers commonly argue that there are no meanings independent of human experience, only interpretations which arise within particular social or cultural contexts. They propose legitimate parallel readings of the same concepts, concepts which are not fixed and can vary over time, cultures, and languages. Archivists began to pay attention to the trend in the 1990s, especially after the publication in English of Derrida’s *Archive Fever* in 1996.^[10] Relativism affects how we think of and conceptualize archives and records and the role of archivists. Derrida suggested that the archivist’s role is to do with context and creation of meaning, setting boundaries around context (provenance), and giving title and order through hierarchization (original order). Archival writers, including Terry Cook and Tom Nesmith, suggest that archivists, who create, transmit, keep, arrange, destroy, and use records, are cocreators of the record, and that archival activities are a part of the provenance and context of the record, which is an evolving and not fixed concept.^[11] Archivists may have custody of the record for centuries, far longer than the original creator, and thus shape the record and its provenance more than any other actor. These ideas also raise the issue of the representativeness or diversity of archives.

Key Functions of Archives and Records Services

Most organizations have a need for an archives and records management service to ensure that records and archives are created, preserved, and made accessible to the right people in a timely fashion for agreed purposes. Many larger organizations have a formal archives and records service which employs professional and support

staff to ensure that a quality service is provided. Although there has been recent debate about the nature of an archives and records service in a digital environment, a number of key functions can be identified, which may typically be available.^[1,3]

Organizational analysis and records creation

Records managers and archivists need first to understand the records which are produced, the organizational activities which generate records, and the systems used to control them. In addition, they should have a thorough understanding of the organization itself. To gain this understanding, they must analyze the role and responsibilities of the organization, study its structures and working methods, and discover how these have changed during its life. They also need to identify the broader issues which influence the way the organization operates, including its corporate culture and the interests and expectations of stakeholders both within the organization and externally. The next task is to acquire a deeper understanding of its functions and the activities which are performed to support them, using techniques such as functional and systems analysis. The knowledge gained from these investigations can then be used to assess how each of these factors affects the organization’s needs for evidence and information, and the degree to which its needs are met by the existing records and records systems. The archivist and records manager can then design and implement a program which fits the organization’s requirements.

Much organizational activity leads naturally to the creation of records, but few organizations seek to record everything that they do. Written communications generate records, but most spoken communications leave no record unless a written note is made, and manual and physical tasks can also pass unrecorded. However, new ways of working and new technologies often make it simpler to create records where none were created in the past. With the growth of e-mail, many messages that might once have been verbal are now written; voicemail has made it easier to capture evidence of telephone communications when records are required. Archivists and records managers advise an organization on its records creation strategy, which helps to ensure that records meet the appropriate standards of authenticity, integrity, usability, and reliability, and that they are captured into a secure and effective records system so that these qualities will remain intact over time. Archivists may be responsible for the procedures for identifying records that need to be captured and for managing the systematic capture of records in both paper and digital form.

Appraisal

Appraisal is the process by which an organization identifies its requirements for maintaining records. Records

managers have developed appraisal techniques primarily to support decisions about retention: which records can be destroyed at an early stage, and which merit longer-term or indefinite retention? According to the Australian records management standard, appraisal seeks “to determine which records need to be captured” into a records management system as well as “how long the records need to be kept” (AS 4390.1-1996, clause 8.1).^[12] Appraisal can also be used to support other decisions, such as which records require special measures for protection or security. In an archival context, appraisal helps to determine which records have long-term value and are worthy of permanent preservation as archives. Appraisal decisions must take account of the organization’s requirements for records for business use and accountability. Decisions about retention also acknowledge cultural interests, and the interests of external users, to ensure the preservation of corporate or societal memory. In practice, these wider interests will carry greater weight in some organizations than others. In the private sector, an organization may choose to keep only those records needed for its own purposes. In a democracy, public sector bodies and some private ones can be expected to take a broader view. Appraisal systems need three components: methodologies for making appraisal decisions, documentation of decisions, and operational measures for their implementation. Much theoretical and methodological work has been done on appraisal, from Schellenberg’s taxonomy of values (primary and secondary, evidential and informational), through to macro and functional appraisal approaches developed by Terry Cook and others, which are discussed in the related entry.^[13]

Acquisition

One of the outcomes of appraisal is archival acquisition. Acquisition is the process by which an archives service adds to its holdings by accepting archives as a transfer, donation, loan, or purchase. There are two simple models of archival acquisition. First, by managing the archives of the employing organization (either seamlessly with the records management service or separately from it) in order to document the organization which created them: these are institutional archives. Second, by acquiring archives from outside the employing organization, in order to preserve records about some activity external to the organization that maintains the archives: these are collecting repositories. Collecting repositories generally have an acquisition mandate which is defined by one or more themes, such as a particular geographical area (a region or state), a subject (such as literature or women’s studies), a specific individual, group, event, or era (such as a prime minister or president, trades unions, or a particular war or conflict), the media of the records (such as film archives), or a time period. Many archives services in fact adopt both of these two models alongside each other, combining an

institutional mission with a collecting responsibility. The archivist should publish a clearly defined statement of acquisition policy which indicates the mandate, such as the subject areas within which records are sought and acquired and the media for which storage and access facilities are available. As well as being a reference tool for staff and potential depositors, the acquisition policy makes acceptance or rejection decisions less subjective, it provides a basis for cooperation with other archives services and for future service development. A well-crafted acquisition policy, backed up by an active acquisition strategy, helps to ensure that the archive is diverse and representative of the community it seeks to document.

Preservation

Preservation is a key activity, whether the intention is to maintain records for a short time for business purposes, or permanently as archives. With paper records, the main emphasis is on storing the physical media and protecting them from loss or damage. Digital records require a different approach: the physical carriers are likely to be short-lived, but the records must be maintained over time and probably across several generations of storage media. While preservation of paper records is costly in terms of space occupancy, electronic storage media are compact and relatively inexpensive, but costs are incurred in ensuring that records remain accessible. Older paper and parchment archives may require active intervention from a specialist conservator to ensure their physical preservation. There is a whole separate discipline of preservation management, archival conservation, and materials science which concerns itself with the preservation of archives, and archivists must work closely with their preservation colleagues to plan and implement a preservation strategy and program.

Arrangement and description

Archivists and records managers need to classify and describe records and document the context of their creation, so as to exercise intellectual control over records and facilitate their management and use over time. For records managers, a key element in this is the classification scheme, which provides links (both intellectual and physical) between records which originate from the same activity or from related activities, helps to determine where a record should be placed in a larger aggregation of records, and assists users in retrieving and in interpreting records. In a paper-based system, the classification scheme determines the identity of the file in which each item is housed and the place of each file within the system as a whole. Classification schemes play an equally important role in digital records systems, where paper files do not exist, and in hybrid systems, where paper and digital records exist side by side. Classification schemes are based on an

analysis of functions, processes, and activities and are based on the business activities which generate records. They document the structure of a records system and the relationships between records and the activities which generate them. The archival activity of arrangement and description builds on the descriptive systems devised to manage records while they were in current use. Arrangement is rooted in the archival principles of provenance and original order, referred to earlier in the entry. Archivists usually create a range of finding aids, which might include descriptive catalogs, inventories or lists of each fonds, repository guides which list all the different types of records held by a single archive, subject guides which bring together archives relating to a specific research topic (such as family history or gardening), together with access and index points (which enable a user to ask about a specific person or topic) and authority records which provide contextual or biographical information. Increasingly finding aids are made available online in shared systems and may be cross searched by users. Catalogs or inventories are usually the main hierarchical representation of an archival fonds and are constructed following one or more of the available archival description standards. The key international description standard, ISAD(G) and its supplements, issued by the International Council on Archives, sits alongside national guidelines and rules. These include the *Canadian Rules for Archival Description*, in the United States *Describing Archives: a content standard*, and in the U.K. *Manual of Archival Description*.^[14–16]

Access and use

In order to design effective description and retrieval systems, archivists need an understanding of user requirements and search behaviors, since the purpose of description is to enable users to access archives and records. At the time of their creation, records are normally accessible only to the creator workgroup. When they are captured into a records management system, they normally become more widely accessible. Once they have been designated as having value as archives, and especially when they have been transferred to archival custody, wider access to them needs to be provided, including to users from outside the organization. In countries where citizens have rights of access under freedom of information or other legislation, access requests must be handled by someone with appropriate knowledge of the legal obligations. Increasingly archivists are concerned to provide equality of access for all communities, across different legislative, constitutional and cultural frameworks, seeing access to public archives as a right in a democratic society. Most countries have developed standards for access to archives: for example in the United Kingdom, the Public Services Quality Group published a *Standard for Access to Archives* which helps archivists to think about equity, openness, responsiveness and

effectiveness in their access services and to capture these in a written access policy.^[17] Archives provide reference services, which typically include onsite access to archives and to finding aids and other explanatory and supplementary materials, and online access to digital copies of archives, searchable finding aids of various kinds and other services. Archives services increasingly engage in other advocacy and outreach activities. Archives which are visually attractive are a prime resource for marketing and public relations, for instance in advertising or promotional materials. Exhibitions and publications are popular and most archives now have educational programs and online learning resources.

This is necessarily a rather brief overview of the key activities offered by archives and records management services: other entries deal with many of these in much greater detail.

The Professional Discipline

Archival science is a professional discipline and those who practice the discipline to provide archives and records management services are called archivists and records managers. Other job titles include manuscript curator, special collections archivist, access to information manager and data specialist. Archivists and records managers can work in any organizational context. Government agencies and authorities at every level (international, national, federal, county, local, city), universities and schools, hospitals, museums, businesses of every kind including multinational corporations, charities and not-for-profits, professional organizations, families and individuals all create and use records and archives and, potentially, offer work to archivists and records managers. Archives and records management services may form part of library and information services, cultural and leisure services, history and local studies, risk and compliance, access and data privacy, legal and chief executive's department, corporate and facilities services, information and communication technology departments or public relations. Sometimes archives services are administered separately from records management, although within a single organization; some organizations only offer one or the other; and sometimes they are a single seamless service.

Entry to professional work is generally through specialist higher level university education, in many countries at Masters or doctoral level, followed by a period of professional development in post, guided by the requirements of national professional bodies. For instance in the United Kingdom, the normal requirement is for a Masters level qualification (for example, a 1-year M.A. in archives and records management) from a university program recognized by the professional body, the U.K. Society of Archivists, preceded by a period of work experience in an archives or records management service, and followed by a portfolio of achievement for continuing professional

development. In the United States, entry-level positions generally require an undergraduate and a graduate degree. Although archivists take a variety of undergraduate majors, most receive graduate degrees in history or library science, which may include archival courses and a practical work placement. The Society of American Archivists (SAA) is North America's largest national archival professional association. It serves the educational and informational needs of its members and provides leadership to ensure the identification, preservation, and use of records of historical value. The largely separate profession of records management in the United States is supported by ARMA International, a not-for-profit professional association for those interested in managing records and information. ARMA supports the certification process for experienced professionals in records and information management which leads to the Certified Records Manager (CRM). In Canada, the Association of Canadian Archivists (ACA) provides leadership to the archival profession and a number of universities offer Masters level qualifications in archival science. In Australia, the profession is served by both the Records Management Association of Australasia (RMAA) and by the Australian Society of Archivists (ASA).

BRIEF HISTORY OF ARCHIVAL SCIENCE IN THE WESTERN WORLD

This section examines, briefly, some of the key events and issues arising in archives and records development in England, continental Europe, the United States of America, Canada, and Australia. Archives have been created and preserved by literate societies for several millennia, and some writers trace the history of archives back to ancient Babylonian clay tablets and Egyptian papyri.^[18] However, the modern history of archival science is generally agreed to have emerged after the French revolution of 1789 and the Napoleonic period, which resulted in the upheaval of law, administration and government across Europe. After 1794 French citizens were given the right to have access to public archives, which had previously been closed: as Duchein said, "the notion that research in archives was a civic right was increasingly recognized" in Europe.^[19] A shifting of purpose can be seen in many countries, including the Netherlands after 1795, when the "administrative-legal" function was lost and a new "historical-antiquarian" interest emerged. In the nineteenth century, new national archives were established which, Duchein suggests, maintained an historical stance at least initially. These included as the Archivo Historico Nacional in Spain in 1866, the appointment of the first national archivist in the Netherlands in 1802, and the PRO in England in 1838. Duchein identifies two distinct traditions in Europe from this period. The first was in those countries, including Germany and much of

central Europe, which adopted a "registratur" system "by which each administrative document is registered with a registry number corresponding to a methodical schedule known as the Aktenplan." The second tradition emerged in other countries, including France, Belgium, the Netherlands and England, where archivists had to arrange and classify records after their transfer to the archives. This need to classify led to the development of the theoretical debate over the arrangement of archives, initially by subject-based classification schedules which were adopted in France, Prussia, Austria, and England, and then the emergence of the provenance-based approach, especially notable in the Netherlands, which respected the fonds or creating body. The principle of provenance, defined in 1841 by Natalis de Wailly, and respect for original order first articulated in Prussia in 1880, provided the distinctive European approach to archives from the late nineteenth century, and were expressed in the influential texts by the Dutchmen, Muller, Feith, and Fruin in 1898 and by Hilary Jenkinson in 1922.

Although no comprehensive study of the modern development of the archival profession across Europe has been published, there is an emerging body of research into the history of archives and archivists across cultures and in specific countries, mostly unpublished so far, but including studies of the profession in France, England, and in the Netherlands.^[20] In late eighteenth century England, for example, public records were scattered between sixty buildings in London and Westminster. The Record Commission, which was active between 1800 and 1837, reported that "the first and most obvious defect in the present system is that records are deposited in different and widely scattered buildings." It recommended a single central repository for public records and laid the foundations for the Public Record Office Act 1838. In 1851 a new building was begun in Chancery Lane, London to provide a home for the public records, initially records of the courts, but from 1852 including central government department administrative records. A new Public Records Act 1958 made significant changes, including the introduction of the Grigg two-stage appraisal process. The history of the Public Record Office up to 1969 has been comprehensively discussed by John Cantwell, a former Assistant Keeper.^[21,22] In 1869, a Royal Commission for Historical Manuscripts was appointed, initially only for 5 years, to address questions of private records. Its purpose was to identify and describe the records of private individuals and families held in the great country houses. The two bodies, the Public Record Office and the Historical Manuscripts Commission, were independent of each other, although they shared premises and staff for many decades, but they were brought together in an administrative arrangement in 2003 to form The National Archives and are now both housed on a single site in Kew, Surrey. Outside the Public Record Office, local, university, business and specialist archives developed in England during

the twentieth century. The 1880s saw burgeoning interest in local record publications, the foundation of local antiquarian and record societies and a growth in genealogy. The study of local history developed. After the establishment of county council authorities in 1889, a number of different models of local archives provision developed: some justices and clerks of the peace preserved the records of quarter sessions, city and borough authorities maintained their records and public libraries acquired manuscripts alongside printed materials. In a few places, privately run antiquarian and archaeological societies, trusts and museums collected archives in the absence of, or sometimes in conflict with, official bodies. Bedfordshire can claim the earliest established county record office, appointing its Records Committee in 1898 and establishing an archive in 1913, led by G H Fowler. Gradually through the twentieth century, each county area established an archives service which usually preserved the official records of the local government and acquired the records of local churches, families, societies and businesses. Independent university, business and specialist archives also developed in the later twentieth century. In the United Kingdom, there is no single piece of national archives and records legislation. Instead separate legislation regulates the records of various types of institutions (such as central or local government, the established church, manors), and for different jurisdictions within the United Kingdom (Scotland, Northern Ireland, Wales) and responsibility is divided among government departments.

The history of archival science in the United States has been recounted by, among others James O'Toole and Richard Cox.^[23] Their account of the history of archives and the archival profession in the United States referred back to the European (Old World) antecedents and explored the American traditions. They propounded the view, explored by a number of writers, that the American tradition was two-fold: the public archives tradition alongside a historical manuscripts tradition. The historical manuscripts tradition emerged from state historical societies, beginning with Massachusetts in 1791, which collected mainly private papers useful for the study of the past, alongside museum artifacts and other objects. Notable names in this movement included Jared Sparks, the American historian and educator, who edited the letters of George Washington and of Benjamin Franklin. O'Toole and Cox suggest that in the nineteenth century much greater scholarship was devoted to historical manuscripts, while the public records were relatively neglected, kept simply as an adjunct to the current business of government.

The establishment of the Public Archives Commission in 1899 was "a catalyst in the formation of state archives." Gradually, state archives departments were established, starting in 1901 with Alabama: the state archives network was eventually completed in 1978 with New York. The 1930s were the decade of real progress, according to

O'Toole and Cox. In 1933 construction finally began on a building to house federal records and the following year legislation was passed which established the National Archives as an independent federal agency and the first Archivist of the United States, Robert Connor, was appointed. Adopting ideas of provenance from the European writers, American archivists, notably Margaret Cross Norton, Illinois State archivist, and T.R. Schellenberg of the National Archives, developed ideas about the links between record creators and record groups, the administrative value of records and their place in the public archives. These ideas became very influential, not only in the United States.

In the 1950s and 1960s, records management in the United States developed as a distinct activity, driven by the huge increase of records in wartime. The distinctiveness of the new activity was perceived by some to constitute a separate profession. This perception was marked by the separation of the committee concerned with selection and appraisal from the Society of American Archivists to form a new organization, the American Records Management Association (ARMA) in 1956. Standardization of archival description emerged earlier in the United States than in England, perhaps partly as a result of the dominance of manuscript archivists, often working in a library context, in America. American archivists led the way with the publication of U.S. MARC-AMC (Machine Readable Cataloguing—Archival and Manuscripts Control) in the mid-1980s and a decade later, Encoded Archival Description (EAD), based on an international standard markup language (SGML), which allowed archivists to construct searchable finding aids in an online environment. According to O'Toole and Cox, "for all practical purposes, this movement in the direction of standardization resulted in a merger of the distinct public archives and historical manuscripts traditions." It led to the emergence of more unified professional practice, especially in areas such as archival description.

The Canadian archival tradition evolved differently from those in Europe and America. In Canada, government archives preserved not only the official records of the state, but also private and other records which related the history of the area, in a model not dissimilar to English local record offices, except that in Canada, "total archives" were embraced within the official mandate of many publicly funded cultural agencies. Millar suggested that Canadian archives developed in three phases.^[24] In the first phase, the collection and copying of records relating to Canada from many sources was funded by government. The Literary and Historical Society of Quebec, established in 1824, pioneered the work, followed by Nova Scotia in the 1850s. In 1872 Douglas Brymner was appointed to preserve the archives of the Dominion of Canada. The Public Archives Act 1912 enshrined the collecting approach and allowed the Public Archives to acquire "public records, documents and other historical

material of every kind.” During the second phase, 1900 to the 1970s, the growing sense of national identity and the need for the public sector to manage its institutional records meant that many Canadian archivists pursued the preservation of both institutional records and those from private sources: what became known as the “total archives” approach. The appointment of W. Kaye Lamb as Dominion Archivist in 1948 led to the transformation of the archival profession in Canada. In 1967, the Public Archives joined the National Library in a new building, where acquisition programs expanded to include the preservation of film and television archives and machine readable archives. Provincial archives gradually emerged across the country, with institutions in place in all provinces by 1968, although the services offered and the funding to support activities varied widely. Some, but not all, provincial archives had a role in the records management of their province.

The third phase of development, characterized by Millar as running from the late 1970s, saw significant changes. The Canadian Council of Archives was established in 1985 to support the development of a coordinated archival system, including identifying national priorities, facilitating improved communications across regions, and advising on mechanisms for consistent and sustainable funding and support. In 1975, a new Association of Canadian Archivists was established, launching a new scholarly and professional journal, *Archivaria*, and developing plans for archival education in cooperation with a university.

In Australia, soon after federation in 1901, there were proposals to establish a Commonwealth Archives. The Commonwealth Parliament’s Library took an interest and in the 1920s the Commonwealth National Library brought Australian history collections together. In 1917 the Australian War Records Section was established, which developed in 1925 into the Australian War Memorial, with both museum and archival functions. More extensive national archival developments began in the 1940s, with the establishment of the War Archives Committee in 1942 and the appointment of government archivists in half of the Australian states. In 1944, Ian Maclean was appointed as Archives Officer in the Commonwealth National Library, the precursor to the Commonwealth Archives Office, founded in 1961, which finally separated the archives from the national library.

During the 1950s and 1960s, many archivists in Australia were strongly influenced by practices from the United States, partly because of the famous visit by T.R. Schellenberg in 1954, to give the series of lectures which were the basis of his book published in 1956 as *Modern Archives*; another influence was the visit by Ian Maclean to the United States in 1958 to study American practices. The Commonwealth Archives Office became Australian Archives in 1974 and the Commonwealth Archives Act was passed in 1983.

In 1975 the Library Association recommended winding up its Archives Section and setting up an independent Australian Society of Archivists, which took over the publication of the journal, *Archives and Manuscripts*. This marked the Australian archivists’ emancipation from the library profession. It also marked the beginning of the intellectual contributions made by Australian archivists, confirming the importance of the work by Peter Scott on the record series and encouraging research into the changing role of the archivist, the influence of postmodernism on the profession and the development of the records continuum.

Archival Education and Research

In nineteenth century European countries, the potential loss of archival skills of palaeography and diplomatics led to the establishment of specialist independent schools to teach historical sciences: the Scuola del Grande Archivio in Naples in 1811, the Archivische Unterrichtsinstitut in Munich in 1821, and the Ecole des Chartes in Paris, also in 1821. These schools taught archivists as a specialist professional group, generally separately from librarians. In some countries including France from 1850, only graduates from these schools could be employed in the national archives.

In other countries, the history of archival science as an independent academic discipline has a more recent genesis. In the United Kingdom, university teaching of palaeography, librarianship, local history, and diplomatics developed in the period between the two World Wars. These eventually coalesced into archival education in the immediate postwar period when training schools for archivists were established at the Universities of Liverpool and London in 1947, followed by two courses in the University of Wales (Bangor 1954 and Aberystwyth 1955), together with a practical scheme at the Bodleian Library, Oxford, which ran from 1947 to 1980. Most of these universities offered a 1-year graduate program leading to a Diploma in archive studies. The syllabuses typically comprised subjects including palaeography, archaic languages, diplomatics, English constitutional and administrative history, the study of archival materials, and practical work in a repository. For the next 25 years or so a steady stream of classically trained archivists emerged from the remarkably uniform university schools. Later, new programs emerged, such as archives diploma at University College Dublin from 1973 and the Society of Archivists correspondence course (1980–2000). In the 1990s new subjects, such as records management (at the University of Northumbria) and digital preservation (at the University of Glasgow) were offered. The academics teaching these programs were also active in research, although in the early years, research interests were in diplomatics, palaeography, and historical sciences, mainly undertaken by lone scholars. In the 1990s the archives and

records academics began to move from a scholarly, historical approach to research toward a social science model, which enabled research projects and collaborative and cross disciplinary research to develop. In 2008, there were several active research groups in the United Kingdom, with interests as diverse as community archives and identities, digital preservation and humanities computing, the history of archives and records, and records compliance and management.

American archival education developed rather late by European standards, although there had been calls for such education since the early twentieth century. In the 1930s, the Society of American Archivists established a Committee on Training of Archivists to discuss archival education in the wake of the establishment of the National Archives, which created a need for qualified staff. This committee recommended that archivists should be educated in history or political science, together with a practical training in an archive. The National Archives evolved its own training for staff. Most archivists came into the profession through historical studies. In the 1970s some education programs began in American universities, either in history departments where it often became associated with public history programs, or in library schools. Generally, archives studies formed a small part of the curriculum, which was heavily weighted toward the predominant interests of the parent department. The programs usually included an internship or practical experience project and sometimes required a thesis. During the 1970s and 1980s, there were intense debates between library and history programs about the proper place of archival education. In 1977 the Society of American Archivists published graduate education guidelines in an attempt to produce some uniformity in the curriculum for the profession, although these recommendations endorsed the approach of small numbers of credits for archival studies within wider programs of library science or history. By the late 1990s most programs were in information science schools. A growing number of archival educators were appointed in American universities, estimated by Cox to stand at about 30 faculty by the end of the twentieth century. This group of archival academics undertook teaching and research and enabled an academic discipline to develop, through dissemination, publication, and doctoral research, which began to establish a sound knowledge foundation for the archival profession.

Canadian archival education took a different route from its neighbor, the United States. A range of graduate programs focusing on archival studies were established, first at the University of British Columbia (UBC) in 1981 and then at the University of Manitoba in 1991. Other programs included an archival studies specialization in the Library School at the University of Toronto, which expanded into a broader information studies degree, and courses in the oldest library school in Canada, at McGill University in Montreal, which established archival studies

as a distinct part of its information studies curriculum in 2002. Many of the Canadian schools now have strong research programs, including the INTERPARES projects at UBC.

In Australia, the 1970s saw developments in archival education. Since 1963, the University of New South Wales had offered archives options in its Diploma of Librarianship, but no separate archives qualification existed. In 1973, a new Diploma in Archives Administration began. In the 1990s, archival education in Australia developed significantly, with the Records Continuum Research Group at Monash University, in Victoria and the distance learning program offered at Edith Cowan University in Perth. Each offered something quite distinctive to the Australian, and international, educational scene. Extensive research began into records issues, especially by the Monash University research group, which brought leading thinkers together and generated significant research projects, such as the recordkeeping metadata projects. The publications of these researchers marked a distinctive Australian contribution to the profession.

CONCLUSION

This entry serves as an introduction to the field of archival science and many of the topics which are covered briefly here can be found discussed in more detail in related entries. The first section gave a broad overview of the nature of archives and records. The main section provided some definitions and an introduction to the core concepts and principles which are central to the discipline, including records, archives, and activities; attributes of records; the records lifecycle; the records continuum; provenance and original order; postmodernist ideas around archive fever. The entry concluded with an overview of the professional discipline of archives and records management, a discussion of the key functions of archives and records management services, and a brief history of archival science.

National Archives of Australia (NAA), Canberra, Australian Capital Territory, Australia

Abstract

This entry provides an overview and comparative analysis of the varied manifestations and roles of archival institutions across the world. The entry argues, and illustrates by example (many of which are from Australia), that archival institutions are contingent and mutable creations with ever-shifting, always-contested forms and missions that reflect the dynamic nature of human experience, aspiration, and activity. A secondary argument of the entry is that archival institutions are simultaneously reflectors of and active shapers of their time and place—institutions whose form and function change as the dynamics of societal power relations evolve and transform around them.

INTRODUCTION

Common dictionary definitions of “archives” state that they are either places where historical records are kept or the organizations responsible for collecting and storing such documents. Beneath such seemingly simple, straightforward, and innocuous definitions lies a fascinating and far more interesting terrain of complex, contestable and dynamic views of archives and their role in society. It is the aim of this entry to explore this interesting terrain—to dig beneath the deceptively unproblematic conventional static view of archives as being merely “dusty old stuff.” In short, there is much more at stake in archives than might first meet the eye.

One of the features that has characterized all human societies since time immemorial has been an instinct for collective cultural self-preservation. While culture is contestable and ever-evolving, human beings nevertheless like their cultures and cultural achievements and experiences to endure across generations. This cultural persistence is made possible through the preservation of stories, both orally and in writing and through dance, rituals, art, music and performance. The keeping of many of these valuable cultural “records” is fostered and institutionalized in an “archive(s).” The forms, functions, and mandates of archival programs and institutions have varied and continue to vary enormously depending on the nature of the society in which they exist and the objectives of those who own or have control of the archives.

This entry provides an overview and comparative analysis of the varied manifestations and roles of archival institutions across the world. One of the aims of the entry is to illustrate by example, some of which come from international archival history while others come from the author’s Australian context, just what mutable creations archival institutions really are. Recognition of this seemingly obvious fact is argued as a counterpoint to any

tendency that other authors may have to argue in favor of universal laws and immutable truths about the nature of the archival institution. While common themes, objectives, and issues can be identified through such a comparative analysis, the main argument of this entry is that there is no universal law governing the form and mission of archival institutions. All archival institutions fulfill their mission by, as a minimum, controlling and preserving the records that constitute the archive, but the nature of the mission served can and does vary from case to case. The ever-shifting, always-contested form and mission of the archive reflects the dynamic nature of human experience, aspiration, and activity in all its infinitely rich variety.

The secondary aim of this entry is to illustrate not only that all archival programs and institutions are the contingent products of their time and place, but also that they are active shapers of their time and place. In the words of Verne Harris, archives “at once express and are instruments of prevailing relations of power.”^[1] Indeed, as we shall see, it is the nature of the prevailing power relations and the particular roles archives play as contested sites of power struggle that determine the forms and functions of archival programs—forms and functions that can and do change as the dynamics of societal power relations evolve and/or transform around them.

ARCHIVES AND HUMAN IMPULSES: THE INSTITUTIONALIZATION AND PLURALIZATION OF THE RECORD

Records are made as a means of conducting and/or remembering activities. They are created for pragmatic or symbolic purposes—as enablers and evidence of experience and activity, as aids to memory and/or as artifacts. Some of these records are consciously retained for future reference as archives in order to transmit the activity and

experience through time. As authors such as James O'Toole and Sue McKemmish have argued, human beings throughout the ages have demonstrated impulses to save and to bear witness.^[2,3] Human beings are the sum of their memories. The nature of their interaction with other humans, indeed their very identity, is determined by their memories. While all memory is cognitive, literate individuals learn to rely at least to some extent on the written word to document, express, and supplement cognitive processes. In turn, these cognitive processes give meaning to the archives for, as Jacques Derrida says, the archive does not speak for itself—users inscribe their own interpretations into it.^[4]

When these impulses move beyond the purely personal and take on a broader collective or societal purpose the archives so retained take on a more formal character. One manifestation of this phenomenon is that the records can become part of an archival program or institution. This institutionalization of the record, which Derrida calls *domiciliation*, marks the passage of information from the private to a collective domain (p. 2).^[4] For instance, when a novelist decides to offer for sale her personal papers to a publicly funded manuscript collecting program and when that program assesses the papers and agrees that they would constitute a worthwhile addition to its collection, the records are simultaneously institutionalized and made public property. The novelist is acting on an individual impulse to pluralize her private records for the benefit of current and future generations, while the broader community is acting (through its publicly funded manuscript collecting program) on an impulse to preserve and provide public access to the evidence of a novelist's creative processes and private life.

There are a wide variety of reasons why records may be institutionalized in this way:

- Organizations need to retain their archives in order to meet their legal obligations, to protect and advance their rights and entitlements, and to retain corporate memory of the decisions and activities of the collective over time to support future decision making and organizational continuity.
- Communities, including entire nations, retain archives as a means of remembering and connecting with their pasts, their origins. There are many complex and subtle variations driving this kind of institutionalization of memory. Eric Ketelaar describes archives in this sense as “time machines”—“a bridge to yesteryear.”^[5] Others describe the need to capture and retain ancestral voices or to listen to the whispers of the souls of long ago.^[6,7] In serving this role archival institutions have much in common with other cultural and memory institutions such as museums.
- Similarly, communities and nations often establish archives to inform, enlighten, educate, and sometimes to entertain. Related to this is the collective need to

support and control storytelling about the pasts and origins of the community. Often archives are retained as a means of expressing, asserting, and preserving a unifying group consensus on the nature of its identity, as forged through a shared history—or alternatively to support competing articulations of group identity and plurality.

- Organizations and communities retain archives for their symbolic significance. Objects stored in the archives can themselves be invested with and convey enormous symbolic significance.^[8,9] The creation of a national archives can be symbolically significant as a form of solidification and memorialization in the context of nation building.^[10] The heavy symbolism of the archives and its contents can in turn cause the archives to be a site of mythmaking and myth perpetuation.^[11] Powerful rulers or administrators often establish archives as symbolic monuments to their own power and as a means of controlling and directing mythmaking activities concerning their achievements. See, for instance, Verne Harris on the role of the South African Archives Service as “an important vehicle for Afrikaaner nationalist historiography, with the legitimization of white rule and the exclusion of oppositional voices being key objectives in the selection policy.”^[12]
- Powerful rulers create archives not only as symbolic monuments to their greatness, but also to legitimize, reinforce, and perpetuate their power. The deeds, treaties, and founding documents in such an archive can legitimize power in a legalistic and evidential sense, while the information on individual subjects and their relationships and activities in such an archive can provide the information such rulers need to control their dominions and perpetuate their power. Moreover, because archives exercise control over selective memory, they are a source of power that is of enormous utility to autocratic rulers. When endeavoring to control the past, deciding what should be forgotten is just as important as deciding what should be remembered. As Antoinette Burton says, “the history of the archive is a history of loss.”^[13]
- Conversely, in democratic societies archives are meant to enable democratic accountability by providing access to the evidence of governance that can empower citizens against potential maladministration, corruption, and autocracy. In addition to, or perhaps instead of, protecting the rights and entitlements of rulers and governments, such archives are meant to protect the rights and entitlements of the governed. In the words of John Fleckner, such archives are bastions of a just society where “individual rights are not time bound and past injustices are reversible,” where “the archival record serves all citizens as a check against a tyrannical government.”^[14]

As it will be seen, these reasons for the existence of archival institutions are not mutually exclusive. Most such

institutions exist for a combination of these reasons. Indeed, many archival institutions struggle either consciously or subconsciously with the ambiguities, complementarities, and contradictions associated with serving these multiple purposes, whether the purposes are served explicitly or implicitly. The ongoing crisis of identity of government archives in democratic countries is a major theme of this entry. Are archives a part of government or a check on it? Do government archives exist to serve the legal and administrative needs of government and/or the people, or do they exist primarily as cultural and memory institutions? How do archival institutions balance the often-competing demands of public and private interests and the differing imperatives of public and private records and their uses? What is the interplay of symbolic roles with these other functions and mandates? Most importantly, what factors influence responses to these dilemmas in practice and what are the consequences of the different responses?

Of course, being brought under the control of an archival institution is not the only form of institutionalization that can be experienced by records. Registrar style arrangements in public administrations, identification by auditors, records commissions and/or documentation programs are all examples of alternative forms of institutionalization, some of which will be explored later in this entry.

INSTITUTIONAL FORM AND FUNCTION SINCE THE DAWN OF TIME

Ernst Posner has argued that the first archives were created by the Sumerians in the middle of the fourth millennium B.C. These records took the form of clay tablets with cuneiform characters. The archives were used to support commercial activity and property ownership. Later ancient societies such as the Hittites, Assyrians, and Mesopotamians all kept archives, although one can only speculate today on just how institutionalized these archives were and what form, if any, such institutions took? In at least some of these societies, archives were kept in temples and courts for religious, legal, administrative, commercial, and genealogical purposes.^[15]

During the second and third millennium B.C. the Egyptians developed an extensive system of archives to support their empire, as did the later Persian Empire. These archives existed primarily to serve the legal, administrative, and military purposes of the rulers. An early indication of the perceived role of archives as tools of political oppression occurred in Egypt around 2200 B.C. when, during a revolt, an angry mob destroyed a records office “as the custodians of hated property rights.”^[15] Persian archives often incorporated the captured archives of defeated governments to help establish control over the newly occupied territories.

Archives in China can be traced back almost as far as the Sumerians. These records were inscribed on bones and tortoise shells for religious, administrative, and symbolic purposes. By 700 B.C. bamboo, silk, and stone tablets were in use, with records of military value being stored in secure buildings. While the Egyptians used papyrus, the Chinese began using plant fiber paper after 200 B.C. The Chinese also demonstrated an early interest in the use of archives to control the writing of history. In the first century A.D. the Han Dynasty established a Bureau of Historiography.

The Greek city-state of Athens began housing its archives in the Metroon, the temple of the mother of the gods next to the courthouse, by around 400 B.C. This archive contained laws, decrees, minutes, financial and diplomatic records, contracts, records of court proceedings, and manuscripts of plays by Sophocles, Euripides, and others. In what was perhaps the first example of an archival institution fulfilling the function of public access to records and consistent with the democratic principles of Athenian government, private citizens could obtain copies of the records in the archives.

The power that resides in the archives is illustrated in the etymology of the word archives, which can be traced to this time. The Greek *archeion* referred to the office of the magistrate or *archon* and the records kept by that office. *Archontes* wielded executive power, which in large part was legitimized by the legal documents in the *archeion*. Similarly, the Greek *arkho* meant to command or govern. The Latin *archivum* was likewise the residence of the magistrate and the place where records of official legal and administrative significance were kept.

Rome's first public archives was founded about 509 B.C. in the Aerarium, or treasury, of the temple of Saturn and housed laws, decrees, reports, and financial records. Like the Metroon, the laws housed in this archives could be consulted by all citizens. When the Aerarium was destroyed by fire in 83 B.C. it was replaced by the Tabularium, a large stone building. In later imperial Rome the Tabularium adopted a narrower mission as the archives of the Senate. It was supplemented by imperial archives and a network of provincial, municipal, military, and religious archives. Various emperors, most notably Justinian I, were keen advocates of archives. The Justinian Code of 529 A.D. was not only written with the assistance of archives, it also included a section on the role of archives and archivists. This code emphasized the importance of archives as a public place of deposit and as guarantors of the integrity and authenticity of the records housed therein.

Most medieval European archives were maintained in ecclesiastical settings, often in “muniment rooms.” By the middle of the sixth century a papal archives had been established. In the eighth century, the Venerable Bede was able to make use of archives to write his landmark history of the church in England. Following the collapse of

the Roman Empire a number of municipal archives persisted in Italy and France until the ninth and tenth centuries. Venice and Florence established archives during the eleventh and thirteenth centuries respectively. It was common practice for royal archives in Europe to have no fixed location, but instead to travel with the King's household. Toward the end of the twelfth century, however, there were some moves toward the establishment of a central government archives in England. A century later Exchequer rolls began to be housed in the Tower of London.^[16] In time, this archives was expanded to include all of Britain's Chancery records. In 1323, the first inventory of English archives was completed and served as a model for similar initiatives elsewhere in western Europe. In 1346, the archives of the kingdom of Aragon were created.^[17]

In 1524, the archives of the crown of Castille was established by Charles V at Simancas near Valladolid. The archive was greatly expanded by Philip II, who regarded archives as vital for controlling, administering, and legitimizing an empire and who also viewed archives as symbols of power and prestige. The Simancas archive is now regarded as the classic prototype of a centralized "national archives." Two hundred years later the Archives of the Indies was established in Seville for the same reasons. When Cortes conquered the Americas, it was considered essential to not only burn the archives of the conquered Incas and Aztecs,^[18] but also ensure legitimate documentation of the occupation by a legally appointed Notary, whose records were eventually deposited in archives back in Spain.^[19] Between the sixteenth and early eighteenth centuries royal archives repositories were established in France, Sweden, Denmark, and China. The combined effect of the advent of the printing press and the emergence of the modern administrative state generated a significant growth in records creation and, as a consequence, archives holdings.

The creation, control, and use of archives became increasingly important in the context of religious, legal, and political power struggles such as the Reformation and parliamentary reform movements, when opposing factions used records to support their arguments. The Renaissance had created demand for access to information for the purpose of supporting scholarly enquiry as opposed to the more common political, financial, legal, administrative, and symbolic purposes. Nevertheless, access to archives was strictly controlled by their owners, usually monarchs or churches, who very often kept them inaccessible to all except themselves and their functionaries.

THE FRENCH REVOLUTION AND THE NINETEENTH CENTURY

The French Revolution provides perhaps the clearest example of the mutable nature and purpose of archives

and their tendency to inspire extremes in human emotion. Between 1789 and 1793, much of the archives of the *Ancien Régime* were attacked and destroyed by mobs or in state-sponsored bonfires and paper recycling campaigns, with the aim of obliterating what the revolutionaries regarded as symbols of their erstwhile oppression. While such actions might sometimes have had the practical benefit of destroying the evidence of feudal debts and obligations, by and large they were cathartic acts of retribution and ritual cleansing of the body politic.

In the midst of this destruction of old archives there coexisted a desire to create new archives, out of which emerged a new archival system for the new society. A legislative repository was provided for by the new Assembly just two weeks after the fall of the Bastille. In September 1790 a law was passed establishing a new National Archives that was to be open to the public and which was to report to the Assembly. By 1794 the desire to destroy the documentary evidence of the *Ancien Régime* had been replaced by a desire to preserve and manage those records as nationalized public property, reinvented for the purpose of symbolically highlighting the glory of the new Republic in contrast to the sinful decadence and oppression of the old regime. A decree issued in June 1794 granted the National Archives jurisdiction over the records of government agencies, provinces, communes, churches, universities, and noble families, thus creating the world's first centrally controlled national archival system. The same decree also proclaimed the right of public access to these records, thus establishing the first modern instance of archives fulfilling a legal role as protectors of the rights and entitlements of the people and as instruments of accountability and transparency in government. The creation of national archives as both symbols of nation building in the midst of turbulent change and ideological—indeed almost mythological—assertions of legitimacy by new orders is a pattern that has been repeated often since. The fate of the archives of the *Ancien Régime* testify to the fact that no archives can assume an eternal mandate—in the words of Judith Panitch, they are forever "subject to the judgment of the society in which they exist."^[19,20]

Another aspect of the impact of the French Revolution on archives is worth exploring at this point. Luciana Duranti has argued that the 1794 decree created for the first time a dichotomy between administrative and historical archives—the distinction between the archives of the Republic and the archives of the *Ancien Régime*. Duranti considers this an unfortunate development in that it represents a usurpation of the administrative and legal functions of archives by social and cultural functions—a usurpation that has echoes in various places and times since the Revolution.^[21] Other commentators, however, beg to differ. Judith Panitch, for instance, argues that in the 1790s the notion of French archives as sites of "historical or cultural scholarship had yet to take hold." While they had acquired the new function of public access for the new purpose of

accountability, their essential role as legal, administrative, and symbolic institutions remained unaltered.^[22]

Nevertheless, Duranti is correct in highlighting the distinction between the administrative/legal and cultural/historical roles of archives—a source of contestation that shall be explored in more detail later—even if the cultural role of French archives did not become apparent until some decades after the Revolution. Duranti's portrayal of one role as being innately superior to another is, however, a position that is far more difficult to sustain, as we shall see. Nor, as we have already seen, is it true that the world had to wait until the late eighteenth century to witness an example of an archives that was established for cultural and historical purposes. While such phenomena were indeed unusual, they were not unprecedented—see for example the case of the Han Dynasty Bureau of Historiography referred to above.

The creation of a centralized national archives in France provided a model for archival development in a number of other countries such as Finland, Norway, the Netherlands, and Belgium during the nineteenth century. Similarly, in Sweden, Denmark, and Prussia central archives evolved out of pre-existing royal or administrative repositories. Forty eight years after the creation of the French national archives, the English followed suit, but for very different reasons and in much less dramatic circumstances. Between 1800 and 1837 a variety of committees and commissions of inquiry had highlighted the scattered and poorly controlled and preserved state of public records in that country. These efforts culminated in the passage of the Public Records Act in 1838 and the eventual establishment of the Public Record Office during the 1850s by a government that was concerned to ensure the proper care and preservation of records that guaranteed the legal rights and entitlements of English people. Lawmakers in Westminster were no doubt aware of the fact that their counterparts in Scotland had beaten not only themselves but also the French in establishing a national archives, when the principal collection of Scottish public records had been assembled in Edinburgh's General Register House as early as 1784.

By the middle of the nineteenth century the growth in historical scholarship based on the use of written sources was becoming an important factor in the evolution of European archival institutions. Selected series of historical documents were published, such as the "Roll Series" and the "Calendars of State Papers" in England. In 1869, the Historical Manuscripts Commission was established in the United Kingdom to identify, describe, and promote the preservation and use of significant historical records that were not otherwise catered for under the Public Records Act. The Commission, which existed until April 2003 when it was amalgamated with the Public Record Office to form a re-branded National Archives, is probably the best example of a state-sponsored documentation program for the nationally distributed holdings of historically significant private records.

ARCHIVAL INSTITUTIONS IN THE TWENTIETH CENTURY: THE POSTCOLONIAL ERA

Globalization, the spread of modern bureaucracies and the worldwide interest in history and cultural/national identity together provided the impetus for the emergence of archival systems around the world during the twentieth century. Soon after the Bolshevik revolution the Soviet Union established a highly centralized archival system as both a reflection and enabler of centralized state power. In contrast to democratic states, access to archives in totalitarian states was not a guaranteed right of the citizen.

In Asia, Latin America, Africa, and the South Pacific, European colonial powers were responsible for the creation of administrative archives that in turn formed the basis for national archives once independence was achieved.^[23,24] For instance, the National Archives of Malaysia was established in 1957 and was based on the model of the Public Record Office in London.^[25] In Vietnam the French colonial administrators established an Archives in 1917. This was eventually superseded by the State Archives Department in 1962, which in turn was consolidated by the 1982 Decree on the Protection of National Archives Documents. The scope of this decree is, however, limited to government records.^[26] In many such territories archival development has also benefited from a strong precolonial archival tradition. Thailand, which was never colonized by a European power, inherited an impressive system of royal legal/administrative and cultural archives of palm leaf manuscripts and bark paper stretching back many hundreds of years. This system was overlaid with a more western approach, including the adoption of a registry system, during the late nineteenth century. In the early twentieth century records retention schedules were introduced and a National Archives was established in 1952 with responsibility for preserving the historical records of government administration.^[27]

A common feature of archival institutions in the postcolonial developing world is that institutions established with the best of intentions on a European model have often struggled to fulfill expectations in the harsh economic and political reality of independent governance. Just as these emerging nations have struggled to consolidate inherited democratic institutions, so too have inherited archival institutions often failed to establish themselves as robust organic components of the culture and governance of postcolonial societies. (See, for instance, the summary of current issues and developments from the Proceedings of the 9th Conference of the Pacific Regional Branch of the International Council on Archives.)^[28,29] Not only have administrators often been inclined to view archives as at best luxuries and at worst irrelevant western white elephants, but also citizens living in predominantly oral cultures have often been slow to develop attachments with institutions primarily associated

with preservation of the written word for use by western academics.^[30] Indeed, an interesting variant on the traditional archival institutional model in non-Western territories has been the emergence of alternative forms of memory institutionalization such as so-called “keeping places”^[31] and memory institutions that deal primarily with orality in preference to written records.

Archival institutions in these territories are having to develop flexible new conceptions of indigenous knowledge ownership, control, and access in response to a rejection of the inappropriate aspects of Eurocentric archival theory, which support the systematic marginalization and dispossession of the indigenous by dominant global discourses. The more successful of these have been able to demonstrate the potential of archives to support the rediscovery of suppressed cultural identities and the redressing of past injustices.^[32] Indeed, the often-tenuous place of archival institutions in oral societies tells us much about the mutable and contingent nature of such institutions. While many have endeavored to increase their relevance by instituting oral history programs, others argue that such activities fail to comprehend the difficulties involved in converting fluid orality into fixed material custody without destroying the very thing that the archives is trying to capture. In the words of Verne Harris there exists “A reluctance to engage indigenous conceptualizations of orality not as memory waiting to be archived, but as archive already.”^[33,34]

ARCHIVAL INSTITUTIONS IN NORTH AMERICA

Contrary to the more usual pattern of legal/administrative archives gradually acquiring a cultural/historical role (or alternatively being supplemented by the establishment of separate cultural/historical records programs), in North America the primary impetus for the creation of archival institutions were cultural/historical imperatives. The Public Archives of Canada was established in 1872, only 5 years after confederation, following a petition to government by the Quebec Literary and Historical Society. Of particular concern to Canadian historians was the desire to have access to records of Canadian historical interest held in Britain and France. Driving the cultural/historical interest was a perceived need to build national unity and identity through the study of the origins of the Canadian people. Although the Public Archives of Canada lacked both proper facilities and a legislative mandate during its early decades, these shortcomings were rectified in 1906 with the construction of an archives building and in 1912 with the passage of archival legislation. This legislation was informed exclusively by the need to preserve records for historical rather than for legal/administrative purposes.

From its outset the Canadian archival endeavor encompassed both public and private records, a concept later articulated as “total archives.”^[35,36] The total archives

concept reflects a long-standing social consensus that public funds should be used to preserve a wide range of Canadian documentary heritage, regardless of its origins and format, and that this preservation effort should be pursued via a planned national system. As a result Canada has not experienced the emergence of separate (and sometimes warring) archival tribes or traditions for public records and historical manuscripts, as has been the case in the United States and Australia. With Canadian national identity constantly at risk of being swamped by the more dominant identity of its southern neighbor, recognition of the need to take coordinated action to preserve something distinctly Canadian has compelled generations of Canadians to take a holistic approach to the preservation and management of their archival heritage. The National Archives of Canada (since 2004, Library and Archives Canada) has, at least in theory, always given equal priority to the preservation of records originating in the private sector and to the preservation of records originating in the public sector. Nevertheless, it was not until the 1950s that the then Public Archives of Canada began to exert authority over public records and perform the legal/administrative role that provided the original basis for its counterpart institutions in Europe.^[37,38]

Like Canada, it was cultural/historical concerns that led to the creation of a national archives in the United States. Unlike Canada, which wasted little time in establishing a central archival program, the United States had to wait until 1934—over 150 years after the Declaration of Independence—before its national archives was established. This represented the culmination of many decades of agitation by historians, most notably the American Historical Association. By that time the desire to rescue, preserve, and provide access to historical records had manifested itself in the emergence of the so-called “historical manuscripts tradition.” This tradition, which dated back to the earliest years of the nation, had been shaped by an antiquarian collecting instinct and had become institutionalized in organizations such as state historical societies and the Library of Congress, where the main focus was the collecting, researching, and publishing of the private papers of prominent individuals.

Why did the United States take so long to establish a national archives? In 1939, Ernst Posner argued that a major contributing factor was American ambivalence, if not hostility, toward state bureaucratic power. So, while manuscript collecting endeavors pursued for scholarly purposes were considered laudable, proposals to create an archival institution as an integral part of the state bureaucracy was something that was regarded, at least subconsciously, with suspicion.^[39] Americans had to wait until the latter part of the twentieth century before there was a clear articulation of the role of archives as guarantors of the democratic rights of citizens and as means of holding public officials to account—a role that, while recognized as an ideal, is yet to be fully realized both in practice and in public perception.

Just as the Public Archives of Canada was established for historical purposes and had to wait until the 1950s to acquire an administrative/legal role, so too the U.S. National Archives had to wait until 1950, with the passage of the Federal Records Act, before it acquired a role as a supporter and enabler of public administration. Public records archivists such as Margaret Cross Norton from Illinois pursued a campaign to articulate and assert an administrative and legal accountability role for archives in the face of the primacy of the historical/cultural role.^[40] While Norton had very good reasons for pursuing these efforts, they had the unfortunate effect of creating a polarization of the American archival community—a polarization that persists to this day in a profession which seems unable to attain a comfortable and balanced view of the dual role of archival institutions.^[41,42]

The American experience highlights in sharp relief the tensions and contradictions that have emerged in the roles of archives worldwide since the nineteenth century and which represent contested ground everywhere. Arguably, the polarization is more pronounced in the United States because there is more at stake. Archives in Europe were initially established for legal and administrative purposes, thus conferring on them a valuable legitimacy in the eyes of government that has enabled them to acquire a cultural/historical role from a position of strength. In contrast, at the time of their establishment American archives had no such legal/administrative legitimacy and have had to struggle ever since to attain such a role and the government support and funding that it could attract. The addition of democratic accountability to the legal/administrative role by proponents such as Margaret Cross Norton merely helped the struggle to work against itself. So, while the general public may be suspicious of the legal/administrative role of archives and supportive of the accountability role, the reverse is very often the case from the perspective of those that control the corridors of power in government. Once again we see the mutable nature of archives and the fact that they are forever subject to the judgment of the societies in which they exist.

PUBLIC RECORDS INSTITUTIONS IN AUSTRALIA

The emergence of archival institutions in Australia mirrors in many respects the experience of the United States. As in the United States, the establishment of government archival authorities was the result of advocacy from historians, with a unique Australian contribution coming from leading librarians. In most jurisdictions the government archives programs started their lives as units within the government research libraries, which themselves inherited control of colonial-era records from heterogeneous administrative locations.^[43,44]

The decision to establish a Commonwealth Government archives was made during World War II, 40 years

after Federation, and was informed primarily by the desire to “ensure the availability of material for the preparation of a history of the war.”^[45,46] The Archives Division was initially located administratively within the Commonwealth Parliamentary Library, later the National Library. Despite these cultural/historical origins, early Commonwealth archivists were heavily influenced by the legal/administrative tradition as embodied in the writing of English archivist Sir Hilary Jenkinson. While this was partly a reflection of the British origins of the Australian bureaucracy, it also reflects the simple fact that Jenkinson provided the only archival handbook in the English language to which neophyte archivists could turn for guidance.^[47,48]

Two North American visitors to Australia exerted a significant subsequent influence on archival development in Australia. T.R. Schellenberg from the U.S. National Archives and W. Kaye Lamb from Canada were both firmly of the historical/cultural tradition. Schellenberg toured Australia in 1954 on a Fulbright Fellowship at the invitation of National Librarian Harold White.^[49] Perhaps Schellenberg’s most enduring legacy in the Australian profession was his philosophy regarding the appraisal of voluminous modern public records. While Schellenberg’s cultural/historical message may have registered well with Harold White, the government archivists themselves were determined to stick to the Jenkinsonian path—a determination that manifested itself in a desire to break free from their cultural/historical roots and what they saw as the ill-informed control of librarians. Doubtless also by this time, the North American debates surrounding the campaign of Margaret Cross Norton were resonating in Australia. Despite their philosophical differences on the role of archival institutions, the local Jenkinsonians nevertheless also found in Schellenberg an ally in their arguments in favor of separation from the Library. A Committee of Inquiry recommended separation of the Archives Division from the Library, influenced partly by the differences between the two professional disciplines and partly by the view that the role of the Archives was to manage government records for the benefit of the government and its departments—a very different role than that asserted by Harold White of building a systematic record of national life and development.^[50]

In 1961, the Commonwealth Archives Office separated from the National Library. The newly independent Office then proceeded to bury itself deep into the Federal bureaucracy and largely turn away from any cultural/historical role—indeed from the rest of the profession in Australia, a situation that persisted into the 1990s. The most positive aspect of this bureaucratic focus was, through the efforts of Ian Maclean and Peter Scott, the development of an innovative and enduring Australian school of thought on the management and intellectual control of current records.^[51–53] Nevertheless, throughout the 1960s and 1970s the Australian Archives, as it became known in

1974, proved to be ambivalent about pursuing an active role in support of democratic accountability in the manner that opinion leaders such as Sir Paul Hasluck and Margaret Cross Norton had advocated. It appeared to define its role solely in terms of supporting the administrative and legal requirements of the Commonwealth Government.^[54,55]

At this time the Government was contemplating the need for legislation to govern the work of the national archives. Canadian Dominion Archivist Kaye Lamb was invited to investigate and recommend a way forward. Lamb's 1973 report was critical of the lack of support and assistance provided to researchers by the Archives and recommended legislation that gave the organization a broad cultural and administrative mandate and a leadership role at the centre of a national archival system.^[56] Lamb's recommendations were eventually enacted in legislation with the passage of the Archives Act in 1983—itsself part of a suite of administrative law reform bills including a Freedom of Information Act. This law created the Archives as a quasi-independent entity with an appointed Advisory Council.

While the advent of legislation gave the Archives a mandate to pursue a range of activities, during the 1980s only those activities relating to a narrowly defined administrative/legal role were pursued with any vigor. Although lack of resources and institutional inertia help explain this situation, changes initiated by George Nichols as Director-General during the 1990s resulted in the Archives pursuing a vibrant and proactive role as both a cultural institution^[58] and an agent of democratic accountability.

In State Government jurisdictions archival institutions have suffered from a variety of malaises including underfunding, lack of public visibility, and control by the sometimes stifling hand of librarians. More recently, however, new public records legislation in a number of jurisdictions has given State and Territory archives greatly enhanced powers as cultural institutions and as semi-independent agents of democratic accountability. In many cases these positive developments have been assisted by spectacular examples of failed public administration, assisted at least in part by a lack of regulation regarding public recordkeeping.^[58–60] Time will tell if the State and Territory Archives are given the resources and the true independence both to reinvent themselves organizationally and pursue their new mandates with the vigor that they deserve.

THE COLLECTING TRADITION IN AUSTRALIA

An Australian equivalent of the Historical Manuscripts Tradition, in the form of a network of State and Commonwealth Government research libraries, was the first to apply serious endeavor to the business of identifying, preserving, and making available valuable archival materials.

These efforts grew out of the antiquarian work of private collectors and historical societies and, until the 1940s were characterized by a desire to preserve documents relating to the origins of European settlement in Australia. The Mitchell Library, opened in Sydney in 1910, was founded on the bequest of the prodigious collector David Scott Mitchell. Similar, though less extensive, collections of personal papers preserved along side other categories of historical source material were subsequently established in State Libraries in each of the other jurisdictions.^[61]

During the 1950s and 1960s there was an almost exponential expansion in the institutional collecting of private archives in Australia. At the forefront of this expansion was the National Library in Canberra,^[62,63] but also significant was the emergence of new collecting programs such as the University of Melbourne Archives^[64] and the Australian National University's Archives of Business and Labour, which have specialized in collecting the records of Australia's leading businesses and trade union organizations.^[65] In large part this expansion reflected a similar expansion in the study and teaching of Australian history in Australia's rapidly expanding university system. According to Stuart Macintyre, the number of full-time professors and lecturers in history in Australian tertiary institutions expanded from fewer than 20 in 1939 to more than 700 in 1973.^[66]

The emergence of new collecting programs and the simultaneous expansion and shift in collecting emphasis by the existing programs stemmed from a desire to serve the needs of this expanding researcher clientele. Both phenomena reflected a more self-confident, nationalistic, and prosperous Australia, a nation that was keen to apply the methods of scientific history to the task of understanding and articulating a national identity. There was also continuity between the old amateur collecting paradigm and the new professional, institution-building paradigm. Both types of collecting constituted, in the words of James Clifford, "a form of western subjectivity" and a "crucial process of Western identity formation."^[67] Human beings are storytelling creatures. Every society develops mechanisms for the formation and persistence of collective memory for storytelling purposes. Archives, when they pursue a cultural/historical role, provide one such mechanism that will very often secure and retain the support of the society in which they exist.

Just as the growth of social history, with its commitment to uncovering the lived experience of ordinary people, provided a major boost to the collection and preservation of textual archives, so too did it foster the growth of associated documentation and preservation programs such as oral history, film and sound archives and, more recently, computer data archives. The National Library commenced gathering and preserving sound recordings and transcripts of oral history interviews with prominent Australians during the 1950s as an adjunct to its manuscript collecting program. Initially based on the

Columbia University model of an oral history program, the Library's efforts have since expanded to encompass thematic social history projects such as the history of the timber industry and documentation of the HIV/AIDS epidemic. The Library's oral history holdings now include some 30,000 hr of original recordings. The program also incorporates a component of field recordings of folkloric tales and music, similar to that pioneered by the U.S. Library of Congress.^[68] Over 400 similar, though much smaller, oral history collections have been established in libraries and archives such as the Northern Territory Archives Service.^[69,70]

The National Library also pioneered the collecting of another category of Australia's documentary heritage in the form of films and sound recordings. As early as 1935 the Library established (as a result of a Cabinet decision) a "National Historical Film and Speaking Record Library." After some years of lobbying by the film and sound industry and others, the National Film Archive and Sound Recording Section were eventually separated from the Library in 1984 as a new institution called the National Film and Sound Archive (NFSA), with its headquarters in Canberra. Although it currently lacks a strong legislative mandate and the kind of bureaucratic independence that is enjoyed by both the National Library and the National Archives, the NFSA enjoys a solid international reputation for professional excellence in the field of film and sound preservation and is an active participant in international professional forums such as the International Association of Sound Archives (IASA) and the International Federation of Film Archives (FIAF). For the most part the NFSA restricts its collecting activity to the output of the Australian private sector media industries, with the various public records archives in each jurisdiction being responsible for the control and preservation of archival value audio visual records produced in the public sector.^[71-74]

Another strand in the collecting archives scene can be found in the area of data archives. The leading archive of this type in Australia, the Social Science Data Archives, was established at the Australian National University in 1981. Its brief is to collect, preserve, and make available for use computer readable data and statistical sets emanating from social, political, and economic research projects in the disciplines of the social sciences. The creators and depositors of these data sets include academics, government and private organizations, and individuals. Such initiatives are consistent with an international tradition of data archiving in the sciences and social sciences, as represented by the activities of the International Federation of Data Organisations and institutions such as the U.K. Data Archive, based at the University of Essex. In recent years data archives have made great use of the World Wide Web to help identify and disseminate qualitative and quantitative statistical data sets for secondary use research and learning.

Unlike their public records counterparts, collecting archives programs have been little troubled by existential dilemmas caused by the need to either combine or choose between the often conflicting roles of supporting a bureaucracy, enabling democratic accountability and supporting cultural/historical endeavor. The collecting archives' sole *raison d'être* is a cultural/historical one. In this, they have much in common with museums, which are themselves significant players in the collecting and preserving of archival materials in Australia.^[75] For instance, one of the country's best known museums, the Australian War Memorial in Canberra, also acts as a collecting archive and as a repository of Commonwealth records relating to Australia's various military endeavors.^[76]

The expansion in funding for archival collecting activities during the 1950s and 1960s provides ample evidence of the value Australian society placed on the pursuit of their role of documenting society by means of collecting.^[77] Today the funding and relative fortunes of the collecting programs may not appear as impressive as they were during this earlier period of rapid growth. This is in part a reflection of declining support for academic history coupled with changes in historiographical philosophy, which nowadays places less emphasis on finding "truth" in source documents. Certainly the quantity of holdings, in terms of items and shelf meters, in Australia's various collecting archives today is dwarfed by that of the public records institutions. Nevertheless, the collecting archives enterprise in Australia today remains impressively robust and continues to enjoy good public support and a reasonable, though sometimes uncertain, level of funding, including the provision of taxation incentives for donors in the form of the Commonwealth Government's Cultural Gifts Program.

In the field of science and technology the work of collecting archives is also complemented by the long-standing contributions of the University of Melbourne's e-Scholarship Research Centre, formerly the Australian Science and Technology Heritage Centre (first established as the Australian Science Archives Project in 1985). This noncollecting archival documentation program locates, identifies, describes, and publicizes significant archival material relating to scientific endeavor in Australia and, when necessary, arranges for the preservation of such records by a suitable collecting organization (see the Center's Website at <http://www.esrc.unimelb.edu.au/>).

The distributed national collection of private records in Australia is, however, not without problems. Graeme Powell has highlighted the lopsided nature of these holdings—the fact that certain areas of activity such as politics and literature are very well represented, while other significant areas of human endeavor in Australia are grossly underrepresented.^[78,79] Doubtless a contributing factor to this is the ad hoc acquisitions policies of the various collecting programs, a problem accentuated by a lack of a

centrally coordinated national archival system,^[80] such as exists in many other countries.

BUSINESS ARCHIVES IN AUSTRALIA

At the beginning of this entry it was argued that many archives combine multiple roles. Good examples of this can be found in Australian business and university archives. Mention has already been made in our examination of collecting archives of the University of Melbourne Archives and the Australian National University's Archives of Business and Labour (now called the Noel Butlin Archives Centre). Both archives were established with the main aim of collecting the records of Australian businesses, primarily to serve the needs of economic historians. In the case of the Australian National University this occurred at the instigation of historian Noel Butlin, while in Melbourne the initiative came from one of the most interesting and significant groups ever to exert an influence on recordkeeping in Australia, the Business Archives Council of Australia (BACA).

BACA was established at the University of Sydney in 1954 and was modeled on the British Records Association. It brought together historians, archivists, librarians, and businessmen with the aim of promoting awareness among the business community of the importance of and methods for preserving valuable business records in order to support the pursuit of business history. Initially the aim of BACA was to encourage good recordkeeping within companies, including the establishment of in-house archives. The collecting of business records by other organizations was very much an afterthought. A Victorian Branch of BACA was established in 1957 at the suggestion of the ubiquitous and indefatigable Harold White. White used his contacts with senior Melbourne librarians, history professors, and captains of industry to assemble a formidable alliance of business archives advocates. Inevitably, White was attracted to this endeavor by the prospect of eventually enriching the National Library's collection with the records of some of Australia's leading businesses. This collecting aim was, however, a longer term objective. To achieve that objective White recognized that the collecting archives had to both establish a positive working relationship with the potential donors and also provide immediate assistance to businesses to ensure that the most valuable records were properly identified and managed by their creators in the short term. By emphasizing the business benefits of the latter to his corporate audience White hoped to also achieve the former—a positive working relationship that could lead to later donations of records from the corporate sector.^[81]

The Victorian Branch of BACA was based at the University of Melbourne, where leading historians like John La Nauze and Geoffrey Serle decided that Melbourne should emulate the collecting efforts that Noel Butlin was

energetically pursuing in Canberra. Before long, Harold White found himself in collecting competition with not one, but two university archives. Eventually White agreed that the National Library would leave the collecting of business archives to the universities, but the concession was not granted without a bitter struggle. In the meantime White, Frank Strahan (inaugural University of Melbourne Archivist), and others had pursued a campaign under the auspices of BACA to educate businessmen in the fundamentals of professional records management, using the argument that good recordkeeping is good for business. This was a rare and relatively successful example of archivists with overriding cultural/historical objectives adopting and pursuing objectives associated with supporting the business needs of organizations (pp. 77–85).^[81]

The innovative adoption of a dual historical/administrative role by archivists operating in a private sector records environment proved to be quite successful, especially considering the relatively low level of total resources that constituted the combination of BACA and the two university archives. A survey of the state of Australian business archives conducted by Simon Ville and Grant Fleming in the late 1990s found a remarkably high retention rate of archives of Australia's top companies for the first 60–70 years of the twentieth century—preserved either by in-house archives such as the Archives of Westpac Bank or BHP Billiton or by collecting archives.^[82,83] It is not unreasonable to attribute this success, at least in part, to the work of BACA and the major collecting archives. Sadly, they and others have noted an alarming decrease in the preservation of significant Australian business records dating from the early 1970s after BACA had effectively ceased to operate, a situation that may also reflect a decline in interest in economic history in the tertiary education sector.^[84,85]

EDUCATIONAL AND RELIGIOUS ARCHIVES IN AUSTRALIA

The significance of the role of two university-based collecting archives, the Noel Butlin Archives Centre and the University of Melbourne Archives, has already been discussed in some detail. Similar collecting programs have also been established at university archives in Wollongong and Newcastle and at the University of New England in Armidale and Charles Sturt University in Wagga Wagga, each of which adopt a regional emphasis in their collecting programs.^[86,87] The University of Queensland's Fryer Library has for many years collected records associated with literary endeavor in Australia as, more recently, has the Australian Defence Force Academy's Library in Canberra. These university-based collecting archives are generally the product of the energies of enthusiastic and committed individuals responsible for the creation and

continued existence of collections that relate to their research interests. In theory they exist primarily to support the research and teaching activities of the university concerned, although in practice their continued existence often relies on patronage and is, as a consequence, tenuous.

Equally precarious is the existence of in-house university archives responsible for the universities' own records. While most of Australia's 38 publicly funded universities have records officers and/or records managers, they do not always have an in-house archives. Those in-house archives that do exist find themselves in a variety of structural reporting arrangements, with some reporting to the university librarian and others associated with the administrative/chancellery arm of the university. In many cases the in-house archives that do exist are severely under-resourced. As a result of recent legislative changes in some State jurisdictions, university recordkeeping requirements are now more formally mandated, with the relevant State Archives exercising overall responsibility for setting recordkeeping standards and authorizing the destruction of university records.

Some university archives combine a collecting and an in-house function. Don Boadle has argued that this marriage is not always a successful one, with university administrators and in some cases the archivists themselves being unable to articulate a clear and compelling mission for a unified archival program. Indeed, in some cases it could be argued that the combined function has resulted in an identity crisis that suggests the worst of both worlds rather than the best of both worlds.^[88–90] As with many of their State and Commonwealth Archives colleagues, these archivists have struggled to achieve consensus on the value of simultaneously pursuing legal, administrative, cultural, and accountability roles, much less consensus on how such an integrated vision might actually be pursued and achieved in an environment where support from senior university administrators is often ambivalent at best. Moves toward a national or even State-based strategy in this area will, if past experience is any guide, struggle in the face of the tendency by universities to guard their independence and autonomy with jealousy and vigor.

Finally, there exist a very large number of in-house archival programs in Australia's various independent (nongovernment) schools and religious organizations. These programs are often staffed by part-time and/or volunteer staff and struggle to attain resourcing commensurate with the scope of their operations.^[91] Church archives house records of dioceses, parishes, and/or religious orders. In recent years their work has been thrust into the spotlight because of the role churches played in the now controversial and emotive issues of child migration and the Aboriginal "stolen generations." The access policies of these archives have been greatly tested in the context of the churches coming to terms with their role in these unfortunate episodes of Australian history and their

relationships with aggrieved individuals who were separated from their families and often badly mistreated in the hands of church officials.^[92,93]

ARCHIVES AS A PLACE AND VIRTUAL ARCHIVES

Throughout the ages one of the regularly recurring functions of archival institutions is to provide a secure place for the safekeeping of valuable records to guarantee the ongoing legal authenticity of those records. This is especially common for archives that serve solely or primarily a legal/administrative role, where control and possession of the records is recognized as a source of power. Luciana Duranti has highlighted the importance of this function in archives stretching back to the days of the Justinian Code and the Tabularium in Ancient Rome, while Michel Duchein has identified the same issue as being important to archives in Flanders and Hungary. One of Sir Hilary Jenkinson's more influential contributions to the archival discourse is the related notion of the need to guarantee an uninterrupted transmission of custody from records creator to archival institution—the physical and moral defense of the record. Duranti has argued that when records "cross the archival threshold" they are attested to be authentic and henceforth guaranteed to be preserved as such by an archives that is independent from the records creating office and for which the preservation of the authenticity of its holdings is its *raison d'être*.^[17,94,95]

While this is a common theme in the history of archival institutions, it is not a universal one. Duchein has argued that there are many countries in which the notion has never existed, including France "where the fact of its being preserved in a public archival repository does not give a document any guarantee of authenticity."^[17] Similarly, while the preservation of authenticity is undoubtedly an objective of most collecting/historical archives programs, it cannot be said to be their *raison d'être*. More recently, archivists who agree with Duranti and Jenkinson about the absolute importance of guaranteeing the authenticity of records have disagreed with Duranti's argument that this can only be achieved by means of archival institutions taking physical custody of the records. To these critics adequate control of records to guarantee authenticity in the digital age can be achieved without the need for archives to provide a physical place of safekeeping. In the digital age the very physicality of records is superseded by a virtual concept or "performance" where the idea of a record having a set physical location becomes meaningless. These critics also object to the notion of records crossing an "archival threshold" at some point in time after their creation. They argue that the "archival bond" and subsequent guarantees of authenticity should commence at the point of records creation which, by definition cannot be physically in the archives (See the entry on

“Diplomatics,” p. 1593 for an explanation of the concept of the “archival bond.”). If the archival bond is achieved and guaranteed at the point of records creation the decision when or whether to perform a physical act of custodial transfer to an archives becomes a minor administrative consideration, not a matter of central significance.^[96–99]

Another strand to this topic is the architectural use of archival buildings to make symbolic statements about the role and significance of archives in society. Many archival buildings throughout the ages have architectural features suggestive of solidity, impenetrability, durability, and authority. Indeed, such featurism is so common as to be almost a cliché—something which itself speaks volumes about perceptions of archival institutions. Recent, more imaginative architectural representations of the form and function of archives, such as the Gatineau Preservation Centre in Canada, have attempted to convey an image of archives as “the epitome of liberal-humanist and objective-scientific activity,” but perhaps unwittingly reflect instead the ultimately indeterminate and mutable nature of the archival pursuit.^[100]

One feature of the “archives as a place” debate has been the perhaps naïve assertion by the post-custodialists^[101] that technological change has made it possible, indeed essential, for digital records to be archivally captured, described and controlled in such a way as to guarantee the authenticity and integrity of the records from the instant of creation onwards. A good explanation of post-custodial archival thinking was provided by Terry Cook in 1994 when he said “. . . our traditional focus on caring for the physical things under our institutional custody will be replaced or (at the very least) enhanced by a focus on the context, purpose, intent, interrelationships, functionality, and accountability of the record and especially its creator and its creation processes. All this goes well beyond simple custody, and thus has usefully been termed post-custodial.” Perhaps the closest archivists have yet come to achieving this vision is with the “VERS encapsulated objects” of the Victorian Electronic Records Strategy (VERS).^[102] The fact remains, however, that the assertion remains an unproved—though appealing—hypothesis.

Ultimately, different archives will make their own choices as to how important guarantees of authenticity are and, if they are considered vital, which strategies they feel will give them the best chance of achieving that objective. Certainly, the post-custodialists argue for a more proactive and virtual “archives without walls” as an antidote to the traditional passive custodial view, although there is no reason why a custodial approach could not also be combined with a more proactive role. Jeannette Bastian has recently argued that (distributed) custody and authenticity should not be ends in themselves, but rather means to a more important end—that of facilitating use of the archives by those who stand to benefit from such activity.^[103] As Frank Upward has argued, “the externalities of place are becoming less significant day-by-day . . . the

location of the resources and services will be of no concern to those using them. . . .”^[104]

In the online world the development of virtual archives is not only desirable, but also essential for continued relevance and survival. Users will wish to be assured of authenticity, but will not care less about the existence of or necessity for places of custody. It will be interesting to watch as archival institutions respond to new user expectations of 24-hr online virtual access and the opportunities offered by digitization programs for transforming and democratizing archival access programs.^[105]

CONCLUSION

We have seen how archives in different times and in different places take different forms, pursue different strategies and different combinations of objectives. We have seen that these differences can be explained with reference to the political and cultural environment in which archives exist and the objectives of those who own, control, or are responsible for the existence of the archives. We have seen that archives are not passive, objective, and “neutral repositories of facts,” but rather active and subjective participants in and shapers of political and cultural power relations.^[106] The power to decide which records constitute the archives and, conversely, which records do not, coupled with the power to determine who can have access to the archives are powers that can be used for good or for bad. Usually, they are used by those who control the archives to support and bolster their own political and economic position, views, and mythologies. In democracies, however, there is at least the potential for archives to act as enablers of citizen empowerment and democratic accountability and transparency—a potential that unfortunately remains more latent than actual in most cases. While public records archives in democratic nations should be substantially independent from the executive government of the day, so that they can play a proactive role in ensuring the accountability of that government, most such archives are in fact a part of executive government and enjoy only limited independence. This suggests that the main role of these archives is to serve the legal, administrative, and culture constructing objectives of the government, rather than any truly democratic purpose. Even in democracies, governments do not surrender lightly the power of archival consignment.

We have also seen that the political and social purposes of archives are never eternal. These purposes are always being contested, reconsidered, reinvented, and transformed, reflecting the judgments of and changing power relations in society. This was seen most dramatically as a result of the French Revolution, but there are other notable examples, such as the transformation of archives in post-Apartheid South Africa, in post-Communist Eastern Europe and in post-Colonial Asia and the Pacific. We have also seen that archives that were originally established to serve the narrow

legal, economic, and administrative purposes of a ruling elite can also be transformed and reinvented to serve broader cultural objectives of society—objectives that are themselves eternally subject to contestation and reinvention.^[24,107–110]

The consequences of these lessons depend on your values and perspectives. From this author's perspective the best archives are those that serve broad social, cultural, and democratic accountability purposes. In reality, we have seen that such archives often struggle to emerge from or succeed within a governance environment that does not place high value on such purposes. In more tightly controlled and less democratic environments archives that serve the narrow political, legal, economic, and symbolic objectives of the ruling elite will generally enjoy greater funding, support, and patronage. As we have seen, however, circumstances can change. Any archives are better than no archives and those which today serve a narrow set of power interests may tomorrow be reinvented to serve broader social and democratic interests. The key is for archivists to understand the roles that they play and to remain ever alert and sensitive to the political and social dynamics in which their archives operates. Archivists should always be ready to take advantage of changing circumstances that may permit their archives to serve more pluralistic, socially inclusive, and democratically empowering roles.

Any discussion of the role of archives as enablers of wider democratic transparency and accountability cannot ignore the issue of archival institutions themselves being accountable and transparent. If the archives should help to hold a government accountable, to whom is the archives accountable? The answer should be the wider community. Unfortunately, however, most archives have a long distance still to travel before they can claim to practice what they preach with regard to transparency and accountability for their own politically charged decisions and activities. Too often archives and archivists are guilty of making their decisions behind closed doors and justifying their actions with spurious claims of sacrosanct professionalism and scientific objectivity. The first steps for archives in a democracy to become truly effective enablers of transparency and accountability are for this role to be effectively communicated to and understood by the wider community and for the archives itself to become fully transparent and accountable for its own operations and decisions.

Depending on their social and political circumstances and on their own choices and actions, archives can pursue missions that can either hinder or assist society in being civil, pluralistic, open, just, and democratic.

Archivists and Collecting

Richard J. Cox

School of Computing and Information, University of Pittsburgh, Pittsburgh, Pennsylvania, U.S.A.

Abstract

Archival collecting is seen by archivists in some countries principally within the context of well-established archival appraisal practices and principles. The author argues for a specifically North American approach to collecting, where the notion of collecting has been the strongest, most well-developed, and most debated. However, many traditional aspects of collecting have been and are being challenged.

INTRODUCTION

Archival collecting—the acquisition of organizational records and personal papers for housing, management, and use in archival and historical records repositories—has a long and tangled history. In many cases, archivists equate appraisal, the identification of records with continuing or enduring value, with collecting (and vice versa). Some archivists believe that records do not become archives without the blessing of archivists through an appraisal process or, at the least, the physical housing (by whatever means) within archives and historical manuscripts repositories. Others place records on a continuum, and they equate a record as archival based on a continuing value because of the importance of the warrant or function generating the record. In the midst of this comes the much older idea of collecting, bringing records into centralized repositories for convenience of research use.

These are complicated matters, cutting into cultural, political, professional, and personal concerns. There are differences with archival collecting within American, European, and other nations. Europeans, operating within a more centralized and controlled regime, tend not to think about collecting in the way North Americans approach this matter. In the younger nation of Australia, the collection of personal and private papers has not been a primary emphasis, at least when compared to the focus on institutional and governmental records.^[1] Many archivists on both continents adhere to a view of appraisal advocated more than half a century ago by Hilary Jenkinson, who believed that the creators of records made selection decisions and that this ensured an objectivity that is impossible to achieve by any other means.^[2] That American archivists have stressed more pragmatic ideas about collecting can be seen in the response to the Duranti essay (where she argues for a more theoretical basis) by Boles and Greene.^[3] American archivists, however, have focused on a serendipitous form of collection, as well as more systematic appraisal approaches, reflecting their less regimented national archival system.^[4] Some would argue

that the greatest emphasis, both practical and theoretical, on *collecting* has come from the North Americans, and as a result, this article concentrates on the topic of the archivist and collecting from a distinctly North American perspective.

BASIC DEFINITIONS

Some observers have connected the ability to document the past with the strength of the archival and historical manuscripts repositories that have been formed. In an assessment of how well America was caring for its historical records, Gerald George (then director of the National Historical Publications and Records Commission, the national funding arm of the U.S. National Archives) wrote: “In the ongoing struggle with capricious fortune, the nation’s collective success in documenting its history is directly connected to the strength of archival and historical institutions, the security of their facilities, the scope of their holdings, their ability to provide access, and the aggressiveness of their collecting—or their ability to persuade others to preserve materials accessible to historians.”^[5] The issue of collecting is what this article is about, but the degree of aggression or activity George emphasizes seems to me to be far from the main issue to be worried about. Collecting has played an important role in forming what archivists do, but it has also wrecked havoc with systematic or standardized approaches to the management of archival records.

For the past century, the nature of U.S. archives and historical manuscripts programs that might collect records has remained fairly constant. Fifty years ago, one archivist provided a typology of collecting programs in this fashion: “Basically there are four types of collecting agencies: 1) the private collector; 2) historical agencies devoted to the preservation of research materials—including manuscripts—primarily for cultural or historical purposes; 3) archival agencies serving their own governments, businesses, or organizations; and 4) agencies that combine

both manuscript-collecting and archival functions.”^[6] This aptly describes the nature of archival programs until recently. New types of community and indigenous archives have gained prominence, part of a remarkable international movement.^[7] While such programs are more diverse and greater in number today, they still fall largely within these categories, and just as they did a century ago, there are tensions caused by the existence of these various collecting groups. Some of these tensions are reflected in the newer community and indigenous programs.

In the United States, the development of archives and historical records programs has been connected to two distinct traditions, which have been built around the manner in which they acquire records. The historical manuscripts tradition relates to collecting repositories such as historical societies and colleges and universities. The public archives tradition is connected to the local, state, and federal archives in which records are acquired primarily through regular transfers, usually as part of a records management program.^[8] Even public archives have “collected,” generally in their formative years as they discover older records, deal with the recovery of older records found by agencies, and evaluate records delivered to them unannounced and without any relationship to formal records retention and disposition schedules.^[9] The movement for the U.S. National Archives was largely focused on gathering and centralizing the archives of the nation.^[10–15] Many state governments worked in the early nineteenth century to copy records related to their colonial past in the archives of Europe, constituting a primitive kind of archival collecting.^[16] In addition, most states labored to gather, copy, and preserve their oldest records.^[17] For a long time, one could not find a formal definition of archival “collecting” within the main professional glossary, but it is still the case that the physical acquisition of records is what most archivists have their sights set on. There are definitions for “acquisition” and “acquisition policy,” but there is no formal definition for the idea of collecting.^[18] The expanded Society of American Archivists (SAA) glossary includes a brief entry for “collecting archives,” a slight improvement.^[19] These definitions are remarkably lifeless when considering the dynamic processes of acquiring records, including the personal, psychological, cultural, economic, and other facets making up such processes.

PIONEER COLLECTORS AND COLLECTING

The collecting emphasis in the American archival profession stems substantially from the role of nineteenth-century historical societies in forming the foundation of the modern archives profession. These historical societies were part of a major shifting by Americans to develop a usable past for their young nation, developing in tandem with historical novels, museums, autograph collecting, and other such

activities and trends. One historian even characterized this period as one beset by “documania.”^[20–23] The historical societies were also modeled after English and European organizations that were established in the Renaissance, generally with similar antiquarian and nationalistic motives to their American descendants.^[24] The equating of archives with their collecting has long been associated with nationalism, as in some nations’ war memorials, including not just the erection of monuments but the collecting of records related to the conflict.^[25] It is also the case that the U.S. National Archives appealed to veterans’ groups looking for a means to commemorate their service, especially as recounted in Victor Gondos’ book on Jameson and the National Archives cited earlier.^[10]

It is not accidental, therefore, that the earliest historical societies were established in the first years of the American Republic. The Massachusetts Historical Society was the first historical society, formed in 1791, and it was followed by a few others in the subsequent decades. Between 1820 and 1860, historical societies were established in nearly every hamlet, major urban center, and certainly every state. By the end of the nineteenth century, hundreds of these repositories existed, each generally subscribing to a “collect-everything” mission. As many have pointed out, these were the main protectors of America’s historical records before the advent of government, institutional, and university and college archives. Historical societies often primarily collected to reflect the interests of their board members, and they often acquired items in a highly competitive way. Admittedly these institutions operated long before there was an archival profession, professional standards, and distinctions between the business of libraries and archives, but their highly charged desire to collect everything and anything set a tone that still permeates large sections of the modern archival profession. Despite the fact that we can discern some narrowing in collecting foci by these institutions as they ran out of space, faced increasing competition from other repositories, identified particular constituencies, and hired more professionally trained staff, there is still no question that by any standard their acquisition desires remained broad and sometimes quite eclectic.^[26,27] In some ways, the general American’s intense interest in the past, including collecting, continues today, and it serves as a reminder that archivists, despite training and vocational choice, are part of the general populace as well.^[28]

One of the devices used by these historical societies was the issuance of wanted lists, circulated to individuals and communities in order to advise them of important and valuable archival records and historical manuscripts. The practice continued well into the twentieth century, when organizers of historical pageants often put out calls for historical documents and artifacts.^[29] Beyond such pageants, modern historical societies, such as the Minnesota Historical Society’s issuing of a brief pamphlet in 1951, effectively did the same. This pamphlet carried an age-old

sentiment: “Between the records and those who would destroy stands the collector. He knows that it is impractical or impossible to save everything, for only a fraction of all the records that have been created have enough historical value to warrant the investment of time and money necessary to preserve them. But, out of the mass, the collector must select the essentials, the manuscripts that will insure remembrance of our past.”^[30] In this statement, the collector was the state or local repository; a century ago it would have been *both* institution and individual.

The historical societies served many roles, but it was primarily as a collecting agency—even if somewhat unfocused—that these organizations made their most important contributions to the development of a documentary heritage. For example, long before government archives were established in the early twentieth century, historical societies often acquired public records that might have otherwise been lost due to neglect or willful destruction.^[30] Still, it is also obvious that these organizations at times inflicted damage on public records by removing them from their records context, treating them as isolated personal papers rather than organizational records, and removing the responsibility from governments to care for their archives. In this way, they reflected the activities of earlier English and European collectors who gathered up stray public records, personal papers, artifacts, and other materials in the pursuit of documenting the past for present use while arguing for their more systematic care.^[31]

One of the roles of these historical societies was to acquire printed ephemera and nontraditional record sources. Over a century ago, it was likely that ephemeral material would be swept up just as eagerly as other more substantial records. Many of the most valuable ephemera collections reside in these older institutions. Now archivists are developing methodologies to help them identify criteria for dealing with ephemera and other nontraditional records.^[32] Sometimes what seem to be fairly routine business records take on more useful importance to repositories and society where their research value is recognized beyond their business utility. The obsolete files of publishers and literary agents have become sought after, for example, because of what they reveal about particular writers as well as the publishing industry.^[33] Archival collecting can become messy and undisciplined when missions are set so broadly, even when individual researchers attest to the potential and actual value of such collections. Without some criteria or parameters, the older antiquarian tradition of collection for collecting’s sake becomes the guiding principle. The question remains what has become the primary objective in archival work; it is easy to state an archival mission or mandate but harder to explain it in plain, understandable language. The digital era has opened up new challenges and opportunities for documenting aspects of society and its organizations seemingly unobtainable just a decade ago.^[34] Will collecting continue?

COLLECTING AND THE FORMATION OF THE EARLY MODERN PROFESSION

Acquisition, collecting, appraisal, and selection have long been thought to be critical functions of the modern archival profession. The profession is usually considered to have started in the late nineteenth century in Europe and in the early twentieth century in North America.^[35] German archivist Karl Otto Muller, working as the American archival profession was forming, is considered by some to be the first to state that selection was the primary matter for archivists to resolve, and he argued that “What is not worth preserving, should never be allowed into an archive.” In the years since then, archivists worldwide have developed a variety of models, methods, and mandates for guiding archival appraisal and acquisition, ranging from allowing the records creator to make the decision to elaborate cooperative planning approaches.^[36] Always working against the systematic approach to appraisal and selection have been the more romantic stories of the great collectors, the pursuit of important collections, and the defying of odds in saving significant records and sources. Such stories are often a main attraction for individuals to become professional archivists and manuscripts curators.^[37–39]

The romance of collecting fits well with what occurred during the Second World War. The obsession that is collecting can be seen most dramatically in tragic events in which one people’s misfortunes become an opportunity for another’s collecting.^[40] For centuries, conquering nations have carried off the archives of other nations (when they haven’t destroyed them), although the reasons are often complicated; motivations for destroying a people’s identity are often stronger than those for making a profit or acquiring an object.^[41] The Second World War was particularly troublesome in this regard, as the Nazis carted off art and historical treasures, including many historical manuscripts. These documents and objects came onto the market, and many wound up in the hands of both private collectors and public repositories. In the 1980s and 1990s, as records of the warring nations were declassified and as the generation of Holocaust survivors began to die off, the looting of Europe became more public and controversial with shifting attitudes about events such as the Holocaust.^[42–45] The question as to why it took 50 years for some of these issues to become of sufficient public and media scrutiny is also complicated and has much to do with broader political, nationalistic, ethnic, and cultural events.^[46] The end of the Cold War also has brought new attention to matters such as these, especially with calls for the return of displaced archival treasures.^[47] The increased public scrutiny on the events of the Second World War also brought more intense light on the troublesome aspects of the international trade in antiquities, art, and archives.^[48,49]

SHIFTING NOTIONS OF ARCHIVAL COLLECTING

There have been noteworthy changes in archival collecting in the past half-century in the United States and around the world, some caused by societal developments and others generating from within the profession itself. Philip Mason, a leading labor archivist and archival educator, sees a substantial change after 1950, when “emphasis on elite groups continued to dominate the collecting priorities of established archival institutions but increasingly attention was devoted to new areas.” As Mason sees it,

the major change in the focus of archives came about through the efforts of the newly established archival programs, especially those affiliated with colleges and universities. Unfettered by traditional collecting practices and the free from conservative governing boards, the new archives branched out into new subject fields. Some chose a geographical area or region as their focal point of collecting, whereas others selected a subject theme around which to develop an archives.^[50]

In fact, the origins of many nationally and internationally known repositories developed because of perceived gaps in collecting or due to the need to locate archives and records closer to the researchers.^[51–53] This is a very different emphasis from what propelled such pioneers as Jeremy Belknap (founder of the Massachusetts Historical Society) in the early years of the historical societies; when there were few repositories, researchers resorted to building their own collections, and critical records were viewed as “monuments” in claiming a past for the young nation.^[27]

After a century of the wide-scale founding of state and local historical societies, the twentieth century became a period of more focused collecting by repositories, either to document specific groups or to support the research of scholars.^[54,55] Those programs that did not refocus their collecting efforts often discovered that the financial burden of collecting had become substantial, requiring them to either rethink their mission or to face escalating costs that threatened to put them out of business.^[56] Nonetheless, archivists persistently have collected virtually every type of record representing every discipline, topic, and trend, such as science,^[57] publishing,^[58] law,^[59] ethnic groups,^[60,61] and labor.^[50,62] Most of these collecting areas developed because historians and other scholars identified gaps in or needs for the collecting of sources missing from repositories for their research. While these efforts have often had noteworthy results, they have also contributed to the general randomness of collecting and often minimized more rigorous standards for appraisal in favor of “we better acquire these records just in case they are valuable” or because “they might be of use to some researcher, at some time.” Such views are particularly vulnerable as the future brings immense changes in

records technology, the use of records, and how society understands and approaches such fundamental matters as evidence and information. Within the archival profession, this can be seen in the massive recent writing on the nature of records and record keeping. For citations to the extensive literature on this topic, refer to.^[63–66]

THE FUTURE OF COLLECTING

If anyone wonders where archival collecting might lead, a reading of Thomas Mallon’s fictional article about the National Archives in the year 2099 will inspire thoughts. Archives II, the newer building of the National Archives in College Park, Maryland, has been turned into condos since all the records have been digitized and the space is no longer needed. The National Archives collects artifacts, or as one of the characters in the short story mutters, “junk is the Archives’ business.”^[67] This is a major shift from what has actually occurred in recent years, when there has been evidence of a shift to criteria used by public archivists to the practices of collecting institutions. In general, collecting was driven by the desire to acquire almost anything or to serve the needs of researchers. Meanwhile, public records staff have begun to shift to more critical matters, such as accountability. Some have argued that such matters are also relevant for collecting repositories, such as in environmental issues and political freedom.^[68] Despite two centuries of collecting and continued reflection on what it means to acquire records for archives, archivists and their predecessors have spent little time in gathering data about why people donate records to repositories. This is a fruitful area for research,^[69] as is almost any aspect of archival appraisal and collecting.^[70,71]

While the emphasis of collecting in the nineteenth century was on the papers of individuals and families rather than institutions (and when institutional records that were acquired were treated as personal papers), many believe today that the emphasis has shifted too far to stress government records, especially as they have had to deal with electronic records. Some have even argued that the archivists who collect personal papers have been victims of a “marginalization.”^[1,72,73] Some of these commentators have stressed that the changing record-keeping technologies necessitate the need for both collecting and organizational repositories to cooperate as well as to develop similar approaches to appraising records.^[74] Other archivists have gone even farther with this concern, worrying that the shifts to contending with information (the emphasis of electronic records management) will have archivists forget about the artifacts of record keeping. One archivist contends that archives do not store information but they hold “artifacts in which information inheres.” Archives are, according to such a perspective, like a “documents museum.”^[75] There has also been increasing tension between archivists, who seem to emphasize responsibility

for organizational records, and researchers (especially historians), who worry about where privately created records are being acquired.^[76–79] Such debates indicate that archivists are both worried about what they will be able to collect and whether or not they will be relegated to lesser roles as places to store old and obsolete documents.

COLLECTING INSTITUTIONS AND INDIVIDUAL COLLECTORS

The idea of professional collecting does butt up against the avocation of collecting by private individuals. Despite the connection of collecting to various stages in the history of the archival profession and the formation of a genuine documentary heritage, in the past few decades, there has been increasing tension between private collectors (individuals, not institutions) and the role of repositories from government archives to collecting programs in universities and historical societies. One case involved the state government of North Carolina seeking legal action against an autograph dealer who offered in his catalog records that had been in the state government's hands a long time before.^[80] A famous incident arose in the 1950s regarding a question of ownership (were the manuscripts the property of the federal government, which commissioned the expedition, or of descendants of the explorers?) of the records of the Lewis and Clark expedition to the Pacific Ocean in the early nineteenth century.^[81] Another replevin case in the early 1980s occurred when one repository, the Western Reserve Historical Society, deaccessioned a group of surveyors' drawings and notes related to Louisiana and adjacent states and put the records up for auction. Pursued by the Historic New Orleans Collection, a private repository, and the Louisiana State Museum, a public agency, the state ultimately attempted to seize a portion of the records as having belonged to the government. While the contention that these were public records appeared a bit specious, the various parties managed to reach a compromise whereby the entire collection was acquired by the Historic New Orleans Collection.^[82]

From the archivist's viewpoint, the concept of collecting and ownership is generally very clear: "The archives and institutional collections that are now established have taken the place of the private collector as the major agent for the preservation of our documentary heritage," or "Replevin actions for public archival estrays sustain a historical view and belief that official records belong to the people as represented by their governments."^[83] Private individual collectors have, of course, a very different take on the matter. While private collectors had played a critical role in the nineteenth century, they are now seen with the multitude of established programs as threats to security, access, and other matters.^[84] More recently, archivists have begun to do research revealing

that replevin is a far more complex issue, with many questions and aspects still needing to be resolved.^[85,86]

The tension between private collectors and archival repositories should not be surprising. In many cases, individuals and institutions compete for the same items. Sometimes, collectors use institutions such as libraries as ways of building their own private holdings (as libraries unsuspectingly weed out rare and valuable materials).^[87] Just as often, archival programs acquire the collections of private collectors. This has been more documented in terms of literary collections, such as Watson.^[88] In rare but important cases, private collectors establish important repositories for their collections, blurring the distinction between personal and institutional collecting as professional staffs become involved in the new institutions.^[89] At the very least, many archivists, manuscripts curators, and special collections librarians relished collecting with the same passion as private collectors. University librarian Lawrence Thompson noted that "Strict objectivity, total indifference to partisan issues on the site of collecting, and an unmitigated passion for identifying the truth are the hallmarks of the collector's trade."^[90] Collectors were identified as being both individuals and institutions.

The problems represented in this aspect of collecting are due to how popular the autograph trade has become in an investment hedge—important enough to be featured in articles such as those appearing in *Forbes*.^[91,92] The continuing interest in personal autograph collecting can be seen in the ongoing proliferation of how-to books on the subject.^[93–96] Despite this fascination with autographs, we do not have a good social history of such collecting, but rather we possess isolated studies on autograph albums as genres^[97,98] and the autograph business.^[99] There are no particularly scholarly studies of individual autograph collectors. The journal *Manuscripts*, the publication of the Manuscript Society, an organization dominated by individual collectors and dealers, contains many articles on individual autograph collectors. The rising monetary value of manuscripts also contributes to other problem activities, such as forgery, although the history of forgery is also connected to other developments in record keeping (such as the transition to written records as the primary form of evidence and changing trends in scholarship).^[100,101] Some forgery cases, such as the Hitler diaries debacle or the celebrated case concerning the forgeries of Mormon documents in the 1980s, have become international events and leave no doubt that the primary motive was to make money.^[102–104]

Even today, conflict between the appraisal of government records and the collecting of records exists, evident in litigation concerning the U.S. National Archives' appraisal of FBI records and the maintenance of electronic mail concerning the Iran–Contra affair.^[105,106] Such cases are less problematic than the ethical aspects of collecting. Older versions of the Society of American Archivists' code of ethics suggests that any archives or historical

manuscripts repository ought to have a collecting policy and adequate resources for maintaining the records acquired, work against excessive donor restrictions, use legal documents in making acquisitions, and seek acquisitions in a fair manner.^[107] Most repositories do have these elements in collecting or acquisition policies, but the specter of theft and other problems haunts these repositories and the profession. Again, the more human aspects of collecting often overwhelm the mundane but necessary elements of maintaining archives. Thoughts of publicity or of beating another repository in acquiring a particular collection can lessen the influence of even ethical issues.

Despite the intense discussion and development of new appraisal methods and planning over the past several decades, the fact remains that many collecting programs still acquire the collections of private collectors. Many of the core holdings of historical manuscripts programs are actually private collections later donated to them. The stress between private and institutional collectors is somewhat modified by this relationship. Private collectors often create trends in collecting or have the financial resources to build collections; it is often up to institutional repositories to house them and make them available for researchers.^[108] It is precisely at this intersection between private collector and institutional repository that the most dramatic aspects of the psychological nature of collecting are seen.

THE PSYCHOLOGY OF COLLECTING AND THE COLLECTING IMPULSE

In some cases, archivists have exhibited some of the most blatant desires for collecting as a human and competitive instinct. Howard Gotlieb, a long-time archivist at Boston University and the chaser of records of celebrities and other noteworthies, was described as collecting to preserve a moment in time; thus, he pleads that each member of his ever-growing “family” save every scrap of paper upon which a little or just one single word has been written or typed. He claims that each manuscript or type-script piece of paper is like an irreplaceable painting, as it is the only one extant. Gotlieb is so persnickety about this matter that he, on occasion, sends empty boxes to collectees to use as receptacles for any paper discards that they may have. “We want everything,” explains Gotlieb.^[109]

Such sentiments are supported by the many volumes of memoirs of collectors and dealers who describe the thrill of the chase, ecstasy in finding treasures in dung heaps, and the pleasures associated with outdoing individual and institutional competitors.^[110,111] This is a far cry from those archivists who struggle to understand whether a systematic analysis of organizational records can lead to the type of documentation needed for purposes of organizational memory and future research use. For example, Canadian archivists B. Corbett and E. Frost^[112] examine

whether or not records retention/disposition schedules lead to a fuller archival documentation of government agencies.

Collecting has been connected to all sorts of human instincts and interests from the personal^[113] to societal consumerism.^[114] A significant challenge to the archivist and collecting is the archivist’s impulse to collect. Most archivists remain fearful of the prospect of losing potentially valuable records if they do not step in to save them.^[115] Writing about the more than 1000 human rights organizations in North America, Bruce Montgomery stated that the lack of research about human rights “stems largely from the paucity of archival evidence in research universities and other educational institutions, and illustrates the danger to the historical record when significant materials on leading worldwide social and political movements remain uncollected.”^[116] While some of this stems from personal and psychological impulses to collect, some also extends from the importance of assembling archives in new areas. As an archivist of dance writes,

The emergence of new archives can only offer greater nourishment and benefit to any tradition . . . It is also a fact that the growth of an archive has a direct impact on a community and a country’s sense of self or their personal self-esteem. It is a force which guards its heritage, while at the same time providing educational materials on traditions of the past and customs of the present for its members.^[117]

A part of coming to terms with the psychological dimensions of collecting has been a substantial rethinking of archival appraisal and collecting in the past two decades.

RETHINKING ARCHIVAL APPRAISAL AND COLLECTING

In the 1970s and 1980s, concerns rose on how effective collecting was led by efforts to systematize the development of archival collecting policies. Here is where archival appraisal and collecting approaches crossed over, both hindered by a sense that the records (and other materials) that archivists and manuscripts curators were gathering were inadequate for a full or balanced documentation of society.^[118] There was some borrowing from librarians’ experience with the development of collecting policies, stressing planning, selecting, evaluation, and cooperative activities.^[119] The fullest articulation of what goes into a collecting policy for manuscripts was also developed in this time period, emphasizing a statement of purpose, types of programs supported by the collection, clientele served by the collection, priorities and limitations of the collection, cooperative agreements affecting the policy, resource sharing, deaccessioning, procedures for

supporting the collecting policy, and procedures for monitoring the development of the collection.^[120] By the early 1990s, archivists such as Barbara Craig were stating this about appraisal (and by the implication, acquisition, and collecting): “We do not create the past like an artist creates a work of art; rather we aim to control the past, or more accurately, to control the documentation of the past, like a systems methodizer, balancing aims, objectives, resources and demand.”^[121]

In some ways, the opening salvo in this reconsideration of collecting by archivists was fired by F. Gerald Ham in his 1974 presidential address to the Society of American Archivists. Ham, then state archivist for Wisconsin, lamented that archivists and manuscripts collectors seemed to be prey to dealing with the constantly changing foibles of research trends and practices. Ham argued that archivists needed to take the lead by acquiring records that would both support current research and open up new avenues for historical research.^[122] Ham’s eloquent message brought both short-term and long-term responses. Typical of the short-term response was that of Lester Cappon, drawing on 50 years’ experience, who argued that

On the archival edge the archivist as collector is confronted with certain dilemmas, not inherently new in the twentieth century, that are insoluble, to some degree, but open to accommodation. On the one hand, the quantity of certain records demands drastic measures wisely to save and to destroy; on the other hand, the paucity or lack of certain records attributable to telephone communication, tempts him to fill the void by creating records for the service of scholarship.^[123]

The challenges facing archivists in collecting and appraising are, of course, difficult and complicated.

Because of dissatisfaction with what has long seemed to be random or skewed collecting, the decades of the 1970s and 1980s were a time in which archivists devoted considerable attention to developing a system for acquisition. Archivists began to question the usual approaches, by which they sought to appraise records, and this ultimately affected the standard means by which archivists collected. There were some efforts to develop a more objective appraisal process, although the development of models and the use of models differed wildly.^[124] Archival documentation strategies emerged as a model of such an approach, promising to bring together archivists, records creators, and the users of archives into a forum that would support clearer planning and literal collecting.^[125,126] Archival macroappraisal approaches, stressing functions of records creation, also emerged in this period, although they have been more directed to organizational realms such as government and corporations.^[127–129] Since these professional discussions, there has been some contentious debate about the foundation of archival appraisal and acquisition, generally revolving around notions of archival

science versus historical approaches to appraising and collecting.^[130,131] The documentation strategy model or concept (it has been termed various things) was attractive enough that it was discussed as a foundation for documenting certain aspects of society, such as adult education,^[132] higher education,^[133] medicine and health care,^[134] and geographic regions.^[135] While the core ideas of documentation strategy have continued to generate debate,^[136,137] these ideas have deeply influenced the archivist’s means for thinking about their appraisal and collecting approaches.^[138,139]

This transformation of thinking about appraisal and collecting led to a consideration of more standardized approaches and a reevaluation of cherished ideas and values. For a long time, the assumption and practice of collecting records has been to focus on their informational value (i.e., their value beyond the immediate uses to the creators of the records—the evidential value). Some case studies suggest that such distinctions are quite artificial.^[140] On the other hand, some archivists have come to see the degree of use as the only means by which appraisal or acquisition can be effectively evaluated.^[141] At the least, there is some room for connecting archival appraisal, records management scheduling, and the more systematic collecting approaches.^[142]

The most recent move to reconsider archival appraisal generally stemmed from the realization that records were voluminous and increasing in volume, leading to more calls for discipline, restraint, and intelligence in collecting.^[143] As some might argue, as the nature and breadth of records systems increased, appraisal (and collecting) has simply become more difficult.^[144,145] The challenges of volume have been commented on by every archival thinker or theoretician for the past century, however. There must be other motives for such reevaluation. While government records have become subject to reappraisal^[146,147] (the systematic reevaluation of records acquired by archival programs), for example, the records and manuscripts acquired by collecting repositories have not been the topic of such reexamination. Since the notion of reappraisal or deaccessioning surfaced 30 years ago, there still seems to have been little effort to incorporate this approach into repositories. Little research has been done, but what has been done suggests reappraisal and deaccessioning are not being used. An example of such research is Hempe.^[148] Collection analysis (closely related to reappraisal), the systematic reevaluation of holdings against perceived or assumed collecting objectives, has had a mildly better history, with some intense case studies and follow-up examinations.^[149,150] The lack of attention to such analysis suggests the importance of developing careful collecting criteria in the first place and that systematic approaches still have not reinvented the appraisal or collecting practice. It may be other factors that transform the basic archival attitudes toward collecting.

BARRIERS TO COLLECTING

Many problems persist in the modern collecting of personal papers, such as privacy regarding those still living.^[151–153] In fact, personal privacy has become so significant an issue that popular novels have focused on questions about the role of archivists and manuscript collectors in preserving manuscripts that reveal the private lives of public figures.^[154] Life imitates art, as the daughter of writer Bernard Malamud laments anyone having access to her late father's papers, contemplating why such personal papers might be better off destroyed.^[155] Some of these problems have persisted for a long time, such as the recognition of the complicated and laborious relationship between repositories and the donors of archives and manuscripts.^[156] The most famous (or infamous) case was that of access to the Sigmund Freud papers at the Library of Congress, placed on deposit and controlled by Freud disciples.^[157] Such challenges extend beyond the nature of the materials, requiring that hard questions be asked. It is no wonder that many archives and historical manuscripts programs have shied away from confronting (and collecting) controversial topics.^[158]

Those programs that have tried to deal with controversial topics by acquiring the records of such organizations as the Ku Klux Klan have found it difficult to contend with public reaction and media attention.^[159,160] Indeed, we could ask today whether it is possible to collect at all and avoid controversy. Nearly every aspect of history, historical interpretation, and historical sources have been caught up in controversies, ranging from national history standards in education to exhibitions in major museums.^[161–163] The American archival profession seems timid in dealing with such issues, suggesting that acquiring records posing the slightest problems may be overlooked in favor of collecting less contested and often older materials. While there are continuing challenges to access to government records, it is difficult to find evidence of a dynamic archival profession arguing for a more liberal interpretation of classification regulations. The best recent volume on the importance of records and the challenges of access to government records is Theoharis^[164] and the best recent example is the work of the National Security Archive,^[165] showing a weakened archival profession not willing to try to enforce existing records legislation or to work for strengthened legislation.

The records of American businesses have presented a particularly difficult aspect of collecting, as archivists realized that the businesses themselves were rarely establishing institutional archives and that the records were voluminous in comparison to what other types of records represented.^[152] Archival programs with a national scope in documenting businesses often had to reevaluate just how they were conducting their mission. Harvard University's Baker Library shifted from a national scope to one focused on the New England region,

and even then it had to develop more aggressive criteria in reducing the size of its holdings—at a time long before the archival profession began to develop theoretical foundations for such work.^[166–168] In the mid-1990s, a national conference on the appraisal of American business records tried to deal with the myriad challenges posed by corporate records, but whether or not it really helped get any closer to developing workable solutions is unclear. The American archival profession still sees itself as collectors of such records, while the quantity and complexity (especially the uses of electronic information technology) of these records defy the possibility of acquisition.^[169] Calls for the profession to work on establishing institutional or corporate archives have gone largely unheeded. The specter of an archival fascination with acquisition seems to suggest the problems with archivists who view themselves as collectors.^[170,171]

Cooperation has also been recognized as a critical but elusive element for collecting and appraising. Government archivists pushed for cooperation, especially in sharing scheduling information, so as to bring control to the housing of voluminous qualities of records. In 1988, the Inter-governmental Records Project, uniting in 1990 with Research Libraries Group's Government Records Project to share descriptive information, started as a pioneering effort at some sort of joint appraisal effort.^[172] Cooperation has not been a general success, however, even though it is obviously needed in the archival community. When surveys accumulate data about collecting practice, interest in and activity supporting cooperative approaches generally come up as the weakest link.^[173] Some would contest this conclusion. In the early 1980s, Philip Mason had this description about labor archives: "The issue of competition between labor archives is no longer the problem that it was 20 or 30 years ago when the "scarcity" theory of collecting dominated the field. Archivists now recognize that not only are there enough important and valuable collections for all archives to share, but indeed, the existing programs cannot begin to collect and preserve the available union sources. Cooperation has replaced competition among labor archivists."^[50] If this is the case, such cooperation is a rarity.

There have been other documented instances in which two or more repositories have worked together to deal with voluminous or complex records.^[174] These have been either rare occurrences or rarely documented, however. The establishment of statewide regional networks in the late 1960s seems to be the apogee of such archival cooperation, but they have been well documented as being more effective in nurturing use than in coordinating collecting and acquisitions. See Cameron, Ericson, and Kenney^[175] for the most balanced assessment of these networks. Some have argued that the networks helped manuscript collecting, such as Fogerty.^[176] Forty years ago, archivists realized that they needed to be organized in some manner that would enable more focused

collecting and that would reduce competition. In the United States, a number of states set up regional systems, usually under the direction of the state archives.^[177] There is another tension here, however. For generations, archival repositories seemed to thrill in the competitive hunt for personal papers, family manuscripts, and similar materials. Increasingly there has been recognition that there must be strong and able cooperation.^[178]

There have been other persistent barriers to collecting. Prior to such ideas of systematic analysis and collecting, archivists tended to focus on approaches promising flexibility and experimentation from a conviction of the inability to assess the overall documentation universe.^[179] In the not-too-distant past, many archivists stressed more good public relations and cooperative efforts rather than a high degree of analysis that could be called appraisal.^[180] The amazing growth in thematically oriented collecting programs also created new programs for such institutions as colleges and universities. The fact that a single faculty member with a diverse career and research interests might be the target of two or more such programs generated the need for more cooperation between repositories.^[181] This is a different problem from trying to develop such criteria as tenure status, reputation, institutional service, and community role as the basis for collecting decisions.^[182]

Some aspects of appraisal and collecting require multi-institutional partnerships, such as moving image records, that somehow move the process far beyond just a collecting function, although thousands of repositories worldwide probably acquire motion pictures when they are offered.^[183] Still images—photographs—have been even more problematic. They are generated in the millions by government, corporations, artists and commercial photographers, and private citizens, yet they are eagerly collected, often violating provenance, without much regard to rigorous standards (although such standards have been around for quite a while).^[184] Some record materials, such as sound recordings, require so many accommodations for technical issues of maintenance and use that their collecting is dictated by many different factors than the normal or traditional paper-based records systems.^[185]

It has long been recognized that one of the greatest challenges is the lack of a national system in appraising and acquiring records, leading to some early calls for better communication about appraisal decisions.^[186] Many other countries have recognized problems with the lack of national policies that provide some guidance for coordinated work such as appraisal and collecting.^[187,188] There have been some considerations of the legal implications of such problems, with the usual laments about weak national, regional, and local legislation supporting the acquisition and maintenance of records.^[189]

As a result of such problems as these barriers, some archivists have called for sensitivity in appraising large accumulations of government records such as case files for underdocumented elements of society.^[190] This

concern brings up the question of what the collecting mission of any archives should be. Examining the collecting of Native American visual records, Canadian archivist Jim Burant laments that too many archivists are “driven” to meet researcher’s needs “rather than attempting to take a more all-embracing approach to documenting and reflecting society.” Burant continues that “as an archivist, as a native Algonquin, and as a human being, I feel that public institutional archives must reflect as broadly as possible the nature, fabric, and conflicts of the society from which they spring.”^[191] Others have made similar pleas for a social sensitivity in appraising and collecting,^[190,192] but the uninhibited human nature of collecting works against any kind of uniform approach for dealing with such matters.

COMPLICATED TIMES

There is little question that how archivists perceive their holdings, their collections, and, consequently, their mission has become more complicated. Archivists are now far more sensitive to issues like privacy, accountability, public memory, truth, politics, identity, and the ethical implications of their actions. Some of these matters affect deeply how archivists think of collecting, a function they once took for granted.^[193] The mission is changing. Especially important to the transformation of the archival mission has been the increased role of indigenous and community groups in taking responsibility for their own records. This works against established, traditional archives sweeping up records as they have for decades, while increasing the possibility of preserving and protecting a greater and more diverse portion of our documentary heritage.^[194,195] Along with this transformation has come some particularly difficult stress points, such as those witnessed with the debate about the proposed Native American Archival Materials and, more recently, the claims about social justice being a purpose for archives.^[196–198] The notion of collecting is being challenged, or, at least, the assumptions about collecting are being questioned.

CONCLUSION

Archival collecting is not just a mindless exercise in sweeping up old records or sitting back and waiting for the important records to appear for maintenance by an archives; rather, collecting is a process enmeshed with political, theoretical, psychological, and historical elements. More research is needed about the nature of archival collecting. More understanding by society about how archives and historical manuscripts repositories are formed is needed as well. The image of an archivist as an Indiana Jones-type character hunting out the treasures

of the past in exciting pursuits is romantic but inaccurate; rather, archivists are flawed humans trying to develop clear and reliable methods for identifying records that should be acquired by archives. Much of merit has been accomplished by archivists and manuscripts curators gathering records, but more reflection and experimentation needs to be done on this topic. It seems that the new archival hunters and gatherers will be using very different techniques to sleuth about in the sophisticated record-keeping technologies of the twenty-first century.

Area and Interdisciplinary Studies Literatures and Their Users

Lynn Westbrook

School of Information, University of Texas at Austin, Austin, Texas, U.S.A.

Abstract

Interdisciplinary scholars and their literature pervade modern academia, reaching into the humanities, social sciences, and natural sciences. Their publication formats include standard monographs and journals, as well as a rich array of gray literature. Online searching remains, however, problematic with library services and collections struggling to meet their information needs. Using both formal and informal information networks, interdisciplinary scholars construct and maintain their own knowledge domains. Variations in the information experiences and literatures of interdisciplinary work in the humanities, social sciences, and natural sciences continue to require focused support mechanisms.

INTRODUCTION

The stock phrase “increasingly interdisciplinary” describes so much of modern academia that many fields within the humanities, the natural sciences, and the social sciences now expect disciplinary boundary crossing as part of their intellectual landscape.^[1,2] Interdisciplinary studies are characterized by their deep integration of the theories, methods, perspectives, and basic concepts of two or more disciplines with a resultant body of scholarship that moves beyond the boundaries of any single discipline. Area studies, a subset of interdisciplinary studies, concentrate holistically on the culture, nature, concerns, and problems of a particular geopolitical or cultural region, thereby generating that essential integration of disciplines. The resultant information landscape of any interdisciplinary and area studies (IAS) field is inherently rugged and unstable. The goal of this entry is to synthesize current understanding regarding IAS information structures and the related experiences of scholars who use and contribute to those structures. Included in this synthesis are materials on IAS scholars’ experiences in using available publication formats, finding primary sources and gray literature, online searching, using library services and collections, using informal information systems, and building and maintaining their knowledge domain. A brief research agenda and bibliography provide support for additional study.

UNDERSTANDING IAS

Definitions

At its simplest, interdisciplinary work may be defined as the deep integration of the theories, methods, perspectives, and basic concepts of two or more disciplines with

a resultant body of scholarship that moves well beyond the boundaries of any single discipline.^[3,4] However, academic disciplines, like ecosystems, are in almost constant flux and the tidy categorization of a field as “interdisciplinary” may ignore roots which still impact the direction of its growth. (For an in-depth explication of these complex issues and forces, see Palmer).^[5] Therefore, understanding the context, measures, artifacts, and drivers of interdisciplinarity supports any effort to strengthen relevant information infrastructures.

Disciplinarity is not, of course, a binary proposition; single-discipline and IAS fields are not the sole forms. Other boundary crossing^[6–8] approaches include multidisciplinary, transdisciplinarity, and information probing. Multidisciplinary research entails the use of two or more disciplines in examination of a research question without any integration of approach, method, theory, or tools; parties bring their own expertise to the table, and the resulting research is quilted together by connecting disparate segments rather than integration. Disciplines are respected, boundaries maintained, and applications focus on the research problem. Transdisciplinary research transcends disciplinary boundaries entirely, building on an overarching perspective to synthesize research. While interdisciplinary fields are indeed academic disciplines with all the infrastructure and information ecologies appertaining thereto, transdisciplinary research consciously eschews academic disciplinary boundaries. It does not integrate or absorb them but, rather, utilizes whatever is needed at any given moment with no intent to form a new discipline.^[1,9] “Information probing”^[10] is an individual’s effort to test the waters of another field by examining information resources, data, theories, and/or principles in light of a particular information need. Such probing may lead to active participation in transdisciplinary/multidisciplinary/interdisciplinary work but it may also be a onetime experience.

Measures and Artifacts of Interdisciplinarity

Measures and artifacts of interdisciplinarity have been studied for almost 50 years in an effort to understand the boundaries of intellectual domains and the consequences of changes in those boundaries.^[11–14] The bibliometric concept of “scatter” underpins much of this work by measuring scholars’ output (for example, journals and monographs) as well as the meta-structures of the field (for example, periodical indexes and digital libraries). In “high scatter” fields, scholars publish in a wide range of journals and monographic series so that numerous periodical indexes and digital libraries are required in any comprehensive search of the literature. In “low scatter” fields, scholars publish primarily in a handful of forums which are readily indexed in a few key tools. IAS fields are, inherently, “high scatter” in that they publish in, are cited by, and choose to cite in a wide range of forums as they pull from various disciplines. The interdisciplinarity of particular journals can actually be measured through social network analysis using “betweenness centrality” as an indicator to denote where a journal lies in relationship to the disciplinary location of other journals.^[15,16]

Apart from bibliometric analyses, the academic infrastructure has a powerful influence on hiring faculty, providing the intellectual freedom of tenure, and building research support. In any field, including those of IAS, that infrastructure develops in relationship to life cycles in research specializations which develop and redefine their intellectual boundaries. The typical pattern is an initial period of slow growth which moves into an explosion of research that gradually tapers off to a steady state.^[17] In much of academia, that steady state has been reached when faculty work within a funded infrastructure that actively supports the tenure of effective scholars. Since IAS fields, however, are formed outside that academic norm, they must choose to either construct their own infrastructure or deliberately live outside of it. On any given campus, an IAS faculty may work to gain program, research center, or school status with line-item appointments for permanent faculty, an appropriate tenure system, and research support. Many will start with faculty who hold formal line appointments in multiple departments, run projects based in multi-jurisdictional research centers, hold appointments in departments other than those in which their doctoral work was completed, regularly teach and/or hold research concentrations in multiple departments, and build collaborative research connections across academic units.^[18]

Drivers of Interdisciplinarity

The drivers of IAS impact users’ experiences and the development of the literature. The histories of modern IAS fields are far too varied to permit a complete list of their origin patterns. For example, those of the natural

sciences alone include subsets of, variations on, and additions to the patterns explicated below.^[19] Nevertheless, these three broad patterns directly influence the information ecologies within which IAS scholars must function^[12] and, therefore, merit delineation.

In many IAS fields, isolates built and continue to develop their own academic infrastructure around their own discipline because their original “home-discipline” colleagues deemed their work too activist, unimportant, or offensive for support. Those who hold political and economic power could, and do, simply deny tenure, refuse research support, and reject curricular change. The growth of women’s studies exemplifies the isolates’ drive for disciplinary autonomy. The work of Florence Howe and Catharine Stimpson, among many others, eventually resulted in the development of women’s studies courses, degrees, and graduate programs as well as such infrastructure elements as the Feminist Press and journals such as *Signs*, *Feminist Studies*, and *Women’s Studies*.^[20] These scholars construct their own publications streams, academic organizations, and networks within, across, and beyond campuses.

Isolate driven fields often live with a certain degree of tension between scholarship and activism that adds a particular layer of complexity to their entire information stream. As new materials are created, published, and indexed both within and outside of academia on a wide range of issues, such fields must “rescue” works which have been ignored as unimportant, archive the nonacademic results of social change, and otherwise integrate social outcomes with scholarly endeavors. In Black Studies, for example, the intellectual output of both scholarship and activism is used by individual adherents of both approaches.^[21]

In contrast with the isolates approach, most area studies are built on a broad but robustly integrated, sociopolitical approach that is rooted in the nexus between culture and history. Although politically unpopular at times and/or driven by governmental needs relating to foreign policy (for example, Middle Eastern Studies), area studies focus on the cultural region as a whole. For example, American Studies grew from the pre-World War II development of a widely held conceptualization of U.S. values, traditions, and ideals. Nourished by such books as Ruth Benedict’s *Patterns of Culture* (1934) and championed by such intellectually pluralistic individuals as President Roosevelt’s vibrant Librarian of Congress, Archibald MacLeish, the American Studies movement, from its inception, genuinely involved art, history, literature, journalism, sociology, and political science.^[22] These scholars redeploy, reconfigure, and redevelop existing infrastructure to meet new demands; they work from an intellectual space which is more within than apart from the academic norm.

More recently, deliberately developed interdisciplinary research groups and institutes have formed around broad research areas (for example, biomedicine), social/physical problems (for example, global warming), or technology

(for example, the Internet or the Advanced Photon Source at the Argonne National Laboratory) with the intention of weaving together an effectively chosen array of disciplines. For example, the Rockefeller Institute/University, with its 23 Nobel laureates, 5 McArthur fellows, and 12 National Medal of Science winners, produces stellar biomedical research without utilizing a traditional academic disciplinary organizational structure.^[23] Scholars in this type of intentionally constructed, interdisciplinary organization utilize existing publication and indexing structures but augment them through the development of their own networks for both formal and informal information dissemination.

All of these approaches share a critical, common element, i.e., a focus on the research questions. As Karl Popper noted 45 years ago, “We are not students of some subject matter, but students of problems. And problems may cut right across the borders of any subject matter or discipline.”^[24] Scholars, with few exceptions, focus on their work rather than the information structures supporting that work. To a certain extent, IAS scholars have had to build their own information dissemination mechanisms (for example, new journals and monograph series in women’s studies), construct their own information networks (for example, conferences and associations in American Studies), and design their own information access systems (for example, data archives and clearing-houses in biomedicine). These actions provide a degree of self-definition and demarcate arenas of intellectual responsibility. Library and information studies (LIS) scholars and practitioners must take those factors into account when building support structures to help IAS scholars find the information they need.

ISSUES IN THE STRUCTURE AND FINDING OF INFORMATION

Six issues repeat in the numerous analyses of IAS information structures, activities, and concerns. They are publication formats, primary sources and gray literature, online searching, library services and collections, informal information systems, and knowledge-domain maintenance. Obviously they overlap and intersect to some extent but each issue provides a valuable perspective on IAS work.

Publication Formats

As IAS fields coalesce into established programs with all the support structures of academia,^[25] their professional associations and university presses begin to produce journals, monographs, conference proceedings, and book series in support of their scholarship. Journals may be focused on the field directly (for example, *Internet Mathematics* and *Neuropsychopharmacology*) while others will deliberately include connections to the latest IAS research

within the publications of sister disciplines (for example, *Cell*’s regular section highlighting materials recently published in interdisciplinary journals such as *Neuron* and *Immunity*).^[26]

Gray literature, discussed more fully below, is defined as research and professional materials published outside of mainstream formats and generally overlooked by indexing tools. It is often integral to the development of interdisciplinary fields, particularly in the early stages of their development. In some underfunded fields, gray literature remains crucial and actively calls on IAS scholars’ time. Archaeology, for example, produces reams of primary material that is intended to support additional studies as well as reports that are meant to, in part, inform the public. Much of it, however, is in the form of gray literature found through Web-accessed databases that are voluntarily populated by scholars.^[27]

All publication formats are embroiled in the broader concerns of information-technology development. For those nascent and less well funded IAS fields, the lure of information technology is complex. In archaeology, for example, moving decades of paper records to a digital format is alluring, but migration is extremely expensive for the original effort, much less any subsequently required migration.^[29] Digital libraries (for example, Archnet) and databases (for example, the National Archaeological Database) develop from professional organizations and subgroups taking on the responsibility of utilizing information technology, but the autonomy of scholars combines with their focus on producing, rather than disseminating, research to prevent comprehensive digitization programs. The Internet’s ability to permit scholarly communities to define their own boundaries has long been recognized as a significant support for IAS communities^[28] but significant work in building on that support still requires substantial organization, connectivity, and resources.

Primary Sources and Gray Literature

In addition to the general publication format issues already highlighted, IAS scholars face particularly complex problems in their access to primary sources and gray literature. The barriers to creation, publication, indexing, and collecting are profound. The solutions, often strengthened by user-controlled information technology, are neither comprehensive nor standardized.

Certain materials are simply not kept because they are not recognized as worth keeping by those with the power to do so.^[29] Original writing, art, music, archives, and instructional materials are, therefore, lost and not always susceptible to rescue. Again, women’s studies provide concrete examples of voices that are not privileged, such as Florence Howe’s 1971 effort to teach a course on “Women and Identity” at Goucher, which was rejected as “offensive.”^[30]

Many important collections have been developed locally, particularly in women's studies, but they often lack substantive off-site access.^[31] Creating digital libraries of these primary source materials is far too costly and labor-intensive for most IAS fields to support on the basis of internal infrastructure and funding. Even the simple effort to create online finding aids for primary source material and gray literature, including archives, is beyond the scope of possibility. Historians, as well as others, still want the type of item-level record that is not really feasible in most archives.^[32] In fields where much of the gray literature has moved to the Internet, such as social policy research, the access mechanisms have not kept pace, which has led to the paradoxical outcome that users have difficulty in culling out the unwanted material.^[33]

Nevertheless, strategies and techniques to maximize access continue to develop. Organizations, libraries, and even individuals have long been gathering oral histories, letters, and other unconventional documents as a way to provide voice to the unheard, dismissed, and marginalized of society and academia.^[32] Designing electronic portals to institutional, shared, and library-managed repositories of otherwise unpublished material on a global scale requires substantial will, cooperation, and effort but has been explored in various areas including the problem-based arena of geology's work on karst formations^[34] and the global environmental change community.^[35] Constructing the controlled vocabulary that best facilitates access to these collections adds a layer of complexity but can also involve scholars in reflective monitoring of their field's conceptual developments.^[36] Electronic finding aids available on the Web and constructed by librarians who know both their collections and their users are increasingly used by historians.^[35]

Online Searching

The three interconnected problems in online searching for IAS information are vocabulary failures, inadequate indexing, and multi-database use. Consistently applied and universally understood terminology tends to be more sought than available. Terms do not map across disciplines^[37] or even across the databases within a single discipline.^[38] For example, the "elusive" nature of terminology in anthropology combines with the wide range of its subject matter to make information seeking particularly difficult. Post-coordinate indexing, like keyword searching, gives the user control over conceptualizing connections among ideas and approaches in an IAS field^[39] but it also requires more thought, self-awareness, and skill than would an effectively pre-coordinated controlled vocabulary. Even apart from disciplinary jargon, words such as "culture" carry very different meanings in various disciplines so that a kind of intellectual "translation" is needed to actually mine the databases of disparate fields. IAS scholars often find the adaptation to multiple

intellectual vocabularies quite problematic.^[40] The advent of keyword searching on the natural language used by authors in the titles, abstracts, and even full text of their works opens the floodgates of information access but provides none of the mapping or translation required to hone a search. Reliance on keyword alone overlooks the difficulties inherent in navigating multiple perspectives using unstable language. IAS scholars must, therefore, develop deep online search skills that enable them to use both controlled vocabulary and natural language in databases and search engines.

Even well-developed skills are useless, however, if they cannot be applied. Search skills can only be applied when indexes are available and when those indexes cover the needed material. The cost of indexing journals, conference proceedings, collected works, and monographic series is substantive, and commercial companies follow the market, investing in that effort only after the market demand makes their effort financially viable. Particularly in the newer IAS fields, problems with indexing are common so that finding the best research in specific journals is not always easy. In women's studies, for example, the majority of the journals were inadequately indexed over a decade ago,^[41] a situation that is neither uncommon nor readily resolved although a great number of new resources are available including some which are free.^[42] In both economics and psychology coverage of the many subdisciplines within these interdisciplinary fields varies widely.^[43] Of 11 indexes covering quaternary studies, relevancy rankings on broad searches ranged from 49% to 99%.^[44]

Between language problems and indexing inadequacy, most IAS scholars need to search several databases efficiently.^[45] Using a single database is almost always insufficient for a comprehensive IAS search^[46] but using multiple databases requires mastering so many search skills and techniques that this, too, poses significant problems. In social work, for example, both *Social Work Abstracts* and *Social Service Abstracts* are required for a substantive search since these two indexes complement each other, rather than overlap.^[47] In later-life migration studies there is so little overlap among the 12 most relevant databases, both disciplinary and multidisciplinary, that scholars need to search all of them when recall is paramount.^[48]

Fortunately, both database availability and search options are improving for IAS scholars. New databases are developing to address specific fields and to deliberately include an array of fields,^[50] although their use is not uniformly productive for all users.^[49] Citation searching, a favorite information seeking technique for people in many social science and humanities-rooted IAS fields, is increasingly available via ISI Web of KnowledgeSM.^[32] Meta-database searching^[32,50] is available via vendors' standardized interfaces that allow end users to search several databases simultaneously. Although still developing,

Google Scholar already covers 27% more core articles in one IAS field than the next most nearly complete database, Social Sciences Citation Index.^[51]

More specialized refinements are still limited but their potential is encouraging. Visual search interfaces, although still rudimentary, show promise of particular interest to IAS scholars who must search multidisciplinary databases. The ability to both identify and refine subtopics may be enhanced by the visual search mode.^[52] An ontological approach to mapping knowledge domains can support scholars' exploration of concepts, theories, research questions, and relationships with, perhaps, greater effectiveness than a subject approach to controlled vocabulary.^[34] Similarly, the social network approach of tagging provides a user-driven avenue for identifying worthwhile information; such control might be particularly useful in developing and/or rapidly changing IAS fields.

Using Library Services and Collections

As a natural by-product of their effort to locate, integrate, and manage information from multiple disciplinary perspectives, IAS scholars have more reference questions than do single-discipline scholars, as has long been understood.^[13] In addition to more numerous questions, IAS scholars need holistic, continuous reference service that is integrated into their research streams. Librarians should actively partner with these researchers, helping them identify connections, language, viable resources, authoritative sources, and accessible experts with whom to network.^[53] Developing the detailed understanding of IAS scholars' work that makes such in-depth service effective can be developed by bibliometrically mapping the intellectual environment in which the scholars work.^[54]

In addition to vigorous reference services, libraries provide rich collections of valued information in multiple formats. Overly narrow libraries undercut IAS connections to sister disciplines^[55,56] but even the most open collection management policies are stymied by practicalities of the IAS information stream. Frequently monographic print-runs are small so that scholars, as well as librarians, note that materials are out of print quickly.^[57] Some IAS clusters are so small and informal that their needs can be unmet by efforts to meet the needs of the majority.^[58] Establishing purchasing structures which deliberately account for the needs of IAS research through development of funding lines and procedures is essential. For example, more than half of the monographs reviewed in major history journals are actually classed outside of "history" in the LC system.^[59]

The serials crisis has long made adding new titles, without cutting old ones, almost impossible, but IAS fields commonly generate and require new journals in which to publish the research that is not acknowledged or valued in scholars' "home" disciplines. Some libraries lack budget lines, procedures, approval plans, and staff who are

properly trained for building print and digital collections to support IAS fields^[60] although systems for properly identifying core IAS journals offer some support.^[61,62] In racial and ethnic studies libraries frequently lack the depth of journal collections that most fully support a developing program; for example, one study indicates that less than a third of Association of Research Libraries collections include half of the Latino research titles.^[63]

In addition to standard collection management and reference service concerns, the large number of IAS fields that use government documents requires government document librarians to review their priorities and patterns. Integrating government documents collections into the main collections exemplifies the extreme of collection management and service concerns. Librarians who merge collections, properly bolstered by reference and information literacy services, must balance the potential for greater access via browsing and searching^[64] with the potential loss of access due to variable formats and heavy reliance on the most complex of corporate author systems. As government publications continue to migrate to electronic format, accessibility may increase use in some IAS fields.^[65]

As already noted, classification and subject-heading choices privilege certain perspectives in library catalogs. Perhaps the most obvious connection between the librarian's codification and the discipline's self-definition lies in Melville Dewey's insistence that the nascent field of "Home Economics" be classed as a "Useful Art" (600s) rather than a form of Sociology (300s).^[66] Efforts to correct, update, expand, and refine Dewey, LC, and other organizational systems to enhance access across the range of IAS fields are long-standing. Examples of such efforts include the following: *A Women's Thesaurus*,^[67] *Women in LC's Terms*,^[68] an empirical analysis of subject headings on women's studies with amelioration recommendations,^[69] an entire IAS adaptation process for classifications,^[70] and NASA's Global Change Mastery Directory.^[71]

Informal Information Systems

In all of academia, the informal information systems embedded in social networks, conference structures, and collegial connections are often more a part of the scholar's daily information life than is the library. In IAS fields, however, the disciplinary influences on language mentioned earlier play a role in the development and efficacy of these informal information systems. Interpersonal communications, regardless of channel or context, require some means of reaching a shared understanding of terminology. "Fundamental terminology should be established early and reviewed regularly. This may mean that the minority chooses to speak the majority tongue."^[72] Time to learn how to communicate across disciplines, attitudes of willingness to engage in developing a shared

understanding, and the real and/or virtual proximity needed to make regular contact convenient are essential for deep collaborations of a genuinely interdisciplinary nature.^[73]

Evidence of these patterns is found in the norms of interdisciplinary research centers, which have been shown to foster interpersonal connections across disciplines more than within disciplines. Indeed, one study determined that an average of 84% of these connections develop after individuals join the center. Although center directors and select senior faculty act as nodes for cross-disciplinary communication, the greatest range of connections to different disciplines is found among graduate students and postdoctorates who actually build the links among faculty.^[74]

In both social science and natural science interdisciplinary, research collaboratories, the informal information networks among the scholars yield more than simple factual information. Exchanges are productive in terms of learning new processes, research methods, and technology skills, as well as in terms of generating new ideas.^[75,76]

The proliferation of discussion lists supports the informal seeking and exchange of information as well as the general discussion of ideas; small groups of people, however, tend to be most active in these endeavors.^[77] Some disciplines, for example, music, utilize unstructured, interpersonal connections but prefer in-person contact to electronic channels.^[78] The development of Web-based communities (WBCs) supports both IAS communication and development of customized resources. Although the lack of research on WBC generates more questions than answers, the potential for active, global information support of an informal nature is well worth further examination.^[79]

Knowledge Domain Maintenance

As might be expected within these parameters, many IAS scholars have long had to work extremely hard to both construct and maintain their domain knowledge. The difficulties of keeping up with the growth in their fields are part of their academic life.^[80] Engineers, for example report that the fragmentation of their literature and the sheer volume of publications combine to create a sense of information overload, generating the conviction that they are not finding all they need for their work.^[81] Obviously various current-awareness tools and alerting services, such as *Current Contents*, can be helpful; one study noted that about two-thirds of faculty in natural resources made use of them.^[82] In women's studies, one exemplary complaint of scholars is that keeping up "in the way that discipline-specific folks do is impossible" and those who do gather material effectively may well echo their colleague's statement that "I don't have a sense how to organize the materials. . . ."^[67]

One aspect of this continuous effort to gather useful information is the increasingly common problem of discerning quality. Surviving the academic promotion and tenure process is vital for most humanities and social science scholars who want to continue their work, as well as those natural science scholars who want to work within academic rather than governmental or corporate environments. As IAS fields mature, recognized and generally acknowledged standards of publication quality develop, which support consistent application of promotion and tenure requirements.^[83] In nascent or rapidly changing fields, however, those widely accepted benchmarks are lacking, and this adds another layer of uncertainty to the information seeking. The ability to rapidly recognize indicators of quality scholarship is a hallmark of the expert but even expertise in a new IAS field may be insufficient to support efficient analysis across the multiple channels and formats of information available.

DISCIPLINARY OVERVIEW

Within the context of all six of the information concerns delineated above, IAS scholars share, to some degree, a primary information-seeking trait, i.e., an open-minded approach to work in other disciplines. This willingness to consider other academic perspectives, theories, language, assumptions, research, and applications colors their information experiences. In the IAS fields of the humanities, social sciences, and natural sciences, that open-minded approach leads to serendipitous information encounters,^[84] the use of multiple disciplinary vocabularies, a drive to maintain currency in multiple areas, and a strong need for effective information management skills.^[85] Within that overarching context, an examination of information experiences more common to each broad arena is presented below.

Humanities

In the humanities, scholars still prefer "footnote chasing, colleague networks and their own files over online systems" with the lack of retrospective access still a significant problem. Working independently, these researchers build their own personal collections through browsing and expect to travel in order to access distant collections. Making use of personal bibliographic control software and image-capturing tools, some scholars build their own databases and collections which reflect their own analytic perspective, for example, chronological or thematic.^[86]

Analysis of several IAS fields within the humanities reveals more focused concerns. Medieval studies, for example, includes women's studies, art history, archaeology, and sociology, as well as a growing focus on history. Nevertheless, the International Medieval Congress papers remain conceptually housed in literature^[87] as do

monographic publications in cultural studies.^[88] Databases of visual collections remain clumsy and counter-intuitive for art historians so that the vast majority of their work is still done in print formats.^[89,90]

Unfortunately, scholars with roots in the humanities generally lag behind those of the physical and social sciences in development of Internet and database search skills. Those who most need effective databases are the ones least likely to have them. Almost 86% of music scholars make use of materials in “criticism, literature, art history, philosophy, anthropology, or psychology” with informal information seeking among colleagues a quite common part of the research process.^[91]

Social Sciences

A reliance on journals, informal networking with colleagues, and citation-tracing is still the hallmark of the social sciences^[92] although an increasing number of substantive databases support keyword searching across disciplines. The widely accepted information-seeking model of social scientists applies to many of the IAS scholars with its emphasis on six basic patterns (starting, chaining, browsing, differentiating, monitoring, and extracting)^[93] but the four additional patterns employed by scholars studying stateless nations (accessing, networking, verifying, and information managing)^[94] are of particular interest.

In the social sciences, foci often integrate in clusters of sister disciplines. Demography, for example, clusters more closely around the triad of sociology, family studies, and economics than it does around its next most common cluster of public health and medicine.^[95] Interdisciplinarity is more of a continuum than a pervasive characteristic in some social science arenas; for example, those historians who take a problem-centered approach utilize works from sister disciplines far more frequently than do more traditional historians.^[96]

Access to these clusters of information is found in various journals covered by both discipline-specific indexes (for example, for history, *America*, *History*, and *Life*) and discipline-spanning indexes (for example, for public administration, *Expanded Academic Index*).^[97] Full-text journals are in demand but not always readily available (for example, European archaeologists have a few online publications but none provide substantial coverage of work on American sites).^[98] Personal libraries remain the primary information source for faculty in social work/family studies, who read their few online publications on more of a monthly basis. Younger faculty, who are, presumably, still building their personal libraries, make more extensive use of interlibrary loan than do senior faculty.^[99]

A few areas have been studied in sufficient depth to permit more focused patterns to emerge. The advent and development of electronic resources have moved scholars

in history to a heavier use of indexes but have not fundamentally altered their basic practices of using print materials, following citations closely, browsing, and using book reviews.^[100] Their reliance on archival material requires them to orient their information-seeking to the structure of each separate archive, including the appropriate finding aids and collections, before building the contextual knowledge that allows them to identify relevant material.^[101] Anthropologists rely on journals, visual materials (for example, maps), their own personal data and libraries, and interlibrary loan.^[102] In women's studies, faculty value librarian support in the early stages of their literature review process, need detailed access to primary sources, find indexes and monograph collections inadequate, struggle to keep current on their research issues from multiple fields, and want to work with well-educated, enthusiastic librarians who evaluate Internet resources rigorously.^[63,103]

In its relationship to other social science IAS fields, LIS is uniquely situated in that it is itself both interdisciplinary and information-seeking. LIS produces resources that are used by other fields seeking information, and it actively connects to other interdisciplinary, information-seeking fields.^[104] LIS both studies and exists within an environment of interdisciplinarity. Widely integrated, LIS has been established as an interdisciplinary field for the past 40 years with its boundaries continuing to broaden.^[105] One study found that almost half of its cites came from outside LIS while only 18% of computer science cites did so.^[106]

Natural Sciences

In the natural sciences, interdisciplinarity is more embedded and extensive than might, at first, appear. Although cross-disciplinary citations are decreasing in the last 20 years for the biological sciences, they do continue there and are actively increasing in the areas of agriculture^[107] and chemistry.^[108] Chemistry cites non-chemistry journals almost half the time.^[109] Bradford's law of scatter describes the dispersion of forestry journal citations in which 50% of the citations come from 35 journals and the other 50% from 1234 journals.^[110]

In one sense, IAS scholars working in the natural sciences are prone to even greater vocabulary problems than their counterparts in the humanities and social sciences. Terminology, while often precisely defined, still varies substantially in disciplinary contexts; for example, “gene” had five different meanings in one conversation.^[111] While most researchers expect to come to a shared understanding of broad terms such as “culture,” fewer would expect that “gene” requires similar attention.

Journal literature is far more commonly used than any other format but not simply because it contains more recent materials than do monographs. In neuroscience, for example, over 80% of citations are to journals but 30% of

those journals are 15 years old or older.^[112] The fundamentals of the field are established enough to make older material of use. Multidisciplinary science journals are heavily cited in support of new work.^[113]

In geography, the focus on more scientific aspects of the field involves a greater use of journals while books are used in those areas of geography that focus more on the social aspects of the field.^[114] Initial research indicates that almost half of geography publications entail at least two different disciplines.^[115] Using approval plans to effectively collect appropriate works in geography requires substantial analysis but can be worthwhile.^[116]

In the less generously funded fields, such as archaeology, comprehensive databases remain elusive^[117] although efforts to consolidate local systems continue. For example, the ARGOS multiunion catalog of 14 libraries in 10 languages^[117] was not fully successful but later developed into Ambrosia, a more functional catalog of two libraries in two languages.^[118]

The inherent tension between problem-centered researchers and structure-centered administrators poses information access problems for scientists who construct, or try to construct, their working environments on the basis of integration rather than administration. Many must work in teams, making their reliance on these administrative structures more critical than that of the more independent scholars in the social sciences and humanities. Administrative support for interdisciplinary research involves administrators in data archiving, organization, mining, and maintenance.

Although long-recognized as early adapters to electronic information resources, scientists in interdisciplinary fields can be somewhat unskilled and even naïve in using Google, databases, and the Internet in general. Not only do they have little sense of the differences (for example, comprehensiveness and search options) between Google and databases, but they are not always well informed about the authority of the resulting documents.^[119]

CONCLUSION

Research on interdisciplinary studies integrates the theories, methods, perspectives, and basic concepts of two or more disciplines to create a body of scholarship that moves beyond the boundaries of any single discipline. The resultant information ecology requires scholars and librarians to maximize access to journals, gray literature, and primary sources. Problems with variable terminology, inadequate indexing, online searching, thin research collections, and subject access support structures are part of the landscape. Information technology provides both the risk of costly retrospective conversions and the promise of enhancing informal information networks. Digital libraries, Google scholar, multidisciplinary databases, and digital archives are developing throughout IAS fields although

the pace of the growth is directly connected to the funding available in various fields or to the possibility of fiscal feasibility.

In the coming generation of IAS scholarship it should be possible to address several research questions in some depth. The varying nature of information support structures in IAS fields involves inherent tensions in the more common adaptations to information technology. Fields in which individuals produce heavy loads of original data (for example, archaeology) and fields which are still struggling to find baseline funding in academia (for example, women's studies) benefit from the grassroots autonomy provided by the Internet, but they have little experience in the information architecture and usability work needed to maximize that freedom. Research is still needed on the best practices, adaptation techniques, informatics, and usability criteria of IAS fields.^[120] Digital library and archive development, as well as nurtured growth of WBC, requires carefully planned design^[120] to be followed by evaluation.

From the perspective of information retrieval, an LIS-centric analysis of IAS fields provides raw data that can be used to better construct databases, communication infrastructure, gray literature repositories, and focused digital libraries. The evolving nature of IAS, influenced by academic power structures and external funding source priorities,^[121] provides a moving target for such analysis at the microlevel. The analytic lens might be directed toward homogeneities of approach to knowledge generation.^[121] For example, while characterizing the information experiences and preferences of Hispanic Studies scholars provides certain insights, a more productive path might be derived from analysis of ethnic/racial studies communities and biomedical studies communities. What do those research approaches and environments have in common and what information architecture designs best meet their needs?

Concurrently, however, additional research is needed on the most effective means of supporting IAS scholarship in terms of directly addressing the disciplinary issues and opportunities available to these scholars who deliberately embrace research in multiple fields. The IAS scholars' mental models of academic information-seeking certainly differ from those scholars whose work carefully stays within limited disciplinary boundaries. How do controlled vocabularies and indexing systems best support the intellectual exploration of multiple perspectives? Parsing large concepts more finely, for example, may lead to more effective searching in gender studies.^[122] Using Bradford's work on scatter, libraries might maximize serials access to support needs across disciplines by identifying indexes which serve as nexus points among disciplinary views.^[123] Digital libraries have the potential to serve as creative, information-rich, highly connective, and dynamic, scholarly spaces in which the complex needs of IAS scholars can be actively anticipated.^[124]

The growing meta-awareness of IAS approaches continues to generate deliberate efforts to integrate widely different disciplinary methods, theories, and principles. The relationship, for example, between art and nanotechnology has been proposed as a new approach to consciousness.^[125] In terms of knowledge discovery and theory generation, what information infrastructures are most supportive? As new IAS fields are created, how can LIS best anticipate information needs and become integrated into the information resource development processes?

IAS scholarship addresses the living framework of intellectual life in a global, complex, and problematic world. Bringing to bear the most appropriate tools, these fields address social, technological, scientific, and human concerns at the point of need. LIS is uniquely positioned both within and in support of IAS. The opportunity is also a responsibility.

ARMA International, Inc.

Carol E. B. Choksy

School of Library and Information Science, Indiana University, Bloomington, Indiana, U.S.A.

Abstract

ARMA International is a not-for-profit professional association dedicated to the management of records and information. Its primary focus is education and advocacy for its membership. As a professional association, it is the primary resource for persons needing education or networking in records management.

BACKGROUND

ARMA International (<http://www.arma.org>) is a not-for-profit professional association dedicated to the management of records and information. It provides educational resources such as seminars, conferences, and publications to records and information management (RIM) professionals and others responsible for managing organizations' information assets, creates standards and guidelines related to records management, and advocates for records management with the governments of the United States, Canada, and the European Union. The mission of the association

is to provide education, research, and networking opportunities to information professionals to enable them to use their skills and experience to leverage the value of records, information, and knowledge as corporate assets and as contributors to organizational success.

Headquartered in the Kansas City metro area, ARMA International's 11,000-plus members include records managers, attorneys, information technology managers, archivists, consultants, and others involved in various aspects of managing records and information. The association also supports approximately 125 chapters, which provide additional programs at the local and regional levels. Most of the chapters are in the United States and Canada with chapters in the Caribbean, Europe, and Japan and a growing membership outside of North America.

For many years, ARMA International has been known worldwide for its active participation in setting standards and best-practice guidelines in the field. It is the only association in the United States that develops RIM-specific standards approved by The American National Standards Institute (ANSI), which coordinates the U.S. voluntary standardization system. ARMA International is also actively involved in the International Organization of Standards (ISO), the world's largest developer and publisher of international standards. ARMA played a key role

in developing and launching the only international records management standard, ISO 15489. The association also works closely with other organizations, including The Sedona Conference, on groundbreaking guidelines.

ARMA is also well-known for advocacy in the United States, Canada, and more recently, the EU. ARMA testified in the U.S. Congress and organized a letter-writing campaign to ensure the Paperwork Reduction Act of 1980 was passed. In 2004, ARMA's association president testified in Washington, DC before a federal panel of judges on recommended changes to the Federal Rules of Civil Procedure that went into effect in 2006.

HISTORY

Business Records Management

Although the practice of records management has been traced back to the Sumerian civilization in 5000 B.C.,^[1] the profession is comparatively a much newer concept. In the late nineteenth century, many companies in the United States discovered the burgeoning number of typed and gel-pressed documents and records was making effective and efficient work nearly impossible. Several different social, political, and technological trends in the nineteenth century brought about the rise in records management independent of archives. The rise of the notion that society could be engineered and that government should intervene on behalf of citizens led to a greater need to document activities.

The narrow scholarly aspect of many of these traditional archives was to make it difficult for them to adjust to the information revolution unleashed by modern administrative and managerial practices. Across Europe and North America in the late nineteenth century, spurred by increasing state intervention in society, central administrations were growing in relative terms, and creating increasing masses of paper. In the private sector similar developments were under way which led, especially in the United States, to the emergence of new forms of records management.^[2]

Experts in Scientific Management applied their techniques to the office environment improving what we now call the “active phase” of the life cycle. Referred to as “Filing and Transferring” nearly everything we understand in the practice of records management was present by 1920.

In the United States, by World War I, the Warren Filing Association was founded in Chicago.

In 1914 Irene Warren, librarian at the University of Chicago, brought together a group of people interested in records-handling and began the Warren Filing Association. This was associated with the Warren School of Filing, which she had also founded for the training of filing clerks and supervisors.^[2]

In 1920, the Filing Association of New York was founded in New York City. The Chicago Filing Association was established in 1932 primarily for file personnel.

Government Records Management

After the Civil War, the U.S. federal government recognized that agencies exercised little, or no management of records through several congressional studies like the Hays Commission study of 1877 recommending fireproof buildings for storage of veteran’s records. An 1888, Senate study of recordkeeping processes produced many descriptions of problems of records having been kept long past any useful life and recommended the destruction of such records. In 1889, the General Records Disposal Act was passed but made very little difference to the burgeoning number of documents. In 1913, the Taft Report recommended using some of the methods adopted by business for handling, managing, and destroying information. By World War II, the number of U.S. federal records had grown past a size such that the National Archives, established in 1934, could possibly manage. A number of archivists and records officers within the federal government established several concepts such as the life cycle and retention schedules that became the foundations of modern U.S. records management.^[3]

CREATION OF ARMA

The Chicago Filing Association changed its name to the Records Management Association of Chicago and was incorporated in 1952, reflecting the contribution made by the U.S. federal government to the field. In the early 1950s, the New York association was renamed the Records Management Association of New York and was incorporated in 1955. In that same year, 12 records managers in New York formed the Association of Records Executives and Administrators (AREA).

At that time, some believed that the other records-related organizations were centered too much on filing and

retrievals and not enough on the management aspects of records. The Association of Records Executives and Administrators membership increased steadily, and other chapters were chartered in the mid-1960s.

ARMA became international in the 1960s when Canadian chapters joined including Montreal in 1968, Toronto in 1969, Vancouver in 1970, Ottawa in 1971, and Edmonton in 1975.^[2]

Shortly after its inception, ARMA began developing resources for records management professionals. In 1956, it launched a member newsletter and held its first annual conference. Four years later, the association debuted its first “official” publication, *Records Review*, and published the technical resource *Rules for Alphabetical Filing*, which eventually became an ANSI standard. In 1958, ARMA became part of the International Records Management Federation, a “steering committee” between ARMA, the Records Management Association of Australia, and the Records Management Association of South Africa. The International Records Management Federation’s goal was to help develop records associations in countries in need of such organizations.

ARMA continued to extend its reach and its activities in the 1970s. Then in 1975, it merged with AREA and became ARMA, the Association of Records Managers and Administrators. As the association’s influence both in North America and internationally grew, the association added “International” to its logo and became known as ARMA International in 1987. The board of directors decided in 1995 to officially do business as ARMA International, dropping the “Association of Records Managers and Administrators” in general use; this remains the official business name of the association today.

In 1997, ARMA signed an agreement with the International Records Management Trust and the International Council on Archives (ICA) to foster the development of records management standards and education globally. The agreement ended in 1999, but the relationship between ARMA and the ICA has continued, particularly in the area of standards development, such as competencies.

In 2005, ARMA extended its administrative reach to include Europe and European issues such as Data Security. This initiative was so popular among European members that they requested, and the Board of Directors granted, the creation of a member unit in Europe where cross-jurisdictional issues could be discussed.

DEFINING MOMENTS FOR THE ASSOCIATION AND THE PROFESSION

During the last 50-plus years, there have been a variety of noteworthy occurrences helping to fuel the growth and recognition of RIM in the business community. A major

boost came from passage of the Paperwork Reduction Act in 1980. This legislation addressed the need to manage information as a resource that is planned, managed, and included in the budget.

When several high-level e-mails became public in the Microsoft antitrust case (*United States v. Microsoft*) in the late 1990s, many executives expressed surprise that their e-mails could become part of litigation and be made public.

The effects of ISO 15489, the standard on records management unveiled at the 2001 ARMA conference in Montreal, Canada, made records management a global practice. Until the release of the standard, records management was primarily an Anglophone activity, the concept of “records” being an English-only word.^[4] Non-U.K. European companies struggled to conform to this new standard.

Nothing could equal the effect of the infamous Enron Corporation scandal. The handling of information played a critical supporting role in the drama that unfolded in 2001. It was played out in *U.S. v. Arthur Andersen, LLP*, which is generally regarded as the most widely publicized criminal case involving the destruction of business records. Andersen, one of the nation’s largest public accounting firms, was accused of destroying accounting records for audits it had performed for Enron after the U.S. Securities and Exchange Commission had begun its investigation into Enron. Andersen was eventually convicted of obstruction of justice, but the damage was done before the verdict was even announced. Customers fled. The Enron case and Andersen’s alleged role in it ultimately led to the rapid and bloody demise of the powerhouse accounting firm. Andersen was later acquitted, but too late for the thousands of employees and partners who had worked so hard and had lost, in some cases, a lifetime of work.

Later that year, Congress reacted to the Enron scandal and other widely publicized reports of corporate accounting irregularities by passing the far-reaching Sarbanes-Oxley Act of 2002. The act made regulatory compliance a higher priority than ever before for publicly traded companies, regardless of whether they were U.S.-based or simply traded on the U.S. stock exchange. For the first time, chief executive officers began to feel the very real threat—including a jail sentence and hefty financial penalties—that could result from mismanaging their corporate information assets. More and more, executives began turning to their legal, information technology, and RIM professionals to ensure their companies did not go the way of Andersen and others in the headlines. An important part of Arthur Andersen’s sudden decline occurred because employees had been told to, and did, destroy e-mails relating to their engagement with Enron. The employees as well as the persons instructing them did not know that the e-mails could easily be restored from back-up tapes. Many in information technology were surprised

to discover that e-mails could be relevant to a case of regulatory compliance and that back-ups could be viewed as business records and be subpoenaed for litigation.

That same surprise was compounded when a judgment against Morgan Stanley (*Coleman v. Morgan Stanley*) was issued for \$1.4 billion in part because the brokerage firm had not been able to deliver all the appropriate e-mails in the discovery phase of the trial. The judgment was reversed on appeal, but it sent shockwaves through the information technology community as well as the legal community. Another high-profile case that was not reversed, *UBS Warburg v. Zubulake*, cost the global banking giant, UBS Warburg \$38 million. Producing a few relevant e-mails each of the seven times the judge in the case ordered the company to produce what Ms. Zubulake knew and could prove they had, UBS Warburg became a victim of its own poor record-keeping. The e-mails involved in this case, however, were not “records” in the sense that governments define them, as having to do with the business of the organization. The e-mails the judge was compelling UBS Warburg to produce involved the authors’ beliefs in Ms. Zubulake’s “fitness” to be a broker.

While the judgment of \$38 million was far smaller than in *Coleman v. Morgan Stanley*, the *UBS Warburg v. Zubulake* case came only a few months before the 2006 revisions to the Federal Rules of Civil Procedure. One of the effects of those revisions was to clarify what could be produced for litigation from specific format references like, “documents” and “databases,” to all “electronically stored information.” Many companies as well as government entities struggled, and are still struggling, to ensure the organization can produce all information, whether electronically stored or not, relevant to a discovery subpoena. As case after case of lost or destroyed electronically stored information comes to light, all organizations continue to struggle to implement life-cycle management from creation to final disposition.

ASSOCIATION STRUCTURE

ARMA’s decision-making body is the Board of Directors. Lead by the President, the Board makes strategic and governance decisions. Membership is primarily geographical, with most members living near a Chapter belonging to that Chapter. Each Chapter is incorporated and has a board of directors as well as bylaws. The role of Chapters is primarily to provide education, and leadership and networking opportunities. Chapters are geographically organized into Regions. Regions are lead by a Region Manager, and several Coordinators whose job it is to advise the Chapters and give help where necessary. ARMA also has Committees that perform various duties including reaching out to membership, education, awards, public policy advice, and governance. ARMA creates task forces when a specific, limited action is required. The

Board makes decisions by first gathering information from its members' wants, needs, and preferences. The association also has an annual strategic planning meeting in which information gathered from members as well as reports from analysts and ideas from attendees are sorted through to determine what ARMA should be doing over the next few years. ARMA's records management competencies, published in October 2007, were the result of the first strategic planning meeting and are now the basis for all education in ARMA. Attendees to strategic planning includes all members of the Board, a member of ARMA's Company of Fellows, a member of the ARMA International Education Foundation, a regent from the Institute of Certified Records Managers (ICRM), and a Region Manager.

The Company of Fellows is made up of individuals selected by the Awards Committee. On an annual basis, the Awards Committee reviews nominations for Fellow of ARMA International (FAI), scores the nominations and determines whether any rise to the high standard set for this recognition to the furtherance of the profession. Individuals selected for this honor are permitted have the designation FAI after their name.

The ARMA International Educational Foundation was created as an independent foundation with its own Board of Trustees in 1996 for the purposes of funding research and education in the area of records management.

MEMBERSHIP

ARMA has more than 11,000 members globally. The backgrounds of members is extremely diverse as most people who become records managers are simply handed the job. At the last survey, more than two-thirds of members had some college or a college degree. A decade before, only half had some college. The reason for the change is the aging and retirement of a demographic group that could obtain gainful employment in business administration with only a high school degree. As this population has aged and retired, job descriptions for records managers have changed and now require a college degree. Most members do not have the title "records manager" as titles vary from level to level, organization to organization, and industry to industry. In addition, records managers have never reported to a single area or level of responsibility. There is some evidence that records managers are reporting to an executive instead of a manager and are reporting to an enterprise-wide function like compliance or legal rather than to an administrative function like facilities over the past decade. This lack of consistency makes identifying the person in charge of an organization's records very difficult and makes recruiting new members very difficult. Before the profile of records management and ARMA rose in the late 1990s, the only way to recruit new members was by word of mouth.

Anyone may join ARMA, including members and employees of associations considered competitors. Many members of ARMA joke that there are actually two qualifications for joining ARMA, one is a love of jigsaw puzzles, crossword puzzles, or Sudoku, and the other is to have a controlling, bordering on obsessive-compulsive, personality. Those two characteristics: a predilection for pattern recognition over logical thought, and a desire to put the pattern in order are very common personality characteristics for records managers. This does not mean that straight-line logical thinking is uncommon among ARMA members, but pattern-recognition is a commonly preferred mode of thought.

PUBLICATIONS

ARMA publishes the *Information Management Journal*, the world's only publication devoted solely to records management and the issues that impact records management professionals, quarterly and *InfoPro Online*, focused on association news, monthly. ARMA publishes three monthly newsletters that impact the practice and profession, the *Washington Policy Brief*, devoted to news from the U.S. federal government, the *European Policy Brief*, devoted to news from the European Union government, the *Canadian Policy Brief*, devoted to news from the Canadian federal government, and the *Information Management NewsWire*, devoted to issues outside the government. ARMA also publishes standards, textbooks, and practitioners monographs on issues including, technology, risk management, compliance, and industry issues.

Most Chapters have a newsletter or a Web site where articles and news of local interest is also published.

STANDARDS

Most notable of ARMA's standards is the Alphabetic standard mentioned above, which is a guide to creating file systems for active records. Other ARMA International Standards and Guidelines include, Glossary of RIM Terms, Guideline for Evaluating Offsite Records Storage Facilities, ISO 15489 Information Documentation—Records Management—Part 1: General, ISO 15489 Information Documentation—Records Management—Part 2, ISO/S 23081-1—Information and Documentation—Records Management Processes, Procedures, and Issues for Managing Electronic Messages as Records, Records Center Operations, Records Management Responsibility in Litigation Support, Retention Management for Records and Information, Revised Framework for Integration of electronic document management (EDMS) & electronic records management (ERMS), Requirements for Managing Electronic Messages as Records, The Digital Records Conversion Process: Program Planning, Requirements,

Procedures, Vital Records Programs: Identifying, Managing, and Recovering Business Critical Records, Working Collaboratively in an Electronic World.

ARMA creates and partners with other organizations and associations to create standards that impact records management professionals. Frequent partners include the Association for Imaging and Information Management (AIIM) and Society of American Archivists (SAA). ARMA is now partnering with the Object Management Group to create a technology framework for government records management that will retire DOD 5015.2.

COMPETENCIES AND CERTIFICATION

ARMA's independent certifying body is the ICRM. The ICRM creates, revises, and administers a six-part test leading to the designation of CRM, Certified Records Manager. Recognized globally, the CRM is currently held by more than 800 records managers. To deal with the ever-burgeoning duties and importance of records managers, ARMA created a set of competencies for the records management profession. Validated in the United States and Canada, the competencies, created by ARMA were created independently of the CRM. A recent joint task force mapped the CRM body of knowledge to the ARMA competencies and found nearly 100% agreement between the competencies and the ICRM test outline, further validation of both. Both the ICRM test outline and the ARMA competencies also reflect the broadly-based need to work with electronic records and all other forms of electronically stored information including e-mail and instant messaging.

EDUCATION

Nearly all of ARMA's educational offerings are now mapped to the competencies. Education is delivered to ARMA's members primarily through Chapter meetings. Approximately one-sixth of the membership attends the annual conference, the purpose of which is primarily education, but also networking. Conference attendees can choose from nearly a hundred sessions offered by practitioners and consultants in the meeting rooms and from nearly the same number of technology advisory sessions provided by vendors on the exposition floor. The accompanying exposition has technology vendors, shelving and archiving vendors, storage vendors, as well as consultants. Monthly webinars permit the reach of education to extend to anyone with an Internet connections. Additional conferences, such as the "E-Discovery and Beyond" conference have arisen as the need for more specialized education arises.

ARMA'S ROLE IN INFORMATION AND RECORDS MANAGEMENT

ARMA is a major hub in a network of networks. It functions as a professional network, an educational network, a sales network, and a social network. Its most important role is as a professional network. At various types of meetings: geographically or regionally focused, industry focused, nationally and internationally focused, members meet to listen to presentations by practitioners, consultants, educators, and vendors on issues relevant to their work lives. Because the speakers are vetted by records management professionals, or by staff well-educated in records management issues, ARMA meetings of all types are the only place where one can go and be assured of hearing a relevant, high-quality presentation. Conversations break out among participants with similar problems as a result of the presentations. Problems may be industry-related, geographical, life cycle, media, migration or conversion, vendor, business, resource, political, etc. Members share their experiences, both good and bad, making ARMA meetings the best place to learn the ins and outs of being a records manager. In this way, ARMA is truly a Community of Practice in Wenger's sense of the term.

ARMA is a vendor network. Vendors can become members of ARMA as membership is not limited to practitioners. However, only individuals can become members. Companies can join ARMA by paying for membership for its employees. Vendors have all the same privileges as members, but are asked not to use ARMA meetings to make sales pitches. ARMA chapters often request a vendor to speak at a meeting about their product or subject. For example, shredding companies are asked to speak about data security and privacy. ARMA meetings and vendor expositions at ARMA conferences, seminars, and chapter meetings are good venues for vendors to get their messages across to members in a low-key environment. ARMA practitioners and consultants are usually not decision-makers for vendor products, but they are recommenders. For all types of soft and hard products, ARMA members are key links in the sales of records management products and services. Because ARMA addresses the risk side of document life-cycle management, the rising profile of records management in litigation made ARMA a natural place for attorneys interested in electronic discovery to receive and provide education.

As the profile of records management has risen, more organizations ask information management vendors to address the risk side of information. Vendors of electronic content management (ECM), EDM, and imaging were targets of this request. To remain relevant these vendors, including IBM, FileNet, OpenText, Interwoven, and Stellent purchased or developed ERM modules. The trend in all industries toward consolidation of companies also lead these companies to buy each other: IBM bought FileNet, Oracle bought Stellent, OpenText bought Hummingbird, etc.

Consolidation within this multibillion dollar a year industry created reduced income for the trade association that represents most of those companies, AIIM, by reducing the number of large company members that pay much more than other members. Before these vendors realized their products were deficient in life-cycle management and were actually creating more expensive problems for organizations than they were solving (discovery being a seven-figure problem where productivity increases were only six-figure problems), they all showed at the AIIM show, which was attended primarily by information technology professionals responsible for managing documents rather than data. At about the same time, consolidation was rapidly increasing and records management was becoming a higher profile problem. AIIM sold its trade show to Questex (an organization that services associations primarily with publications and conferences), which combined the AIIM show with the On Demand show (output management), creating an annual shopping mall for information technology vendors managing documents. The Association for Imaging and Information Management has also ventured into records management education, but geared primarily toward the information technology professionals who were previously the primary decision-makers for ECM, EDM, and imaging technology. The education provided is at a very elementary level and is primarily focused on what a consumer would need to know in order to purchase ECM, EDM, and ERM applications.

The change in focus of purchasers from creation and distribution of information to full life-cycle management of information meant that vendor members showing at both the AIIM and the ARMA shows were spending twice as much money as they would if all potential purchasers were at one show. Another trend is the shift in decision-making regarding information management technology from the information technology department to the legal department. Because attorneys were more inclined to attend the ARMA show than the AIIM show, vendors found themselves forced to purchase space at both vendor shows in order to reach the information technology professionals, records management professionals, and legal professionals who would together make the decision to purchase document-related information technology. The expense and employee time required to have a booth at both shows, has lead vendors to request AIIM and ARMA to merge. While this suggestion has been made twice by AIIM and once by vendors to ARMA, there has been no movement as no model for merging a trade association where dollars are votes with a professional associations where individual members are votes has been suggested. The Association for Imaging and Information Management continues to be a valued partner of ARMA, providing education about document-related information technology products, and working with ARMA on document-related information technology standards.

For the same reasons and causes, ARMA is an education network. Until the past decade, ARMA was one of the few places one could go to get education in records management. Only recently have institutions of higher education offered courses in records management. Until that time records management was taught primarily at the community college level by practitioners and consultants. Two universities had faculty who taught records management, one in a department of business and one in library science, but only one of those had a program in records management. Neither program had a degree in records management. Most of these programs, both at the community college and university level ended when the faculty member or practitioner moved on or retired. Consequently, the only place a student of records management could be assured of a steady supply of education was through ARMA meetings, seminars, and conferences. Practitioners and consultants have been and still are the main source of education in records management. Product vendors also provide education through ARMA either in a regular program meeting or seminars advertised through ARMA publications and newsletters. Such sessions are focused primarily on content their products address, though some address broader industry issues.

Another problem with education in records management, as noted above, is that records management could as easily be associated with business and with library and information science programs. There is also a very strong legal component. This lack of fit into a normal university curriculum makes records management a very poor fit in any particular school, much less a single department. With the widespread use of computers another component has arisen that is normally associated only with Ph.D. studies in information technology, enterprise information architecture (EIA). EIA has three components: technology, information, and people, but departments of information technology usually only deal with one and one-half of those: technology and databases—documents are not addressed in the standard IT curriculum. Records management deals with how people use information, regardless of whether it is hard copy or electronic, i.e., regardless of whether humans are interacting with computers or paper; how people use documents—the best-known form of records; and with how governance impacts how people use and abuse information. The lack of understanding within most of the information technology community about EIA means that most software applications that handle information are created to function within a small department and to assist in the creation and distribution of information, not in the actually life-cycle management of information. Microsoft products are an excellent example of this, as are all ECM, EDM, ERM, and imaging applications. Schools of library and information science have begun to address these issues over the past decade, but still wrestle with the problem that records management addresses business objects whereas library science,

archival science, and information science address cultural objects. Despite all the changes in records management education over the past decade, perhaps the strongest network for getting education in records management is still ARMA meetings and seminars, as well as seminars advertised by education providers and vendors through ARMA publications.

As noted above in the publications section, ARMA International is the only place where one can find education in and discussions of cross-jurisdictional issues. Canadians and U.S. residents take this for granted and both share information and knowledge about political, economic, social, and technology issues without thinking. Other Anglophone countries have records management societies, but those associations are focused on a single country. With 50 states and as many different laws and regulations, it is the norm for U.S. members and Canadian members working for companies doing business in the U.S. to need cross-jurisdictional discussions. Canadian ARMA members have worked for many years to try to educate U.S. members on the need to pay attention to European Union issues. This finally sunk in over the past 5 years when European members told ARMA representatives that ARMA meetings were the only place where they could discuss cross-jurisdictional issues. Happy with their countries' records management associations, they needed a place to discuss EU and pan-European issues such as data security.

Conversations that begin at ARMA meetings continue off-line often to become warm friendships. A friend who can commiserate with the challenges and frequent lack of respect records managers have experienced is a special friend. For example, a records management Listserv completely independent of ARMA sprang up in the mid-1990s that discusses subjects related to records management. Rambunctious at times, the Listserv provides a way to remain connected while at work. Sometimes the discussion gets off-topic, and many posts are made in jest. The conversation includes frequent contributions from members in Australia as well as in Canada, and the U.S. Most

members of the Listserv are also ARMA members, and there are frequent discussions of the association. Many Listserv members meet at a party arranged at the annual conference. People place names and postings to faces and grow closer. While social networking is not the reason one becomes a member of ARMA, it is one of the reasons members remain members.

Because ARMA is the only place one can go to get a thorough understanding of records management, both as a profession and for complete, formal education in records management, the association has credibility and magnitude that is unparalleled worldwide. As the past decade has seen a rise in visibility for records management, membership has become even more diverse, including lawyers, accountants, information technology professionals, and compliance professionals. Instead of weakening the various types of networks, this has strengthened the various networks, both expanding and strengthening them.

Abstract

Throughout the millennial history and worldwide dispersion of the Armenian nation, libraries have played and continue to play a critical role. They have been instrumental in collecting and preserving the written works which embody the creativity of the Armenian mind, and making widely accessible recorded knowledge about the history, language, and literature of one of the oldest peoples on earth. This entry presents an overview of the establishment and development of libraries, museums, and archives, with special emphasis on those institutions functioning today in the Republic of Armenia.

INTRODUCTION

Throughout the millennial history and worldwide dispersion of the Armenian nation, libraries have played and continue to play a critical role. They have been instrumental in collecting and preserving the written works that embody the creativity of the Armenian mind; and making widely accessible recorded knowledge about the history, language, and literature of one of the oldest peoples on earth.

This entry presents the establishment and development of libraries, museums, and archives, with special emphasis on those institutions functioning today in the Republic of Armenia (Fig. 1). Following an historical overview and a brief discussion of Armenian libraries in the Diaspora, the entry introduces the academic, public, children's, school, and special libraries of Armenia within the regional context of the South Caucasus during the Soviet era and following the declaration of Armenia as an independent republic in 1991. Profiles of Armenia's major libraries are followed by a discussion of the Armenian Library Association, its activities, its role in continuing education, and its involvement in international and regional cooperation. A brief overview of Armenia's national archives and museums concludes the entry. Appendix 1 provides facts about Armenia, and Appendix 2 contains a chronology of Armenian libraries, archives, and museums.

History

The earliest information about Armenian libraries comes to us from the fifth-century historian, Ghazar Parpet'si, who tells us about the establishment at the Catholicosate of Ejmiatsin of a scriptorium ("gratun") which contained Armenian and Greek manuscripts. Surviving time, the elements, and hostile armies, copies of these and other texts can be viewed today in the "Matenadaran," the manuscript

library in Yerevan, Armenia, named after the visionary monk Mesrop Mashtots, who created the Armenian alphabet ca. 405–406 A.D.

Throughout the centuries, Armenian libraries continued to develop and flourish in centers of education, almost always as part of Armenian monasteries, and sometimes as separate facilities. Manuscripts were also stored in nearby caverns and in wall recesses. Entire libraries started coming into being. It is said that in 1170 the Seljuks destroyed a library in Siwnik consisting of 10,000 Armenian manuscripts. These encompassed religious subjects as well as philosophy, music, and calligraphy. The first Armenian academic libraries were established during the eighteenth and nineteenth centuries, away from the Armenian homeland, in Venice, Vienna, Constantinople, Tiflis (Tbilisi), and Moscow.

LIBRARIES OF EURASIA AND CENTRAL ASIA DURING THE SOVIET ERA

Prior to the 1991 break-up of the Soviet Union, its vast territory was administratively structured into 15 union republics (SSRs), which in turn contained 20 autonomous republics (ASSRs), 10 autonomous areas (or National Okrugs), 6 territories (Krais), and 130 regions (Oblasts), eight of which carried the qualifier "autonomous." The union republics and the various autonomous divisions were created to foster, or at least to contain, national or ethnic groups with distinct cultures, languages, or dialects. One may wonder about the origin of all these peoples, with their more than one hundred languages and diverse ethnic backgrounds. In nearly all cases, their established cultures predate both the Soviet and earlier tsarist expansions, which gradually drew them into a sprawling, contiguous Imperium.

Fig. 1 Map of Republic of Armenia, 1991.

Source: From CIA World Factbook 2008. https://www.cia.gov/library/publications/the-world-factbook/geos/countrytemplate_AM.html (accessed July 17, 2009).

During the seven decades of the Soviet regime, the closed societal nature of the USSR promoted an essentially Russian culture, with Russian as the language of administration, law, and military affairs, as it had been during the Tsarist Empire. Government policy toward the minorities, decreed by Lenin and carried on by Stalin and his successors, nominally allowed for the equality of the national languages with Russian, the right to self-determination and development, and the minorities guaranteed, and strongly encouraged, access to socialist federation within the union. There had been numerous long-term and short-term adjustments to the nationalities policy throughout the years, but difficulty always characterized the Soviet Union's attempts to ease or promote the merging of its people.

Libraries of the Soviet Union, as reflections of the cultural and societal institutions of the various countries and their peoples, were centralized and carefully controlled by the state, with the USSR Council of Libraries in Moscow as the ultimate authority on their governance, their resources, and services. Hierarchies of libraries were firmly established. Library directors were spared most of the decision-making. Norms for library work were prescribed with the same kind of central planning that decided in Moscow how many hectares would be planted in Armenia.

Librarians were told how many books of each kind must circulate in their library and filled out their reports accordingly. The usefulness of Soviet libraries was never

contested, nor were libraries especially threatened by closing. Librarians enjoyed a certain stature as "cultural workers." Their libraries, especially the large, important ones, were highly esteemed. Soviet librarianship was proud of huge collections, of the universal literacy in their state, and of excellent bibliographic control. The unmasking of Soviet libraries began during the last years of "glasnost," when librarians began to complain in their professional journals about the formalism of work, the necessity to inflate statistics, the collections full of redundant material that no one wanted to read. Some even began to question the premise that the librarian's most important job was to be a propagandist for the Communist party.

This was the general climate when the Soviet Union disintegrated in August 1991, with participants in the International Federation of Library Associations and Institutions (IFLA) Congress in Moscow as eye-witnesses. Instead of one rigid and homogeneous system, there suddenly were 15. In each case, librarianship had to reform and carry on, to choose what should be kept of the old ways, and to discard what should be thrown out with old party slogans.

The 1988 Earthquake

On December 7, 1988, a killer earthquake devastated the northern region of Armenia. The tremor affected territory of almost 30,000 sq. km. In a few short seconds, it took tens of thousands of lives, crushed by falling debris, and left half a million people injured, maimed, and homeless. It toppled the buildings of many social and cultural institutions, including libraries. Soviet President Mikhail Gorbachev cut short his visit to the United States to return to the earthquake site. Armenian communities world-wide sprang to their feet and worked feverishly to send humanitarian aid to their brothers and sisters in the homeland.

Three weeks later, at the American Library Association Midwinter Meeting in Washington, D.C., a resolution by its International Relations Committee was presented to the decision-making ALA Council, under the presidency of William F. Summers. On January 10, 1989, the Council responded swiftly and unanimously by establishing a \$5000 emergency fund and establishing the Armenian Earthquake Disaster Committee to help restore libraries and library services in the Armenian earthquake belt.

October 7, 1994, marked the inauguration of the Library Association of Armenia. Ten years later, the decennial conference of ArLA took place in Yerevan, with the participation of 119 delegates and 64 guests.

LIBRARIES IN THE REPUBLIC OF ARMENIA

The book has been considered a national treasure since the creation of the Armenian alphabet at the beginning of the fifth century of our era. Armenia's libraries have long been

the mainstay of its rich culture. They are considered as centers of education, surviving time, the elements, and hostile armies. Most of the contemporary libraries of Armenia were established during Soviet rule, from 1921 to 1991. Based on the Soviet formula of one library per 1000 persons, in 1975, there were approximately 3300 libraries: one-third of them public; one-third, school; and the rest, technical, trade union and others. A reorganization of the libraries took place between 1975 and 1980, as a result of which independent city, regional, and rural libraries were unified into 42 centralized library systems, serving three and a half million people. In 1989, the total number of libraries numbered 2883.

The Armenian Book Chamber was established on December 27, 1922. This institution registers and records all published works in the Republic, including books and brochures, periodical publications, posters, postcards, music scores, and maps. The Chamber has been publishing the current national bibliography, *Tpagrut'ian taregirk* = The Yearbook of Printing, since 1925.

With the collapse of the Soviet Union, the challenges of dramatic changes from relative plenty to economic instability and political volatility hit hard. Abridgement of services and reorganization were disturbing. While librarians thought and spoke in terms of their team efforts, unlike a team, they were discouraged from individual initiative and certainly from collaborative networking. The concept of librarians as controllers of information, rather than as facilitators of its flow, would be slow to change.

The work of libraries since the collapse of the Soviet Union has been difficult. Insufficient finances, the disintegration of the book acquisition system, deregulation of the price of books, social hardships, and the energy crisis have disrupted and brought to a halt library functions and services. Some libraries were closed, and the number of users decreased. Presently, efforts are under way to overcome the challenges, and ground is being prepared to move library life into the new technological age.

Academic Libraries

Academic libraries are divided into two groups. The first group includes the Armenian Academy of Sciences library network, consisting of a main library and 31 specialized libraries in its various institutes. The second group of academic libraries includes the libraries of the Republic's 12 state higher educational institutions. The largest of these is the Yerevan State University Library, which functions as the methodological and coordinating center for about 60 libraries affiliated with institutions of higher education in Armenia.

Since the Armenian Republic's declaration of independence in 1991, a few private and non-governmental universities were established and formed their own libraries. Notable among these is the Papazian Library of the American University of Armenia, a WASC-accredited affiliate of the University of California system.

Public Libraries

A well-organized network of public libraries is spread throughout Armenia. These libraries function under the auspices of the Ministry of Culture, Sports, and Youth, and are also accountable to their local governmental bodies. Their services are free of charge to the public. However, in the last decade, public libraries have adopted fee-based services, such as photocopying, computer training, and bibliographic searching.

Notable in the most recent developments have been increased efforts in grant-writing toward the establishment special library areas focusing on English language materials to raise awareness about the United States. These "American Corners" serve as regional resource centers for information and programs highlighting American culture, history, current events, and government.

Children's and School Libraries

Information services to young readers are provided in three types of libraries: separate children's libraries; Centralized Library System children's sections; and school libraries. The Yerevan Centralized Children's Library System, formed in 1979, consists of a Central Library and 14 branch libraries with a total of 350,000 volumes in 1994. This library system caters to 40,000 children annually. Every school has its own library. In the Republic there are 1349 school libraries, with over 18.4 million items, of which 10 million are textbooks. The methodological center of the children's and school libraries is Khnko-Aper Apor National Children's Library, established in 1932.

Special Libraries

In this category are scientific-research, medical institute, museum, and military libraries. Notable among these is the Republic's Scientific-Technical Library, under the Health Ministry. Established in 1946, this library has begun the task of creating and computerizing a network of 19 medical libraries, which primarily serve physicians, surgeons, and medical researchers. The Library of the Eghishe Charents State Museum of Literature and Art, established in 1954, contains books, ps, manuscripts, photographs, audiotapes, musical instruments, works of art and other realia, connected to the renowned literary giant.

PROFILES OF ARMENIA'S MAJOR LIBRARIES

National Library of Armenia

The National Library of Armenia was established in 1919, and subsequently named the Alexander Miasnikian State Library. The 1920s were a crucial period for the formation

and growth of the Library's collections, with the acquisition of items provided by the Lazarian Institute in Moscow, the Nersisian School of Tbilisi, the Armenian Benevolent and Armenian Publishers Societies of the Caucasus, the Yerevan Men's Gymnasia (established in 1831), and private contributions made by prominent scholars and intellectuals. In July 1990, it was renamed the National Library of Armenia (NLA) (Fig. 2). The largest library of Armenian books in the world, as of 2000, the collections numbered some 6.2 million items in Armenian, Russian and other world languages, available for on site use and loan to some 40,000 registered readers.

The first legislation regarding the national Deposit of Publications was adopted in February of 1924. Since 1925, the NLA has gained depository rights to a copy of every item published in Armenia. Presently, an amended and improved version of this law, reviewed and ratified in

1959, is in force. In addition to this function, the NLA also serves as the methodological center for all the public libraries in the Republic.

The Library's Old, Rare and Archival Literature Collection contains single copies of every Armenian publication. Its oldest book is the first printed Armenian book *Urbatagirk* (Friday Prayer Book, or, *A Book on Remedies against Witchcraft*), published in Venice in 1512 by Hakob Meghapart, the first Armenian printer. The Library also has a separate, specialized department for performing arts, cartography, music, and literature in world languages.

Beginning in March 2004, the NLA has begun issuing a monthly newspaper, *Hogevor Hayrenik* (*Spiritual Homeland*).

American University of Armenia Papazian Library

Soon after Armenia's declaration of independence in September 1991, the American University of Armenia, an affiliate of the University of California, opened its doors in the capital city of Yerevan. Offering a graduate program in engineering and business, the mission of the university was to prepare a new generation of leaders of the new democracy.

Established with a \$1 million endowment by Swiss-Armenian benefactors Pinna and Simon Arman Papazian, the University's library has evolved at a rapid pace, implementing contemporary Western-style methods of management and technology.

Since its humble beginnings in 1991, the Library has grown in capacity and readership, currently housing some 28,000 volumes in open stacks and serving over 9000 members—students, faculty, and staff of the University, as well as students, scholars from other institutions, and the community at large. With the American Embassy's USIS library collocated on the same site, a state-of-the-art library would be created to serve as a hands-on, Western-style prototype of what might be possible throughout the country and its existing more than 3000 multitype libraries. At first, the library would occupy a large space on the first floor of the University's building, formerly the site of Communist education headquarters.

What began as a single unit has now evolved into a small information resource network, together with the University's Legal Research Center and the Krikor Soghikian Public Health Reference Room.

Khanko-Aper National Children's Library

Named after a noted author and teller of children's stories, the Khanko-Aper Library was established in 1932 and celebrated its 70th anniversary in October 2003 (Fig. 3). Its mandate is to collect and develop Armenian children's literature. At the entrance to the library building is a sign, which urges children, "Every day, read one page from a new book." Open

to children from the age of 4 up until the 9th form, the Library's collections number nearly one half million items. Adults are allowed only if accompanied by a child.

National Academy of Sciences of Armenia Library (NAS RA)

The National Academy of Sciences of Armenia Library (NAS RA), which was established in November 1943 as an affiliate of the USSR Academy of Sciences, unifies scientific and research institutes, subsidiary services and the governing body of this state scientific organization. The Presidium of the Academy includes more than 50 scientific institutions and other organizations in five scientific divisions: Mathematical and Technical Sciences; Physics and Astrophysics; Natural Sciences; Armenology and Social Sciences; Chemistry and Earth Sciences.

The NAS RA Web site currently lists 71 full members, 54 corresponding members, 4 honorary members, 117 foreign members, 59 honorary doctors, and 180 deceased members.

The total number of the workers in the system of the Academy is 4395.

More than four million items can be found in the Academy's libraries, with more than half in the main library. Of these approximately one fourth are in languages other than Armenian and Russian. Annually, this information resource center serves some 20,000 users. The Library is organized to serve the needs of its members and is also part of the Consortium of Libraries engaged in automation.

Republican Scientific-Medical Library (RSML)

In 1990, the RSML of the Ministry of Health of Armenia, in collaboration with the Fund for Armenian Relief, created a vision of a national library network supported by information technology. This vision incorporated four goals: (1) to develop a national resource collection of biomedical literature accessible to all health professionals; (2) to develop a national network for access to bibliographic information; (3) to develop a systematic mechanism for sharing resources; and (4) to develop a national network of health sciences libraries. The RSML has achieved significant progress toward all four goals and has realized its vision of becoming a fully functional national library, now providing rapid access to the biomedical literature and training health professionals and health sciences librarians of Armenia in information system use.

Yerevan State University Library

The University's library, with its 10 divisions, is one of the largest libraries in Armenia, with 12 specialized reading rooms in a number of faculties, housing collections constantly enhanced by the further addition of academic and scholarly literature, and a division of antiquarian and rare books dating from the beginning of the seventeenth century. Over 14,000 readers, students, lecturers, postgraduates, researchers, and other affiliates of the University have access to the University collection of approximately two million books.

Among the University's 100 partners in the international exchange of books are the United States Library of Congress, the National Library of the Russian Federation, and university and academic libraries in the United States, France, Germany, Italy, Argentina, and elsewhere. In 1989, the Library received an award as a first-rate scholarly library.

LIBRARY EDUCATION

Degree programs in library science were established in Yerevan State University in the 1950s. Since 1969, librarians are being trained at the Yerevan Armenian Pedagogical Institute, in a 4-year program leading to a diploma in library science, with 25 graduates each year. The curriculum includes both general subjects and technical courses in library and information science. The Holy See of Ejmiatsin Library College has been offering secondary library training to its seminarians since 1931.

The Armenian Library Association (ArLA) has also taken responsibility for continuing professional education for the Republic's librarians and other library personnel, with funding from various sources, such as IREX, OSI, and the Carnegie Corporation, among others. In addition to continuing education courses, consideration is being given to the establishment of a graduate program of information studies offering master's and doctoral degrees at the American University of Armenia.

ARMENIAN LIBRARY ASSOCIATION, 1994–2008

The first steps toward creating a professional library association in Armenia were taken toward the end of the 1980s. During the same time period, the first library associations were also being established in Moscow and St. Petersburg. In the Baltic States librarians re-established their library associations, which had been forbidden during the Soviet years.

Based on a strong, millennial tradition of the book as a national icon, the libraries of Armenia had continued to thrive during the 70-year Soviet era, with a total of 2883 multitype (public, academic, higher education, technical, health, school, and children's) libraries in 1989.

The tiny land-locked republic of the Caucasus was still reeling from the aftershocks of the earthquake and the effects of hastened democratization, exacerbated by the chokehold of an economic blockade from neighboring Azerbaijan to the east and Turkey to the west.

Libraries had stayed open during the winter, even when schools and businesses were closed. Of Armenia's 7000 library workers, 53 librarians, representing 10 of Yerevan's leading multitype libraries, participated in a short course, entitled "Strategic Planning for Armenia's Libraries," offered through the Extension Department of

the American University of Armenia, from May 23 to June 9, 1993.

The librarians participating in the course were organized into a planning group, representing the major libraries of Armenia, took active part in the following goals:

- To develop the constitutional structure of the Armenian Library Association
- To convene the inaugural conference of the Association in 1994
- To develop strategic plans for the improvement and automation of its 3000 multitype libraries.

On October 7, 1994, the Armenian Library Association conference was convened in the National Library of Armenia. The Inaugural Conference participants were 119 delegates from all parts of the Republic and 64 guests, including four representatives of the American Library Association. Representing all major research, academic technical, special, public, and children's libraries of the Republic, and with delegates from nearly all of the nation's regional libraries, the participants were 100 women and 19 men.

The initiators of Armenia's new Library Association were the National Library of Armenia, the Academy of Sciences Library, the Republican Scientific-Medical Library, the Republican Scientific-Technical Library, the Khnko-Aper Republican Children's Library, the Avetik Isahakyan Yerevan City Central Library, and the Republic of Armenia Ministry of Culture.

The conference approved the Association's constitution and elected a 21-member administration. Nerses Hayrapetyan, currently Director of the U.S. Embassy's Information Resource Center, was elected the first president of the Library Association. Upon examining the status of library work in the Republic, the inaugural meeting approved the mission statement submitted to the library workers, the intellectuals, and the public, which states:

We, the participants in this inaugural meeting, are applying to our co-workers and to all those supporters of library work, asking them for their enthusiastic support of the goals of the Association. The free development of our national culture and knowledge depends on the expression of our individual intellectual strength. Libraries, as centers for the preservation of national spiritual values, moral upbringing, cultural and historical traditions, must assume the place of utmost importance in the sphere of illumination and education.

See the Web site of the Armenian Library Association (ArLA) for organizational constitution and by-laws.^[3]

The Association was officially registered with the Republic of Armenia Ministry of Justice in March 1995 under the name "Library Association of Armenia." On March 6, 1998, by decision No. 9/1–3 of the Ministry of

Justice, the organization was reregistered under a new name, "Armenian Library Association (ArLA)."

During the 10th anniversary of ArLA, October 7 was designated as National Library Day, with the motto: "New Century; New Libraries."

The ArLA and the National Library of Armenia play key roles as regulative, normative, and cultural-cognitive institutions. They are the leaders in the Consortium of Armenian Libraries, currently involved in automation of the nation's information institutions, and also as collaborators with the libraries of the neighboring South Caucasus republics of Azerbaijan and Georgia.

Association Activities

Since its establishment, the Association has had the purpose of utilizing the specialized abilities of its members for the development of library work in Armenia, to improve access to services and resources by means of modern methods and computer technology.

Toward this end, Association members have enthusiastically participated in approving government documents concerning library work, developing library legislation. The Association has organized and implemented numerous and various types of library programs (Table 1), as follow:

- The Association also implements various types of large and small programs. Among these should be mentioned the subscription for Armenia's libraries, through the support of the South East Florida Library Information Network (SEFLIN), to the EBSCO publications company's EIFLDirect program
- Taking into account the low probability of Internet access in Armenia, approval was given to secure CD and DVD subscriptions for libraries. From January to June 2000, through a "Technical means for participants in the EIFLDirect program" grant, nine regional libraries acquired DVD players.
- In cooperation with the International Research and Exchanges Board (IREX), the Armenian board of the Internet Access and Training Program is currently preparing to mount individual pages on the World Wide

Web for the Armenian Library Association and regional public libraries.

The Association and Continuing Education

One of the main priorities for the Association is the organization of continuing education courses for Armenian librarians (Table 2).

The Association cooperates with Armenia's only institution of higher education for the preparation of library specialists, the faculty of library science and bibliography of the Khachatur Abovian Armenian Pedagogical University. The Association has organized lectures by American library specialists for the student body.

Many of the Association's members participate in international scholarly conferences, seminars, and retrainings. Numerous representatives of the Association are participating in the largest conferences convened throughout the Commonwealth of Independent States, the annual conferences in Crimea. In December 1998, in cooperation with the Russian Library Association, St. Petersburg Library Association member, Karine Arabyan participated in the planning of the seminar, "The role of special organizations in the work of shaping the library into a modern facility." Several members of the Association have also participated in the Open Society Institute Central European University, Bucharest, summer school program.

International and Regional Cooperation

One of the goals of the Association is to participate in international library cooperation (Table 3). Toward that end, in 1995, the Association applied to the governing bodies of IFLA (International Federation of Library Associations and Institutions), indicating its interest in membership in that most important international library organization. In August 1996, during the 62nd IFLA congress in Beijing, the Armenian Library Association was elected as a national association member.

July 10, 1996	ArLA, National Library of Armenia, Yerevan State University Scientific Library, Khnko-Aper Children's Library, Republican Scientific-Medical Library, and others	Round table: "Status of Armenia's libraries"
October 1994–present	ArLA	Annual conference

Table 2 The Armenian Library Association and continuing education.

Date	Participants	Program
March to June 1998	78 library workers from nine libraries in Yerevan	4-session course: "Education of Library Workers"
October 21–24, 1998	18 representatives from nine regional libraries of the Republic	3-day seminar
March to April 1999	60 library workers	3-week training course, in collaboration with Ararat Republican Regional Library

The Association is registered in four of IFLA's working group sections: national libraries, scientific-technical libraries, national libraries, and information technologies.

Regional relations with Georgian and Azeri library workers began in 1996–1997. During those years, after the break-up of the former Soviet Union, the first immediate linkages among the three nations' library workers took place.

As a result of such collaborative efforts, several librarians from Armenia have received fellowships to study library and information science in the United States so that they can return to the homeland and train their colleagues in new ideas and techniques for improved library service. They have taken courses at the University of Illinois-Urbana/Champaign, Mortenson Center; University of Pittsburgh; and Louisiana State University, among others. They have also served internships in several U.S. libraries, including the Library of Congress, Los Angeles Public Library, and the Bakersfield Public Library, in California.

ARMENIAN LIBRARIES OF THE DIASPORA

With the loss of statehood and the tragedy of the first genocide of the twentieth century, Armenians were compelled to leave their homeland on the Armenian plateau, east of the Euphrates River. Because of their affinity for global exploration and adaptability to new environments, they settled in all corners of the world, carrying with them and re-establishing their cultural institutions in émigré colonies. They built churches, founded schools and libraries, and established printing presses, thus bridging the past and present of their unique heritage.

In the United States, as early as 1875, the quest to preserve the language and instill the history of Armenia led various groups to organize reading rooms and lycea, usually

in a church, library, or office building. There, Armenian and English-language periodicals and books were made available. College students and visiting intellectuals spoke to reading-room subscribers in Armenian on matters of current political and literary interest. In 1890, before the city of Fresno, California, had a public library, the Fresno Armenian Library Union was organized, an example emulated by Armenians in the California cities of Fowler and Los Angeles. The desire for a public library was so ardent that even the tiny Armenian community in Kenosha, Wisconsin, raised funds at an Armenian wedding in 1905 for an Armenian reading room.

The number of multitype and specialized Armenian libraries in the Diaspora today is significant. A listing of no fewer than 302, surveyed for their holdings of books printed between 1512 and 1800, can be found in a compilation prepared by three bibliographic scholars and published under the title *The Armenian Book in 1512–1800* (Yerevan: 1988). Notable among them are the libraries of the Mekhitarist Order in Vienna, Austria, and San Lazzaro in Venice Italy; the Monastery Library of Isfahan, Iran; and the Calouste Gulbenkian Library of the Armenian Patriarchate of Jerusalem.

In its latest edition, the *Armenian American Almanac* (Los Angeles: 1995) devotes an entire section to libraries in the United States and Canada which house Armenian collections, categorizing them as organizational and research, public, school, college and university, church and seminary, special and private collections.

NATIONAL ARCHIVES OF ARMENIA

The Web site of the National Archives of Armenia (<http://www.armarchives.am>) provides a detailed chronology of significant events from the establishment of the Archives

Table 3 ArLA and regional and international cooperation.

Date	Participants	Program
May 5–6, 1997	ArLA with 15 Georgian librarians and two from the United States	Regional conference: "The Library as an information center: A new model" took place in Yerevan
May 5–8, 2001	Representatives of ArLA, Library Associations of Azerbaijan, Georgia, and American Library Association	Regional conference, Tbilisi, Georgia: "Strengthening Library Associations in the South Caucasus"
September 27–30, 2002	Representatives of ArLA, Library Associations of Azerbaijan, Georgia, and American Library Association	Regional conference, Yerevan, Armenia: "The Role of Academic Libraries in Fostering Civil Society"

in 1921–2006. Also included are summaries of organizational structure, archives legalization, description of holdings, and information about archives of state bodies and organizations in the Republic of Armenia and the Autonomous Republic of Nagorno-Karabakh. The *Law of the Republic of Armenia Concerning Archive Keeping* was accepted on June 8, 2004 and its 10-chapter content can be accessed online.

MUSEUMS OF ARMENIA

A visitor to Armenia will be amazed by the beauty of its natural environment, often described as “a museum of antiquities,” with its mountains, caves, rivers and lakes, and ancient monasteries and fortresses. “Armeniapedia.org” offers brief descriptions of some 24 museums in the capital city of Yerevan and environs. “TACentral.com” provides a more extensive list of museums in Yerevan and 52 museums throughout the Republic.

The Armenian State Teachers University named for Khachatur Abovian offers Master’s Courses in Museology and Protection of Monuments.

The following table lists the Yerevan museums by name and summarizes the regional museums by quantity (Table 4).

Mesrop Mashtots Institute (“Matenadaran”) of Ancient Manuscripts

After its confiscation by the Soviets, the scriptorium of the Holy See of Ejmiatsin, which housed an extensive collection of Armenian and Greek manuscripts, became the basis for the “Matenadaran,” the manuscript library in Yerevan, Armenia, named after the visionary monk Mesrop Mashtots, who created the Armenian alphabet ca. 405–406 A.D.

The “Matenadaran” is one of the oldest and richest book depositories in the world and, as such, it is listed on the UNESCO Memory of the World Register Nominated Documentary Heritage (Fig. 4). Its collection of some 17,000 manuscripts includes almost all the areas of ancient and medieval Armenian culture and sciences—history, geography, grammar, philosophy, law, medicine, mathematics-cosmography, theory of calendar, alchemy-chemistry, translations, literature, chronology, art history, miniature, music and theatre, as well as manuscripts in Arabic, Persian, Greek, Syrian, Latin, Ethiopian, Indian, Japanese and others. In this cultural heritage repository, many originals, lost in their original languages and known only because of their translations into, have been saved from disappearance.

Genocide Museum and Institute

Principal activities of the Armenian Genocide Institute and Museum include: Scholarly exhibitions of historical-

German scholars devoted to the memory of Armin Wegner, the noted German writer and journalist, a witness of the Genocide. In 1998, the Museum sponsored an international conference dedicated to the 140th anniversary of the birth of Johannes Lepsius, a great friend of the Armenian people. The Museum also conducted international conferences in 1999 devoted respectively to Henry Morgenthau, United States Ambassador to Turkey during the Genocide, and Anatole France, famous French author and supporter of the Armenian cause. On April 23, 2001 it convened an international conference on the occasion of the 86th anniversary of the Armenian Genocide, attended by scholars from all over the world.

Children's Art Gallery and Aesthetic Center^[5]

"The World through the Eyes of Children" is the name of an exhibit that opened in the Artists' Union of Armenia in 1968 on the initiative of art expert Henrik Igitian. Soon after, the Children's Art Gallery was founded in 1970 and was later reorganized as the Museum of Children's Art. The Gallery has a permanent exhibit and a showroom where individual and thematic exhibitions are organized. It accepts children's paintings from all over the world and exchanges some of its own with institutions abroad. In 1975 the British Prime Minister Harold Wilson donated 100 paintings by British children

to the Gallery. The Gallery has about 200,000 exhibits (paintings, sculptures, graphic works, ceramics, appliqué, carpets, rugs, and embroidery) from about 120 countries of the world. Artwork from the Museum's stock has been sent to exhibitions staged in the United States, France, Italy, Czech Republic, Slovakia, Japan, and elsewhere, and shown at the Children's Paintings Exhibition "From Fuji to Ararat" displayed in 1997 in Yerevan at the gallery of the Armenian Painters Union, where 400 paintings from 160 countries were displayed. With the founding of the National Aesthetic Education Center in 1978, the Gallery became the Armenian Museum of Children's Artwork (with branches in Gyumri, Vanadzor, Goris, Kapan, Sevan, Spitak, and Meghri). The Center also has painting and decorative applied arts studios, a symphony orchestra, theaters, and a film studio. The Children's Art Gallery was the first museum of children's artwork in the world.

CONCLUSION

This overview of Armenia's libraries, archives, and museums aims to introduce these information institutions against a millennial historical backdrop, within a socio-cultural and organizational context, in order to demonstrate their importance in preserving, promoting, and

perpetuating Armenian patrimony, cultural heritage, and ethnic identity.

Armenia was a full participant in the World Summit on the Information Society in Geneva (2003), with President Robert Kocharian and his staff representing the Republic. All of the documents from the Summit regarding Armenia are available on-line in English and Armenian. The Republic was also represented at the Tunis World Summit in 2005.

The Armenian Library Association, with its National Library Day motto: “New Century; New Libraries,” promises to sustain itself and grow as an advocate for the Armenian Republic’s libraries and librarians. Through its participation in the international arena, it has become an active participant in the globalization of its libraries. Future plans for library, archival, and museum specializations include research on educational reform in the South Caucasus, with an aim to establish an integrated graduate information studies program and training center for the region.

APPENDIX 1

 Republic of Armenia = Hayastani Hanrapetut’yun

Government

National: Republic with a unicameral National Assembly (Parliament—131 seats); 5-year term for President; 4-year term for Parliament; universal suffrage; 18 and older (CIA World Fact Book, 2008)

Official Languages: Armenian is the primary official language (97.7%); Yezidi, 1%; Russian, 0.9%; other; 0.4% [2001 census] (CIA World Fact Book, 2008)

Capital City and Administrative Divisions: Yerevan and 11 *marz-es* (provinces)—Aragatsotn, Ararat, Armavir, Geghark’unik’, Kotayk’, Lorri, Shirak, Syunik’, Tavush, Vayots’ Dzor (CIA World Fact Book, 2008).

Legal System: Based on civil law system. Has not accepted compulsory ICJ jurisdiction (CIA World Fact Book, 2008).

Key Dates: September 21, 1991 (Independence from Soviet Union) (CIA World Fact Book, 2008)

People and Economy

Total Population: 2,968,586 (July 2008 est.); Rank (World Bank): 131 (2007 est.) (CIA World Fact Book, 2008)

Major Ethnic Groups (%): Armenian (97.9%); Yezidi (Kurd) (1.3%); Russian (0.5%); other (0.3%) (2001 est.) (CIA World Fact Book, 2008)

Religious Affiliation (%): Armenian Apostolic (94.7%); other Christian (4%); Yezidi (monotheist with

elements of nature worship) (1.3%) (CIA World Fact Book, 2008)

Gross domestic product (GDP in 000s US \$ and rank): \$17.15 billion and 111

(2007 est.) (CIA World Fact Book, 2008)

GDP Per Capita (US \$ and rank): \$4,900 and 111 (2007 est.) (CIA World Fact Book, 2008)

Education

Adult Literacy Rate: 99.6% M; 99.0% F (2005 regional avg.) (CIA World Fact Book, 2008)

Preprimary School Enrollment: NA/29% M; NA/27% F (2005 regional avg.) (CIA World Fact Book, 2008)

Primary School Enrollment: 101% M; 100% F (2005 regional avg.) (CIA World Fact Book, 2008)

Secondary School Enrollment: 91% M; 87% F (2005 regional avg.) (CIA World Fact Book, 2008)

Tertiary School Enrollment: 25% M; 27% F (2005 regional avg.) (CIA World Fact Book, 2008)

Higher Education Enrollment: (number of institutions—16 State, 72 non-State Universities; 42,505 and 19,755 students, respectively)

Information Infrastructure and Institutions

Number of Books Published: 516 (1999) (UNESCO – UIS, 2008)

Circulation of Daily Newspapers (per 1000 inhabitants): 7.60 (2004) (UNESCO - UIS, 2008)

Radios (per 1,000 inhabitants): 850,000 (1997) (CIA World Fact Book, 2008)

TV Sets (per 1,000 inhabitants): 825,000 (1997) (CIA World Fact Book, 2008)

Films (number produced and seats per 1,000 inhabitants): 38.70 (1995) (UNESCO - UIS, 2008)

Internet Hosts (total): 8,270 (2007) (CIA World Fact Book, 2008)

Internet Users (total): 172,800 (2006) (CIA World Fact Book, 2008)

APPENDIX 2

Chronology of Armenian libraries, archives, and museums

Dates	Event
301 A.D.	Armenia accepts Christianity as state religion
405–406 A.D.	Mesrop Mashtots creates the Armenian alphabet, launching the Golden Age of Armenian literature (5 th century), and establishment of monastic libraries and centers of education

Art Galleries

Daniel C. Danzig

Consultant, Pasadena, California, U.S.A.

Abstract

The transition of the support structure for the arts from one of patronage to a primarily market-based environment provided an opportunity for art connoisseurs to establish private commercial art galleries. With the growth of the art market, the gallery system has developed into the primary enterprise for distributing art, as well as the dominant venue for introducing and presenting new art. Art galleries reflect the diversity in the art world and are similarly differentiated in terms of high and low, popular and elitist, avant-garde, and commercial. This entry defines the ideal-typical art gallery and describes its operations and role in the distribution of art. The qualities that distinguish galleries are situated within the cultural hierarchies of the art world as a way to better understand the various roles of art galleries within an integrated, but stratified system for the production and consumption of art.

INTRODUCTION

In the broadest sense, an art gallery is any architectural space utilized for the display of art or artifacts. The Western concept of the gallery originated during the Renaissance when noble residences featured colonnades, balconies, and eventually entire rooms for displaying art, antiquities, and cabinets of curiosities. These galleries were primarily private affairs, functioning as symbols of wealth, status, education, and taste for the benefit of the aristocracy and cultured elite. Only in the eighteenth century did public spaces begin to be designated as exhibition galleries for art, most often within institutions such as academies, universities, museums, libraries, and other civic organizations. (For a history of the establishment of museums see Bazin^[1] and Impey and MacGregor.^[2]) Thus, a large museum is generally a collection of galleries, with each exhibition space often dedicated to a specific period, discipline, genre, artist, or theme.

But art galleries are more than exhibition spaces: they are also organizations in and of themselves, and when we think of art galleries today, particularly in the United States, we generally refer to privately owned, commercial businesses operating as retail enterprises that buy and sell works of art.

As with any creative endeavor, the arts are measured in degrees of competency, excellence, and significance, and art galleries reflect these distinctions. Galleries can be located on a continuum between art created for the sake of aesthetics and expression at one end, and art produced for its marketability on the other. The paradox of the contemporary art world lies somewhere along that stretch of multiformity, a balance, (some would say compromise), between artistry and success.^[3] That is, the art world is a tiered system that distinguishes galleries by those that handle fine art and high culture from those that promote

commercial art and popular culture. Fine arts galleries are closely allied with museums, curators, auction houses, and others in the international art market, while commercial galleries lean toward interior design and decoration. The majority of galleries are a composite, yet the ideal-typical gallery conforms largely to the top-tier model: a large, minimalist white room, single works of art, and dramatic lighting characterize the common notion of an art gallery. (For an interpretation of the aesthetics of display in art galleries and exhibit design in museums see O'Doherty^[15] and Staniszewski.^[4])

This entry begins with a definition of the quintessential contemporary art gallery and its role in the presentation and distribution of contemporary art. Although the model gallery is not unusual, a variety of specializations exist among them, while others appeal to quite different markets altogether and operate with dissimilar business models and organizational structures. Differentiation among galleries, particularly for those involved in the international contemporary art market, is situated within the cultural hierarchies of the art world as a way to better understand the various roles of art galleries within an integrated, but stratified system for the production and consumption of art. A brief history of the development of the modern art market places the establishment of art galleries in context. The diversity within the field is described to provide an introduction to the range of variance.

DEFINITION

Art galleries are, basically, retail establishments exhibiting and selling original works of art. More importantly, however, art galleries facilitate the distribution of art through a cooperative enterprise, providing art

collectors a mediated and authoritative source for acquiring works of art, while at the same time integrating artists into society by helping them transform their vision, talent, and investment in materials into financial support for their creations, by converting aesthetic value into economic worth.^[5] The following description more specifically represents what is, perhaps, the archetypal art gallery within this system, albeit a top-tier one selling art by living artists in the international contemporary art market.

Operations

An art gallery is a small business, generally a sole owner/director supported by a few staff.^[6] The dealer or gallerist, as the owner is known, represents a select group, or stable of artists, usually around 20, and exhibits their work publicly. Galleries present an annual schedule of six to ten changing exhibitions, including solo shows that feature the work of an individual artist, or group exhibitions of multiple artists organized by artistic theme or affiliation.

Exhibitions are an opportunity to not only present each artist's new work, but also, more importantly, to promote the artists to art critics and museum curators. Dealers then use their confirmation of artistic merit to cajole collectors to purchase artwork. Ideally then, growing collector interest, particularly among museums, bolsters the artist's reputation, which in turn leads to appreciating value for their work, and ultimately results in a sustained artistic career. Financially, the gallery generally assumes all the expenses associated with presenting and publicizing the art and artist, and in return receives a percentage of the sale price. The standard commission is 50%, although individual business arrangements vary. Dealers may also purchase their artist's work outright—artist stipends are less common today—and then resell it, making an additional profit if the value increases over time.

As promoters, dealers must be able to convince others that their artists have the potential to become important in the art historical context, and consequently collectible. As part of the promotional process for building an artist's reputation, dealers advertise in the major art magazines, e.g., *Art in America*, *Artforum*, *ArtNews*, (these influential trade journals are an important resource for current events and a leading indicator of trends in the international contemporary art market) and mail announcements of exhibit openings to a large, but targeted audience. Dealers then begin to establish a demand in the market, or a following for their artists by encouraging critics—who hopefully will write positive reviews and topical articles—and curators—who may include their artists in museum exhibitions and/or collections—to also recognize and acclaim an artist's importance.

A collector's reputation can also affect the reputation of the artists they collect. Dealers are able to increase the value, both economic and aesthetic, of an artist's work by placing it in a high profile, well-respected collection, a

museum for example. Dealers actively cultivate their collectors, be they individuals, corporations, or museums by networking and providing value-added services such as art education, investment counseling, appraisals, and financing in order to maintain this relationship. Unlike a typical commercial business where all buyers are welcome, generally on a first-come-first-served basis, art dealers may even restrict sales, if demand allows, of important artwork to their best clients in an effort to maximize the benefits. Establishing prices for art works and increasing their value over time is a complicated formula involving more than just basic supply and demand, but also, as with other luxury goods, more intangible factors as status, reputation, provenance, and fashion. (For more on the economics of art see Robertson.^[26])

Role

As the primary distributor for art, galleries function in a somewhat similar capacity as both publishers and book-sellers do for literature. However, the role of the art dealer is often not limited to publicity and sales, but may also include discovering and premiering new artists, and directly brokering the relationship between artist and collector. In this capacity, an art dealer is perhaps more like a literary agent. Dealers constantly wade through a sea of new artists, often received as unsolicited submissions to the gallery. The dealer evaluates an artist's work, rejects those they regard as unworthy of exhibition and unlikely to advance, and accepts for a trial run those whom they feel have potential. The artists who fail to garner critical notice, or lucrative sales, are released, while those that succeed are retained and promoted. Each dealer has individual artistic preferences, or aesthetic points of view, and chooses artists to represent accordingly.

Museums rarely exhibit work by young, untested artists, so galleries function as the proving ground for emerging artists—although rarely lauded for providing a public service, art galleries significantly enhance cultural life by presenting free public exhibitions of art, much of it for the first time. Since galleries are the dominant venue for introducing and presenting new art, dealers also assume the role of gatekeeper,^[6] first, by initially deciding which works will be exhibited and which will not, and second, by being as selective as possible about the type of collectors to whom they are willing to sell, particularly when it comes to their best artists. One way to evaluate an art dealer, as art critic Lawrence Alloway^[7] sees it, is to “. . .measure dealers. . .by their power to sell art, infiltrate museums, and generate art criticism.”

Art dealers who follow this model for seeking out the rising stars of the art world are more interested in choosing unrecognized artists they feel are breaking new artistic ground, ones that are truly avant-garde, than in artists who may be more of sure thing financially. While some dealers prefer to represent these emerging artists, others

favor artists who are more established and already recognized, and consequently their work is more likely to sell. Still other galleries do not even represent living artists, but only historical artwork. These differences in focus or specialization among galleries are only some of the ways in which they vary. Regardless of which type of gallery a dealer develops, the style is often a reflection of the owner's individual tastes, goals, and values, as is the case with most small independent businesses. (For more on the idiosyncrasies of individual dealers see Klein.^[8]) So while the description above represents the common idea of an art gallery, it does not sufficiently describe all art galleries.

DISTINCTION

Perhaps the most common way to distinguish one type of gallery from another is by the quality of the artwork exhibited. This method is, however, highly subjective and invariably leads to applying something like a high- vs. low-culture framework. (For an investigation of high vs. low culture see Gans^[9] and Bourdieu.^[10]) The top tier of galleries adopting this criterion present only museum-quality art, i.e., art that meets rigorous standards regarding the artist's education, aesthetics, art historical significance, etc., and which could conceivably be exhibited in an art museum.^[3] A second criterion for the quality of art and the galleries that handle it would be investment potential. These two benchmarks distinguish elite galleries from more commercially-oriented galleries, frame shops with art displays, and similar retail stores offering more popular, or less aesthetically challenging decorative art and graphics, mass-produced posters, functional crafts, and tourist mementos.

The 2002 US Economic Census^[11] reported more than 6000 galleries in the United States; however, the number handling museum-quality art is much smaller. The national art magazine *Art in America* publishes an annual guide to artists, arts organizations, and art services. In 2007 it provided free listings for just over 4000 commercial galleries.^[12] The classified exhibition directory, *Gallery Guide*, included just over 3000 paid gallery listings the same year.^[13] The number of galleries in invitational organizations is much smaller: Art Dealers Association of America lists only 170 members, all of which are top ranked and most of which are located in New York. The four major national associations of art and antique galleries in the United States (see Resources, below), represent approximately 400 members, or less than 10% of the total number of establishments. These gallery groups operate in all three economic markets, and handle the great majority of the most sought-after museum, and investment-quality art represented in major museum exhibitions and collections.

Among these 400 or so elite galleries, distinctions become more complex and involve the dealers' access to,

and levels of, participation in social networks, and their degree of professional reputation. Artist Martha Rosler^[14] recounts a conversation with a dealer who pointed to his coffee table and said, "See this table? That's the art world. And you're either on it or you're not." Only a small group of galleries meet the top criteria, and have achieved influence and power within the small network of players in the fine arts.

THE ART WORLD

Since the middle of the twentieth century, art galleries have operated as part of what is broadly referred to as the art world. Art critic Lawrence Alloway^[7] describes the art world as a system: an integrated network of artists, dealers, critics, museum curators, historians, collectors, and staff affiliated with for-profit and nonprofit galleries, museums, academies, publications, auction houses, government cultural agencies, etc. Within this system, art moves through various spheres or stages as its audience changes. Artworks are first created in the artist's studio, where the initial audience includes the artist's friends. The audience expands to a specialized, interested public when the work is presented at a gallery exhibit. Works that are sold then reach the collector's circle. Museum exhibits, and publication in catalogs, magazines, and newspapers, expand the audience to a broader public.

Sociologist Howard Becker^[5] describes the relations between artists and audiences in terms of "patterns of cooperation." He too sees the art world as an interdependent system or network of social relationships that define the production and consumption of art. Rather than seeing artists in the cliché of isolated, romantic mythically gifted individual creators toiling alone in their studios, they are part of integrated spheres of colleagues, styles, movements, regions, etc., their efforts being shaped by interactions among various participants. For Becker, art worlds are composed of all those whose cooperation and coordinated collective activities, utilizing a set of shared conventions, are required to produce, distribute, and consume art, rather than any essential quality or inherent characteristics of the art work itself. Membership in the art world is, at least in the commercial sector, self-determined, since there are no regulations that control entry into the field, and no required training, certification, or licensing for art dealers.

Therefore, there is no singular art gallery, beyond the basics of an architectural space for exhibiting art and a business engaged in selling it. While general occupations and affiliations may be easily attributed to the art world and membership within those categories seem clearly determined, for example, any business calling itself an art gallery is an art gallery, the sheer number of galleries and artists encourages not only specialization and market segmentation, but hierarchies as well that help distinguish the relative position of participants and organizations.

For many, the extent to which art galleries engage in elitism is problematic. Artist and art critic Brian O'Doherty's^[15] important series of critical essays on contemporary galleries as exhibition space captures what has become for many, particularly artists, a persistent problem with galleries, chiefly that the "gallery space still gives off negative vibrations." Three perceptions contribute to the bad connotations, according to O'Doherty, first "esthetics are turned into a kind of social elitism—the gallery space is exclusive. . . [second] esthetics are turned into commerce—the gallery space is expensive. . . [and third] without initiation. . . art is difficult."

For better or worse, fine art continues to function as, or at the very least is still perceived symbolically to be a luxury commodity that conveys status. As a result, it is often classified in a stratified pyramid of cultural production and consumption that defines works of art in terms of high and low, popular and elitist, avant-garde and commercial.^[3] Determining the value of that status is often quite subjective and it is generally established by complicated interactions among various, but unequal art world constituents.^[10]

FROM PATRONAGE TO MARKET

Although there has been an arts trade for as long as there have been artists and patrons, the practice of art as commerce is a product of the modern era.^[16] Patronage had been the dominant system for supporting the arts up until the seventeenth century. An art patron, that is, the church, court, or aristocrat, would commission works directly from artisans, who usually worked as part of a guild. The patron often dictated the subject, if not the style and method, and effectively controlled the market, such as there was one. The Medici family of Florence, for example, was a significant art patron during the Renaissance. Again, these artworks were symbols of the patron's prestige and their sponsorships required a certain amount of knowledge about the subject, usually history or religion, as well as about aesthetics and craftsmanship. Eventually, however, structural changes that fostered the development of bourgeois society made possible shifts in the production and consumption of art from the aristocracy to a developing upper-middle class, from commissioned patronage by the elite to public participation in a commercial market.^[17]

For these new admirers, art was mostly acquired through inheritance, as gifts or travel mementos, or at estate auctions, rather than directly through commissions. Art entered the marketplace as early as the seventeenth century, with the Dutch art trade being one of the earliest examples.^[18] Shops and merchants of various types began to sell paintings and prints, but the art was more often intended as interior design pieces along with furniture, decor, and curios, recognized more for their craftsmanship and not yet generally regarded as "high" art. Similarly, as

the demand for art grew, especially among an aspiring new class of merchants, tastes changed as well, with a growing preference for landscapes, portraiture, and domestic scenes, as opposed to the grand historical narratives and religious allegories commissioned by the state or church. To meet this demand, the number of artists increased dramatically, and so did various academic and artist associations, which began organizing expansive public art exhibitions. The most renowned during the seventeenth and eighteenth centuries was the Salon, the official art exhibition of the Académie des Beaux-Arts in Paris, France, with equally important exhibitions organized by the Royal Academy of Arts in London, which provided an opportunity for both burgeoning groups to connect. As art schools and academies were established and artists trained and professionalized, art movements with specified philosophies, styles, and manifestos developed, and consequently, interpretation, criticism, and the historicization of art. Soon, what was and was not art became formalized, specialized, and debatable. For those who were unfamiliar with art history and these new artistic trends—the cultural avant-garde—the need, or at least the opportunity for an arbiter between artists and this new audience developed. And it was not long before connoisseurs entered the world of art in order to help negotiate an exchange and make a profit for themselves along the way.^[19–21]

The developing moneyed classes of the nineteenth century, in the United States in particular, wanted to establish their social status by building their cultural capital in addition to their increasing economic fortunes. However, most had not inherited a history of arts patronage, and therefore had little experience acquiring an art collection. This became an opportunity for entrepreneurs to insert themselves as intermediaries and aspirant brokers in art between now-independent artists and the nouveaux patrons-cum-collectors. With the novice collectors' aspirations in mind, the galleries tended, early on, to mostly feature paintings by well-established, prominent European masters, rather than unknown provincial American artists. The dealers recognized that consecrated works would more readily convey the sophistication of their collectors. The Duveen Brothers was a prominent gallery at this time. But as the interest in collecting art grew and art galleries flourished, Old Masters and other prominent art became harder to acquire relative to the growing demand, so dealers increasingly began to feature art work by living artists in addition to the classics. At the same time, artists were asserting their creative freedom to produce innovative work and were gradually being recognized as legitimate. By the late nineteenth century, art galleries exhibiting and offering original works of art exclusively as fine art, rather than merely decorative items, were becoming well-established. Two important galleries that were established at this time, and continue to operate today, are Knoedler and Co. and Wildenstein and Co.^[22]

The rise of art dealers and their establishment of galleries marked a significant change in the development of a

new art market as they assumed the role of middleman. But art dealers gradually undertook a much more significant role than merely facilitating transactions. In this new capacity, gallery owners expanded their function in the art trade, becoming impresarios of the fine arts who represented artists, presented exhibitions, and built audiences. Alfred Stieglitz was one of the earliest art dealers of this type, opening his New York gallery in 1905. Other important galleries were started by Betty Parsons and Sidney Janis, both in the late 1940s, and Leo Castelli in 1957. (Today's prominent dealers include Arnold Glimcher and his PaceWildenstein gallery, Mary Boone, and Larry Gagosian.)^[22]

Much as theater producers sought new plays, art dealers sought to discover and premiere new artists, only selling art instead of tickets. Ultimately, they assumed the role of gatekeepers, deciding which art works to display, and which artists to promote, and became tastemakers, courting critics and favorable reviews, and cultivating collectors by advising them on what to buy. The gallery eventually developed as the primary outlet for an artist's work. While artists have periodically initiated alternatives to the dealer-artist relationship, e.g., nonprofit cooperative galleries run by artists, for the most part, artists need to be represented by a gallery, similar to actors having an agent, in order to regularly exhibit, promote, and sell their art. This relationship became firmly established with the fall of the Parisian art market after World War II and development of the contemporary avant-garde art movement in New York and its assumption as the art world capital.^[6]

Diversity in the Market

The transition of the support structure for the arts from one of patronage to a primarily market-based environment provided an opportunity for art dealers to facilitate the distribution of art. With this system established, the overall expansion of the United States in the second half of the twentieth century was set to easily accommodate a significant boom in the arts. As a growing population of professionally educated artists began producing more and more art, a commensurate number of entrepreneurial connoisseurs joined the gallery system as dealers to negotiate its distribution. And as the market expanded and segmented, with artists creating work in endless styles and media, art dealers differentiated their galleries from one another to meet equally diverse tastes.

According to the 1970 census, the number of individuals classified as professional artists ("Professional artists" refers to the census occupational classification of painters, sculptors, craft-artists, and artist printmakers. This is a distinct category from performing artists, authors, etc.) was 87,000.^[3] By 2000, this figure had increased to 231,000.^[23] The number of art galleries grew at an even faster rate. The 1982 US Economic Census reported 1563 establishments; just 10 years later 4543 galleries were

counted, and the 2002 report totaled 6328 galleries.^[11,24] These totals represent significant growth in the sector. In New York City alone, for example, there were approximately 150 galleries in 1946; by 1975 the total had increased to 761.^[3] By 2007, New York had more than 1000 commercial galleries.^[12]

Just as the entertainment business is often referred to as an industry, e.g., the film industry, the buying and selling of works of arts is a well-established commercial enterprise, with art dealers and their galleries playing a central role. This industry is part of the U.S. retail trade sector, is classified by the North American Industry Classification System as 453920-*Art Dealers*, and defined as "establishments primarily engaged in retailing original and limited edition art works. Included in this industry are establishments primarily engaged in displaying works of art for retail sale in art galleries."^[11] The category includes auction houses selling art, in addition to art dealers and art galleries selling art to retail customers. These are distinct from retail establishments selling reproduction art or art supplies, art galleries displaying art not for retail sale (e.g., museums and other similar arts organizations), or those selling art without a physical location (e.g., electronic home shopping or direct sales). The sector is responsible for generating annual sales in the United States of more than \$4 billion in 2002,^[11] up from \$3 billion in 1997, and \$2 billion in 1992,^[24] art galleries account for approximately 70% of this market,^[25] half of which is generated by galleries in New York, California, and Florida.^[24] Auction houses are responsible for the remaining 30% of sales in the sector.^[25] There are about 100 art auction houses in the United States,^[11,13] but the market is dominated by two international companies, United States-based Sotheby's and United Kingdom-based Christie's, who together account for approximately 80% of auction sales.^[25]

For economists, and others concerned with art as a commodity, the art market is broadly divided into the primary, secondary, and tertiary markets. The primary, or source, market refers to contemporary art works being sold for the first time, and this generally means the work of young, emerging artists, although unknown artists from previous generations whose work has never been sold are occasionally discovered. The secondary market deals in the resale of artworks, either the work of recognized artists who have built a following among collectors, or other established historical pieces. The sale of fine art by auction houses is classified as the tertiary market. Art dealers participate in this market when they buy and sell artwork at auction.^[26]

Similarly, art galleries can be segmented by the same market categories based upon the type of artwork for sale, i.e., emerging or established artists, or auctionable art. Given the quantity of art produced, the majority is only ever sold in the primary market, if it is sold at all. There is very little demand for most art beyond its initial purchase, since very few artists gain enough of a reputation to build a secondary market. Auction houses, particularly the large

international ones, are becoming increasingly selective about the art they accept on consignment for sale; therefore an artist's reputation and an artwork's provenance are increasingly important.

As with individual businesses in any commercial sector, galleries specialize in a number of different ways beyond these broad market categories, according to the types of art they handle and other factors. The art market and galleries can also be divided by artistic discipline, in art historical terms, or by category,^[26] in economic terms (e.g., paintings, prints, or photographs); by period and region, or sector, respectively (e.g., Italian Renaissance, Twentieth Century American, or Chinese Contemporary); by style and movement, or type (e.g., Impressionism, Modernism, or Pop Art); by genre (e.g., portraits, landscapes, or sporting); or by media (e.g., ceramics, film and video, or textiles). For example, one gallery might

concentrate on anything from the more general category of contemporary art by emerging artists, another in world folk art, while others might focus narrowly on American nineteenth century marine paintings, or black-and-white photography. The various concentrations are nearly endless. (See Table 1 for a listing of categories and sectors in the art and antiques market used by the two major international auction houses, Sotheby's and Christie's. These are closely aligned with gallery specializations.)

Galleries may also focus on a particular type of customer. The connoisseur and institutional collector was the clientele of choice for the galleries described earlier. However, galleries cater to many other types of art buyers as well. Some galleries may appeal to tourists by featuring themed art on local attractions, history, or culture, or by promoting only local artists (e.g., American Indian ceramics in Santa Fe, New Mexico, or plein-air paintings

Table 1 Structure of international art market by category and sector.

Discipline or category	Period and region or sector
Ancient and Ethnographic Arts	Aboriginal Art; African and Oceanic Art; American Indian Art; Antiquities; Islamic Art; Pre-Columbian Art
Asian Art	Chinese Ceramics and Works of Art; Chinese Classical and Modern Paintings; Chinese Contemporary Art; Indian and Southeast Asian Art; Japanese Art; Korean Art; Southeast Asian Paintings
Books and Manuscripts	Atlases, Maps, Natural History, and Travel; Continental Books and Manuscripts including Science; English Literature, History, Private Press, and Children's Books; Printed and Manuscript Music; Printed and Manuscripts Americana; Western Manuscripts; Medieval Illuminated Manuscripts
Ceramics and Glass:	English and Continental porcelain and pottery from the early eighteenth to nineteenth century; glass and paperweights from the fifteenth to the nineteenth centuries; and, Chinese export porcelain.
Collectibles and Memorabilia	Arms, Armor, and Militaria; Automobiles; Collectibles and Memorabilia; Sporting Guns
Fashion	Lace, costume, textiles, fans, needlework, quilts, and samplers dating from the sixteenth to the twentieth centuries, as well as haute couture from the 1920s onward.
Furniture and Decorative Arts:	Nineteenth Century Furniture, Sculpture, and Decorative Works of Art; Twentieth Century Decorative Arts and Design; American Furniture, Decorative Works of Art and Folk Art; Arcade: Furniture, Decorative Works of Art, and Carpets; Decorative Arts and Jewelry Department; English Furniture and Decorations; European Furniture; European Sculpture and Works of Art; French and Continental Furniture, Decorations and Tapestries; Garden Statuary and Architectural Items; General Furniture and Decorations; House Sales; Judaica; Rugs and Carpets
Jewelry	Modern and period jewels, signed and unsigned, precious stones, as well as jewelry from specific periods, styles, or jewelers.
Musical Instruments	Stringed, fretted, and wind, as well as early keyboard instruments
Paintings, Drawings, and Sculpture	Nineteenth Century European and British Paintings; Twentieth Century British Art; American Paintings, Drawings, and Sculpture; Australian Art; British Drawings, Watercolors, and Portrait Miniatures; British Paintings 1500–1850; Canadian Art; Contemporary Art; Fine Arts (the following collecting areas: Old Masters and Nineteenth Century European Art, Impressionist and Modern Art, American Paintings, Drawings, and Sculpture, and Contemporary Art); German and Austrian Art; Greek Paintings and Sculpture; Impressionist and Modern Art; Irish Art; Israeli and International Art; Latin American Art; Marine Paintings and Nautical Works of Art; Old Master Drawings; Old Master Paintings; Orientalist Paintings; Scandinavian Paintings; Scottish Art; Spanish Paintings; Sporting Art; Swiss Art; Victorian and Edwardian Art
Photographs	Photographs; Picture Library
Prints	Old Master, Modern, and Contemporary Prints
Silver, Russian, and Vertu	American Silver; English and European Silver and Vertu; Russian Paintings, Works of Art, Faberge, and Icons
Stamps, Coins, and Medals	Coins; Postage Stamps
Watches and Clocks	Clocks, Watches, Barometers, and Mechanical Music
Wine	Fine and Rare Wine

in Laguna Beach, California). Other galleries may cater to interior designers or corporate art curators, for example, by providing reasonably priced prints that might integrate easily in a home or office setting, or by offering professional discounts.

Art galleries often locate near one another in order to take advantage of a shared audience. Clusters of galleries may exist in specific neighborhoods that are designated as art districts, especially in large urban centers. New York has the highest number of galleries in the United States and several recognized art districts, such as SoHo, Chelsea, and 57th Street, and its galleries' influence continue to dominate the international art market. However, arts communities in other locations (e.g., Los Angeles, Chicago, San Francisco, Washington, D.C., and the metropolitan areas of Florida and Texas) have proliferated and grown in influence recently. Successful galleries also operate in smaller cities that have large populations of artists, or the so-called art colonies, which in turn attract art collectors (e.g., Santa Fe and Taos, New Mexico). Many small local markets throughout the country also support artists and galleries, albeit in proportionally fewer numbers, and with lesser influence in the wider national and international markets.^[3]

CONCLUSION

Private commercial art galleries have developed as the primary enterprise for distributing art to collectors and appreciators of art. The art market in general, and the market for museum-quality art in particular, has expanded quite measurably to become a not-insignificant part of the retail sector. The diversity and quantity of art being produced combined with increasing public participation in the arts has fostered an equal expansion of galleries to meet the supply and demand. Consequently, art dealers have worked to distinguish themselves in a number of ways, through specialization, market segmentation, and status in order to succeed.

The independence of art galleries as entrepreneurial businesses operating in a relatively unregulated marketplace, combined with no real alternative system for introducing and presenting new artists, enables art dealers to exercise significant control over what art is, and is not exhibited. This gatekeeping role is further stratified by a closed network that distinguishes and privileges elite galleries within the art world. This closed network, comprised of a fairly small group of dealers, collectors, curators, and auctioneers, enables a recurring number of conflicts of interest and ethical dilemmas, particularly among interactions with the public nonprofit side of the art world. Although these galleries represent a small percentage of the total number of establishments they are most often presented as the model art gallery and the focus of the majority of press and research on the international art market.

Most artists have maintained a love/hate relationship with art dealers and their galleries, and periodically organize for themselves alternative venues and systems for exhibiting and selling their art with limited success. The relationship is somewhat similar to that between musicians and record companies. The recent trend in that medium to self-produce and distribute may be an indication of new alternative approaches for artists to the art gallery.

Art Librarianship

Kathryn M. Wayne

Art History/Classics Library, University of California, Berkeley, California, U.S.A.

Abstract

Art librarianship is a profession that unites academic backgrounds in the visual arts, art history, architecture, and allied fields together with an advanced degree in library science and information management. The collections art librarians manage continue to be mostly comprised of print resources although technological advances, such as digitization of images and the creation of online databases and catalogs, have significantly impacted art research methodology. Art librarians work in several library settings such as academic, museum, public, and visual resources. Depending on the size and scope of the collection, responsibilities can include management, collection development, reference, bibliographic instruction, research, and cataloging. Art librarians work closely together through worldwide professional organizations, contribute to the literature through articles and book reviews, and write essential reference works and standards for the field.

HISTORICAL INTRODUCTION

Since the early twentieth century, art librarians have been building comprehensive collections in order to meet the needs of art historians, scholars, and curators in public, academic, and museum institutions, both large and small. Surprisingly, no one monograph exists that provides comprehensive descriptions of prominent libraries such as the National Art Library at the Victoria and Albert Museum in London, the Metropolitan Museum of Art's Libraries, Harvard's Fine Arts Library, the New York Public Library, the Canadian Centre for Architecture's Library in Montreal, to name a few. Sarah Scott Gibson traces the development of art librarianship and origins of art libraries in her article "The Past as Prologue: The Evolution of Art Librarianship."^[1] The article is part of an issue with the theme "The State of Art Librarianship." A seminal work on art librarianship that continues to be relevant is *The Art Library Manual: A Guide to Resources and Practice*.^[2] Edited by Philip Pacey, it covers all types of art libraries and resources housed, for example artists' books, photographs, exhibition catalogs, books, and periodicals. Pacey describes his other title, *A Reader in Art Librarianship*, as being

about how and why art librarianship has developed into a distinct branch of librarianship; about what it takes to be an effective art librarian; about how art librarians differ from other librarians; and about how and why art librarians have developed their own associations.^[3]

Another early work appeared in an issue of *Library Trends*,^[4] edited by Guy Marco and Wolfgang Freitag and entitled "Music and Fine Arts in the General Library." The contributors represent a "Who's Who" in art

librarianship in the mid-1970s. Two publications include *A History of Art Libraries in Canada*^[5] covering a chronological history of Canadian art libraries from 1632 to present and biographies of Canadian art librarians no longer living. *Art Museum Libraries and Librarianship*,^[6] edited by Joan Benedetti, provides a series of essays contributed by art librarians currently working in museums worldwide, with a bibliography covering additional sources on museum librarianship. Ann Abid's introduction provides a brief history of the major museum libraries in the United States, from the late 1800s to present.

Another way to identify art collections and their librarians, is through directories, both historical and current. Beginning in 1923, the *American Library Directory*^[7] was one of the first directories to record the existence of art libraries, included under the heading of "Special Libraries." Within this listing are some of the early American museum libraries such as the Cleveland Museum of Art Library, the Ryerson Library at the Art Institute of Chicago, and the Cincinnati Art Museum Library. It was not until the late 1960s and early 1970s that the first professional art librarian organizations were formed in Europe and North America: the Art Libraries Society (now ARLIS/UK and Ireland), the Art Libraries Society of North America (ARLIS/NA), and the International Federation of Library Association's (IFLA) Art Libraries Section. Each had the goal of creating specialized art directories that would provide researchers with a reference that described art library collections. After publishing three preliminary lists, the IFLA Section of Art Libraries published its *Directory of Art Libraries*^[8] under the direction of Jacqueline Viaux, the first chairwoman of the IFLA group which in 1977 was called the Round Table of Art Librarians. Its North American counterpart, *The Directory of Art Libraries and Visual Resource Collections in North*

America^[9] was compiled by Judith Hoffberg, the founder of ARLIS/NA. Today, the *International Directory of Art Libraries*^[10] provides almost 3000 listings to art, architecture, and archeology libraries and over 4000 art librarians worldwide. The print edition is complemented by an online directory of the same title.^[11] Histories of individual art library collections can also be found in the periodical literature, for example Susan Allen's "*Toward an International Art Library: The Growth of the Research Library at the Getty Research Institute 1979–2002*."^[12]

The role of the art librarian in the first half of the twentieth century was to serve the information needs of faculty, students, curators, collectors, and art professionals, and to focus on collecting, organizing, cataloging, maintaining, and preserving the largest collections with the greatest historical significance. At the same time, the modern art library began to proliferate in national libraries, museums, and academic institutions throughout Europe and the United States. Access to these library collections was provided onsite to users via a card catalog. Many of the prominent art libraries published catalogs of their holdings in printed format, such as Harvard University's Fine Arts Library^[13] and the Victoria and Albert Museum.^[14] Art librarians purchased these catalogs and, in turn, were able to provide their patrons with bibliographic access to some of the largest art library collections.

In the 1980s, art librarians focused on converting card catalog records into machine readable format and the first computerized local catalogs became available. The Internet now makes it possible to search holdings of almost all major art libraries worldwide, either by looking at an individual online public access catalog (OPAC), such as the *Getty Research Institute Research Library Catalog*^[15] or *Watsonline*, the catalog of the libraries of the Metropolitan Museum of Art.^[16] Over 9000 library catalogs worldwide can be searched via the Online Computer Library Center's *Worldcat*.^[17] The database *CAIRNS* (Cooperative Information Retrieval Network for Scotland)^[18] includes 52 library catalogs. *The European Library*^[19] online catalog provides bibliographic access to the holdings of 47 national libraries across Europe, including access to online books and images. There are still many art libraries in the United States and Europe that have not completely converted all of their card catalog records into their OPACs and others have created databases that are not accessible via the Internet.

TWENTY-FIRST CENTURY TRENDS

The new millennium has brought changes to art librarianship through continuing technological advancements. One of the most significant trends is the digitization of analog image and slide collections. Paula Hardin provides a model for implementing this new technology in her chapter *Integrating the Digitization of Visual Resources into Library*

Operations.^[20] Another area that has been impacted by digitization is special collections material. Various rare collections from art libraries all over the world are being scanned and text and images will become available for those resources through finding aids. Historical maps, architectural drawings, manuscripts, and rare books are examples of formats that lend themselves well to the two-dimensional scanning process. The Institute of Museum and Library Services' *IMLS Digital Collections Registry* is currently funding the digitization of archives in several museums and libraries.^[21] The third area that has received much attention is the mass book digitization projects supported by Google, Microsoft, and Yahoo begun in 2006 through partnerships with over 27 libraries. Books in all disciplines published prior to 1923 and considered to be in the public domain, are being scanned and their full text, along with illustrations, is becoming accessible to the public.

One of the major differences between arts and humanities users versus those in social sciences and science disciplines is their preference for high-quality color reproductions in beautifully published books, often oversized. Today's art historians and curators still deem the printed book the most desirable format. Even when a special collection is available digitally, many scholars will travel to the library to examine the original object, the paper, the ink, and the binding; a similar process to that of viewing an original work of art. One study, *Art History and its Publications in the Electronic Age*,^[22] discusses the state of scholarly publishing for the discipline of art history.

Despite the overall increase in digitized resources, today's art librarians are still collecting primarily print-based collections. Only a small percentage of art journals are being published electronically in full-text format. *JSTOR: the Scholarly Journal Archive*^[23] is a database for archiving academic journals. It includes full text for approximately 64 art and art history-related journals, excluding the last 5 years. Major print-based art periodical indexes such as the *Bibliography of the History of Art*,^[24] *Art Full Text* and *Art Index Retrospective*,^[25] *ARTbibliographies Modern*,^[26] and the *Avery Index to Architectural Periodicals*^[27] are now available as Web-based searchable databases. *Oxford Art Online*^[28] includes *Grove Art Online*, the only scholarly art encyclopedia available online with full text and images. After many years of development, the Mellon Foundation has published *ARTstor*,^[29] the largest digital image database available complementing academic art and architecture teaching and scholarship. The *Imageline* project is a proposal "to assess the feasibility of establishing an international web gateway providing access to sources of images."^[30]

EDUCATIONAL REQUIREMENTS

Professional art librarian positions require an accredited master's degree in library science (M.L.S.) or library and

information science (M.L.I.S.). In the United States, there are numerous American Library Association-accredited library degree programs but currently only three that grant a dual master's in library science and art history: Pratt School of Information and Library Science in New York City; the School of Library and Information Science, Indiana University; and the University of North Carolina Chapel Hill School of Information and Library Science. In the United Kingdom, the Chartered Institute of Library and Information Professionals^[31] accredits undergraduate and postgraduate library and information courses in England, Wales, and Scotland. Many librarians obtain a master's degree in library science after completing either an undergraduate or graduate degree in studio art, art history, architecture, or allied discipline.

The publication *Core Competencies & Core Curricula for the Art Library and Visual Resources Professions* "identifies the fundamental knowledge, behaviors, and skills currently essential to most professional positions within the art information field."^[32] The document *Criteria for the Hiring and Retention of Visual Resources Professionals* provides standards for visual resources positions.^[33] Position listings for art librarians can be found through professional organizations' listservs as well as periodicals such as *Library Journal* and the *Chronicle of Higher Education*.

ART LIBRARY SETTINGS

With an accredited library degree, a professional librarian interested in pursuing a career in an art library has a variety of settings from which to choose: academic (art, architecture, art, and design school), museum, public, and visual resources. The size and staffing of libraries in all of these settings can vary greatly, from a small one-person library to a large internationally prominent collection with numerous staff.

Academic

Academic art libraries can cover one or more of the fine arts disciplines. Art history, architecture, landscape architecture, archaeology, urban design and planning, and studio art curriculums often serve undergraduates and graduate students, both masters and Ph.D.s. The focus of an academic art and architecture collection is generally on history and theory while studio art and design collections may be broader in scope and include practical manuals on drawing, painting, etc. Fine arts libraries are typically housed in a separate facility and are commonly referred to as branch or subject specialty libraries. At some universities, these collections may be integrated into a main library complex. Although collections can vary from large (150,000 + volumes) to very small (10,000 + volumes), the types of resources most often collected include print

and online reference sources, databases, periodical indexes, books, periodicals, exhibition catalogs, catalogue raisonnés, visual resources such as print reproductions, slides and digital image databases, and media (CDs, DVDs, video). Collections of local theses and dissertations may also be housed. Special collections in the art library can include unique archival and primary source material such as artists' books, ephemera, and artists' papers. Microform sets such as the Courtauld Institute of Art's *Conway Library* or the *Museum of Modern Art Artists Files* provide access to unique archival material. Comprehensive academic art collections house resources published in all languages with an emphasis on Western European languages.

No published ranking of academic art libraries exists; however, the Association of Research Libraries provides rankings and statistics for the top academic libraries in the United States.^[34] The accreditation bodies and requirements for the accrediting process related to academic art libraries are described in detail in *The Library and the Accreditation Process in Design Disciplines: Best Practices*.^[35]

Museum

In the museum library setting, art librarians primarily serve the needs of museum curators and the institution's exhibition and educational outreach programs. Museum library collections usually include books, periodicals, exhibition catalogs, catalogue raisonnés, reference sources, periodical indexes, and sales catalogs from auction houses such as Christie's and Sotheby's. Subscriptions to online auction catalog databases are also integral to the museum library. Special collections often include primary sources such as artists' books, artists' files, artists' archives, and oral histories, along with the museum's historical correspondence and administrative archives. These collections are focused on the interests of the museum's art collections by period, e.g., Museum of Modern Art and/or cultural emphasis, e.g., Asian Art Museum of San Francisco. The publication *Art Museum Libraries and Librarianship*^[6] provides a current overview of this field. (See also the entry Art Museum Librarians in the second edition of the *Encyclopedia of Library and Information Science*.) In the United States, museums go through an accreditation process sponsored by the American Association of Museums and the museum library participates in this review.

Public

Many public libraries support art collections that might complement a strong local community interest in the arts. These collections tend to include popular art books and magazines, how-to guides for artists, along with access to one or more of the major online art periodical

indexes. Public art librarians serve patrons with little or no initiation to the field, or with a general interest in art, along with researchers and professionals, such as architects who may not have a college or university library available in the area. Although most public art librarians do not have the funding to build extensive collections, some of the public libraries established in the late nineteenth or early twentieth century, such as the New York Public Library and the British Library, house comprehensive research-level art collections similar to those found in academic libraries. Heather Rowland's chapter in the book *Information Sources in Art, Art History and Design*,^[36] provides a history of art resources in public libraries in the United Kingdom along with current trends in collection management and reference sources.

Visual Resources

Visual resource curators manage pictorial material such as slides, digital images, and prints (reproductions and photographs). These collections are often found in the art library settings described above, and in university or art school settings can be large, stand-alone operations that report directly to an academic department rather than the institution's library. Collections are often comprised of images photographed or scanned in-house from books and journals, purchased image collections, and gifts. Curators are responsible for cataloging these collections with many professionals choosing to follow national standards by using the *VRA Core*^[37] and the Getty Research Institute's Getty Vocabulary Program databases^[38] such as the *Art and Architecture Thesaurus*, *Union List of Artist Names* and the *Getty Thesaurus of Geographic Names*. For additional information see the entries "Visual Resources Association (VRA)," p. 5572, and "Visual Resources Management, in Cultural Institutions," p. 5578, in this edition of the *Encyclopedia of Library and Information Sciences*.

PROFESSIONAL RESPONSIBILITIES

Depending upon the scope of the position, size of library and setting, art librarians can be responsible for one or all of the following areas: collection development, reference, bibliographic instruction and research, cataloging, and management of staff, budget, and library facilities.

Collection Development

One of the most important roles the art librarian fulfills is determining which resources should be added or deleted from the collection. A collection development policy can provide an overview of the scope of collections such as areas, period and languages covered, collecting level, and

types of materials collected. The publication *Collection Development Policies: for Libraries & Visual Collections in the Arts*^[39] provides art librarians with examples of collection development policies along with guidelines for writing a policy.

Both historical and recently published art bibliographies are helpful tools for building core reference and monograph collections. One title, *Guide to the Literature of Art History 2*^[40] complements an earlier edition, *Guide to the Literature of Art History*,^[41] providing the most comprehensive art bibliography published. The titles *Fine Arts: A Bibliographic Guide to Basic Reference Works, Histories, and Handbooks*^[42] and *Art Books: A Basic Bibliography of Monographs on Artists*^[43] provide a core list of important art books and catalogue raisonnés for well-known artists.

Book review publications that focus on art resources include *The Art Book: Issues, News and Reviews*,^[44] *Bookforum: The Book Review for Art and Culture*,^[45] the College Art Association's *CAA Reviews*^[46] and *ARLIS/NA Reviews*.^[47] The *Art Libraries Journal (ALJ)*^[48] provides reviews of books about, or relevant to, art librarianship, such as major art-related bibliographies and reference works. Other library journals such as the Association of College and Research Library's *Choice Magazine*^[49] provide reviews for all disciplines including the fine arts.

Art librarians may opt to use art-based approval plans to obtain recently published museum and gallery exhibition catalogs along with trade and university press titles. Books are shipped automatically or selected title-by-title following pre-determined parameters that are based on the library's collection development policy. Art approval plans are available from several vendors located in the United States and Europe. Some of the most widely known vendors that supply European imprints include Erasmus Boekhandel,^[50] Casalini Libri,^[51] Touzot,^[52] and Harrassowitz.^[53] Worldwide Books^[54] provides international coverage of exhibition catalogs as well as current trade publications. Two approval vendors that cover titles published in the United States and United Kingdom include Yankee Book Peddler^[55] and Blackwell.^[56] Art librarians with limited budgets might prefer to place orders directly to publishers of interest. Titles can be ordered through *Amazon.com* along with European counterparts such as *Amazon.co.uk* (United Kingdom), *Amazon.fr* (France), *Amazon.de* (Germany), *Bol.it* (Italy), and *FNAC.com* (Spain).

Art books, especially exhibition catalogs, are generally published in small runs, and can quickly go out-of-print. A list of art-related antiquarian and out-of-print art book dealers worldwide can be found by searching the International League of Antiquarian Booksellers' Web page.^[57] Online ecommerce search engines such as *Bookfinder*, *Abebooks*, and *AddAll* provide extensive lists of new, used, rare, and out-of-print art books linking to individual booksellers worldwide.

Reference, Bibliographic Instruction, and Research

Art librarians serve primary clientele, local art professionals, and the general public with questions related to myriad art topics. The increase of online art resources combined with the continued publication of printed resources, has made the research process more complex for patrons to locate, navigate, and evaluate relevant publications which in turn has expanded the art librarians' role in both reference service and bibliographic instruction. Reference "points" for most art librarians can include a reference desk with scheduled hours, online chat, email, telephone, or by appointment.

Bibliographic instruction can include tours, general library orientations, in-class research seminars on a particular subject, or locally published research guides that might describe one source comprehensively or provide annotated bibliographies for an art-related topic. The guide, *Library Instruction for Students in Design Disciplines*,^[58] provides descriptions of a variety of art-related courses taught by art librarians in academic institutions throughout the United States.

Art librarians also create library Web sites providing links to important art resources available, both licensed and free. Blogs, or Web logs of text that might describe recent acquisitions or new trends, often are included as well. In addition, art librarians are beginning to utilize Google's *You Tube* as another means to promote research to their users—for example the tutorials created by librarians and faculty at Otis College of Art and Design.^[59] Librarians are also utilizing social networking destinations such as *MySpace*, *Facebook* and *Twitter* to reach their audiences.

Art librarians are responsible for original research and publication and continue to be the major contributors to the art library journal literature, primarily *Art Documentation* and the *Art Libraries Journal*. Article content can be searched using the periodical index *Library Literature*. Combined, these two journals, along with newsletters published by the Art Libraries Society and other art library organizations, provide a comprehensive history of the field of art librarianship.

Cataloging

The cataloging of all types of art materials requires subject background and coursework based on the *Anglo-American Cataloguing Rules* (AACR2)^[60] and *MARC21 Concise Format for Bibliographic Data*.^[61] One-person art libraries, museum libraries, and visual resources collections usually catalog their own collections onsite, where academic institutions generally catalog books in a central cataloging unit housed within the technical services department. In the academic setting, art catalogers might cover the fine arts as well as additional humanities

disciplines, such as theater, dance, and music. Art catalogers communicate across institutions and through professional organizations such as the Visual Resources Association (VRA) and the ARLIS/NA Cataloging Section^[62] about current cataloging trends and art-related issues. The *Cataloguer's Toolbox*^[63] created by Memorial University, Newfoundland, provides a variety of international cataloging resources.

Management

The head of the art library is responsible for numerous administrative activities such as hiring, training, supervising and evaluating staff (professional, paraprofessional, students, interns, and volunteers), long-range planning, annual reports, statistics, and budgets.

The management of facilities is an area requiring increased attention, as print collections often outgrow available stack space. Art librarians must carefully determine whether to withdraw or store materials off-site if that option is available. Security is another critical issue as a result of the increased value of rare art books and special collections.

Six art library facilities appear in a special issue of *Art Libraries Journal*.^[64] Two examples of art libraries designed for the twenty-first century are the Fleet Library at the Rhode Island School of Design (Fig. 1) and the

Fig. 1 Interior, Fleet Library, Rhode Island School of Design, Office dA.

Docklands Campus Library and Business School at the University of East London (Fig. 2). The key to a successful art library project is the articulate communication of needs from the art librarian to the architect during the programming phase. The handbook *Planning Academic and Research Library Buildings*^[65] is a key reference along with *Facilities Standards for Art Libraries and Visual Resources*^[66] (currently under revision) and IFLA's *Libraries as Places: Buildings for the Twenty-first Century*.^[67] Macken's article, *The Art Library as Place*, examines "the impact of changing technology on the physical space of the academic art library and the relevance of current trends in space planning to the art library of the future."^[68]

PROFESSIONAL ORGANIZATIONS

There are several organizations that support the field of art librarianship. Art librarians often participate in a variety of professional organizations and affinity groups depending upon their specialty.

ARLIS/UK and Ireland

The Art Libraries Society United Kingdom and Ireland (ARLIS/UK and Ireland)^[69] was founded in 1969 to promote all aspects of the librarianship of the visual arts, including architecture and design. Approximately 350 members work in academic settings, museum libraries, and public libraries, and include booksellers, publishers,

and professional practice libraries. Publications include a scholarly quarterly journal *Art Libraries Journal*, and a bi-monthly newsletter *ARLIS News-Sheet* providing news, bibliographic information, and scholarship for art librarians internationally. An annual conference is held at a university location in the United Kingdom or Ireland. Members can communicate via *ARLIS-LINK*,^[70] its online discussion listserv.

ARLIS/NA

The Art Libraries Society of North America (ARLIS/NA)^[71] is the primary professional association for art librarians in the United States, Canada, and Mexico. Inspired by ARLIS/UK and Ireland, it was founded by Judith Hoffberg and nine other charter members in 1972.^[72] The stated mission in the ARLIS/NA Strategic Plan 2006–2009 is "to foster excellence in art and design librarianship and image management."^[73] Its 1000 members include art and architecture librarians working in art libraries and visual resources collections as well as students, book publishers, dealers, and gallery owners. Members can participate on a local level by joining one of the Society's chapters. An annual conference includes workshops, tours, and juried sessions that respond to a programmatic theme. Publications include a journal, *Art Documentation*, an *Occasional Papers* series and *Bibliographic Notes*, an online column that includes recent articles and books covering topics devoted to art librarians and art librarianship. ARLIS/NA hosts an open, moderated listserv, *ARLIS-L*.^[74]

ART LIBRARIES SOCIETIES WORLDWIDE

- ARLIS/ANZ (Australia and New Zealand): <http://arlisanz.anu.edu.au/>.
 ARLIS/NL (Netherlands) – Overleg Kunsthistorische Bibliotheken Nederland: <http://www.okbn.nl/>.
 ARLIS Norden (Scandinavia): <http://www.arlis.org.uk/link/link.html>.
 ARLIS Flanders/Belgium: <http://www.vvbad.be/okbv/engels>.

VRA

The Visual Resources Association: The International Association of Image Media Professionals (VRA)^[75] grew out of a long history of involvement with other art-related organizations, the College Art Association (CAA), the Art Libraries Society of North America (ARLIS/NA), and the Mid-America College Art Association (MACAA). The VRA was formally established in 1982 and has over 800 members. The purpose of the VRA is to support and educate image professionals on the creation, description, and distribution of both analog and digital images, primarily for art- and architecture-related collections and to develop standards for the profession. The association also has regional chapters. The *VRA Bulletin* is the association's quarterly journal featuring conference reports and scholarly articles. *Images Newsletter* is published bi-monthly as an electronic journal and contains member and organization-related news. The *VRA Special Bulletins* are occasional publications covering current trends and topics of interest to the profession. The *VRA-L* online discussion list is open to members only.

IFLA

Although the International Federation of Library Associations and Institutions (IFLA) was formed in 1927, its Art Libraries Section evolved in 1982 through the efforts of French art librarian Jacqueline Viaux.^[76] The Section "endeavors to represent libraries and organizations concerned with all formats of textual and visual documentation for the visual arts, including fine arts, applied arts, design, and architecture."^[77] J. Margaret Shaw's article^[78] provides an account of the Art Libraries Section's 25-year history, including its officers, and a list of its publications and projects. A strategic plan^[79] outlines its mission and goals. The Art Libraries Section meets annually at the IFLA World Library and Information Congress. Serial publications include the *International Directory of Art Libraries* and the electronic journal, *IFLA Art Libraries Section Newsletter*. The IFLA Publication series covers numerous topics on librarianship, some focused on art librarianship, e.g., *Multilingual Glossary for Art Librarians*.^[80] An online discussion list, *IFLAART*, is a closed, moderated list, with approximately 250 subscribers.

ADDITIONAL ART-RELATED LIBRARY AND AFFINITY ORGANIZATIONS

American Association of Museums (AAM): <http://www.aam-us.org/>.

Established in 1906, AAM has developed standards and best practices, promoted gathering and sharing of knowledge, and provided advocacy on issues of concern to the entire museum community. Every type of museum is represented, including art.

American Library Association (ALA), Association of College and Research Libraries (ACRL), Arts Section: <http://www.ala.org/ala/acrl/aboutacrl/acrlsections/arts/arts.cfm>.

A section of ACRL, a division of ALA, which provides an umbrella organization for librarians and specialists working in or interested in the fields of visual and performing arts.

Arbeitsgemeinschaft der Kunst- und Museumsbibliotheken (AKMB) (Germany): <http://www.akmb.de/>.

The Association of Art and Museum Libraries supports education, training, and cooperation for art librarians working in Germany. Affiliated with ARLIS/NA.

Association of Architecture School Librarians (AASL): <http://www.architecturelibrarians.org/>.

Established in 1979 at the annual meeting of the Association of Collegiate Schools of Architecture, AASL's goal is to enhance various aspects of academic architectural librarianship. Affiliated with ARLIS/NA.

Association des Bibliothécaires de France (ABF): <http://www.abf.asso.fr/>.

Founded in 1906 and recognized as a public utility in 1969, ABF is the oldest library association in France. The Groupe des Bibliothèques d'art is one of its several working groups. Affiliated with ARLIS/NA.

College Art Association (CAA): <http://www.collegeart.org/>.

Founded in 1911, CAA's members are committed to the practice of art, teaching, and research. Affiliated with ARLIS/NA.

Japan Art Documentation Society (JADS): <http://www.soc.nii.ac.jp/jads/eng/index.html>.

Founded in 1989, with the object of promoting the development of art documentation, members include librarians, curators, art history students, media representatives, and computer specialists. Affiliated with ARLIS/NA.

Kunstfaggrupper (Denmark): <http://grupper.bf.dk/kunst/>.

Organization dedicated to all aspects of art librarianship, including education and training.

Museum Computer Network (MCN): <http://www.mcn.edu/>.

Affiliated with ARLIS/NA. See the entry "Museum Computer Network (MCN)," p. 3711, in this edition of the *Encyclopedia of Library and Information Sciences*.

Museum Documentation Association (MDA) (U.K.): <http://www.mda.org.uk/>.

Organization devoted to working with professionals in museums, libraries, and archives to promote best practices, accreditation guidelines, standards, and training.

Redarte-SP (Sao Paulo, Brazil): <http://www.goethe.de/ins/br/sap/prj/red/ptindex.htm>.

Network of information services related to art that brings together professionals who work in libraries, museums, and archives. The group develops projects that promote the broad dissemination of art information within the city of Sao Paulo.

Society of American Archivists (SAA): <http://www.archivists.org/>.

Founded in 1936, SAA is North America's oldest and largest national archival professional association which provides leadership to ensure the identification, preservation, and use of records of historical value. Affiliated with ARLIS/NA.

Society of Architectural Historians (SAH): <http://www.sah.org/>.

International organization that promotes the study and preservation of the built environment worldwide. Affiliated with ARLIS/NA.

Special Libraries Association (SLA), Museums, Arts, and Humanities Division: <http://units.sla.org/division/dmah/>.

Vitruvio: <http://www.vitruvio.cpaupage.com/>.

Organization for architecture, art, design, and urbanism librarians working in academic settings in Argentina and Latin America.

Established in 1929, the Division includes librarians and information specialists from all types of museums from historical societies, institutions, and other organizations having special departments or special collections devoted to the arts, decorative and performing arts, architecture, and humanities.

CONCLUSION

Over the past two centuries, art librarians have played a major role in building art libraries that support the world's finest academic and public institutions. The role of the art librarian will continue to expand as technological advances improve and affect the way resources are published, delivered, and received in the arts and humanities. The art librarian of the future will need to respond to the technological needs of future generations and at the same time give consideration to the preservation of rare, out-of-print materials. Some efforts, such as the Institut National d'Histoire de l'art in Paris,^[81] that combine several important art libraries into one facility, may be a trend for future collaborations worldwide. Perhaps the words Pacey wrote in 1985 still hold true,

Now as never before the collective power of art librarians must be exercised, on the one hand to safeguard what has been achieved hitherto, on the other to seek and to share

new solutions to old problems, and at all times to exercise art library power for the benefit of civilization.^[82]

Art Museums

David Gordon

Milwaukee Art Museum, Milwaukee, Wisconsin, U.S.A.

Abstract

The urge to collect things of beauty and significance goes deep into history. Art museums safeguard art for future generations. Works of art have power, and that power has been coopted throughout history by those who wish to assert authority, position, and wealth. The evolution of the display of art for the public reflects social, economic, and political developments, and can best be understood historically. This entry traces that history from ancient times on to the Renaissance, the Enlightenment, and the nineteenth century and on to modern times. Art museums provide an opportunity for civic pride, and for an architectural statement. The past three decades have seen a boom in new museum building. They are popular gathering places, and in catering (literally) for their growing audiences with cafés, special events, functions, and stores, they have to keep a proper balance between commercial activities and their core mission. Good governance is essential. Success should be measured in ways other than just by number of visitors. Temporary exhibitions should be worthwhile and not just crowd-pleasers. An issue of concern in collection management is ensuring that works of art have not been looted or expropriated. The popularity of art museums in a digital age is likely to continue as screen captives escape to look at real objects.

INTRODUCTION

An art museum is an institution that collects, preserves, and presents art for the public run by a professional staff driven by a mission to encourage a love and appreciation of art and working according to considered standards and procedures. While other museums show objects to explain, art museums show objects to inspire, nourish, and transport: explanation is an aid rather than the point. The spiritual aspect of art museums, and their often imposing buildings, gives them a kind of standing as secular cathedrals. As such they define the values, aspirations, and civilization of their cities, communities, and countries.

Not all art museums have “museum” in their title; sometimes they are called “gallery” or “institute” or “collection.” Art museums come in all sorts of sizes and can be categorized in different ways. In the United States there are over 4000 of them, mostly small, with around 200 of the leading ones with budgets of over \$2 million qualifying their directors for membership in the Association of Art Museum Directors (AAMD). A few art museums are encyclopedic, covering wide swathes of visual culture in depth. Some are general, with several substantial collections. Many specialize in, for example, sculpture, portraits, photography, textiles, decorative arts, Asian art, arts and crafts, and regional art; or in one artist. There are museums that are completely or predominantly the collection of one collector. There are museums that are parts of universities or other institutions. Most museums collect, but some simply mount exhibitions: the German word *Kunsthalle* (literally art hall) is apt but does not have an

English equivalent. One thinks of a museum as a building, but there are also open-air sculpture parks. Museums that are not art museums but historical or ethnographic or house museums have art works and objects in them, but in order to tell a story or provide context rather than to focus on aesthetics. Museums can also be classified by ownership: government, municipality, trustee, private individual.

Art museums with their cafés and stores are visitor attractions in the exploding area of cultural tourism. Some have become icons of economic regeneration and urban renaissance. Architecturally ambitious new museums and new additions have been springing up all over the world. As they have become larger, more complicated and more expensive to run, museums have confronted issues surrounding their collecting policies, focus, governance and management, and the potentially competing claims of increasing admissions and deepening scholarship. As not-for-profit organizations, relying increasingly on donations, they need to retain the high measure of public trust that has been reposed in them.

Museums can best be understood in a historical context. The word stems from the Greek word *mouseion*, meaning “temple of the Muses.” The range of what is considered collectible art has widened over time, usually following controversy about what is in the canon. The history of the art museum and its antecedents mirrors the history of culture. It illustrates the urge to collect things of beauty, significance, and interest made by imaginative and skillful humans; to use objects to seek affinity with other beings, human or supernatural; to share them with other

connoisseurs and people of taste; to demonstrate the “superiority” of western culture against the mere artifacts of native peoples—and latterly to celebrate those artifacts as works of art in their own right and manifesting a culture equal to that of the West; to show off works of art as evidence of wealth; and to make them available to the general public as part of a mission to improve, set standards and educate that public.

HISTORY

There has been considerable debate about whether the history of museums is linear and evolutionary or discontinuous. In the preface to the book they edited, Impey and Macgregor^[1] state:

With due allowance for the passage of years, no difficulty will be found in recognizing that, in terms of function, *little has changed*; along with libraries, botanical and zoological gardens, and research laboratories, museums are still in the business of “keeping and sorting” the products of Man and Nature and in promoting understanding of their significance.

The emphasis was added by Berelowitz,^[2] who takes a contrary view, influenced by Michel Foucault, that each period should be considered within its world view; there are huge disjunctions between them; and historians should avoid the temptation of presenting a story of continuous betterment from primitive to civilized. The brief account of the history of museums that follows takes a middle view: some things have remained constant, like keeping and sorting, but the meaning and context in which this has taken place has varied enormously.

Museums in Antiquity

While there is archaeological evidence of ancient peoples collecting things without obvious practical use, it was in the Hellenistic period that a taste for art and for the collecting of art developed. Greek temples, or *mouseions*, were dedicated to the various Muses of the arts and sciences. Votive offerings, often war booty, were stored in *thesauroi*, or treasuries, and were a visible display of power and influence. The temples became places of learning as well as offering. Whereas Plato’s lyceum taught through argument and induction, Aristotle’s drew deductions from an observation of things that were collected and categorized and stored. The lyceum needed a *mouseion*. Ptolemy I Soter (ca. 367–283 B.C.E.) incorporated objects as well as texts in his great library of Alexandria.

In 212 B.C.E., General Marcus Claudius Marcellus brought back treasures from Syracuse and the Romans discovered the wonders of Greek art and became avid collectors. Generals put their booty on display to the

public to demonstrate their successes and as a show of power. The collecting habit spread to the rich. Roman artists copied Greek originals and adopted their style, increasing supply. The statesman and General Marcus Agrippa (63 BC–12 BC) urged that statues and pictures should be viewable by the public instead of being stashed away in villas. “This was the first explicit declaration of the value of an art collection as a cultural heritage and of the right of the public to share in its enjoyment.”^[3]

Christianity understood the iconic power of art and attacked pagan art. Many ancient collections were destroyed, although in the Eastern Empire Constantine brought antique statues to his new capital.

Art Museums in the Middle Ages

In the Middle Ages churches were also museums—the only places where the public could see art. Art was no longer votive, or to celebrate victory in battle, or to flaunt individual wealth, but primarily devotional. Cathedral workshops and monasteries became centers of artistic production and recipients of gifts. Soaring Gothic arches and the glitter of gold objects emphasized to worshippers where authority resided. As society developed under the influence of trade and prosperity, courts and the bourgeoisie started collecting as well as the church, and works of art again became appreciated for themselves rather than for their symbolic value; artists gradually began to be valued as creators and not just artisans.

Art Museums in the Renaissance

Fittingly it was in Florence, heart of the Renaissance, the explosion of creativity in literature, sculpture, painting and architecture, and during its “High” phase in the sixteenth century, that the first art museum was constructed. Known as the *Uffizi* because state offices were on the ground floor, the palace was designed in 1560 by Giorgio Vasari (1511–1574) with the second floor *galleria* (hence probably “gallery” as a place for a collection of paintings) purpose-built for the display of art. The Medici installed their art collection and it was opened to the public (at first by appointment only) in 1591. Vasari, the first art historian and author of the *Lives of the Artists*, stressed the importance of the antique as an inspiration to modern artists and gave credit to the idea of genius and to historical development. He was a founder of the first official academy of art, the Accademia del Disegno, incorporated in 1563. While in the modern age art is associated with museums, art of a level rarely exceeded since had already been on public display in the form of Ghiberti’s bronze doors in the Florence baptistery (completed in 1452), Brunelleschi’s dome for the cathedral (1436), and Michelangelo’s *David*, put on display to widespread awe in 1504. Renaissance man witnessed the “rebirth” in the streets.

Art Museums in the Enlightenment

How did the idea of a place of contemplation and study open to the public develop? From several roots.

Art museums developed originally from what we would now classify more as science museums. Private collections of objects from the natural world, science collections, antiquities, manuscripts, and books put together in a spirit of inquisitiveness, go back to the Middle Ages, but spread from the Renaissance onward. Various known as *Wunderkammer*, or as “cabinets of curiosity,” they were open not to the general public but to like-minded seekers of a universal pattern in what to today’s eyes would seem a jumble. In 1683 Elias Ashmole presented his collection to the University of Oxford and the Ashmolean Museum became the first private collection to enter the public domain. The “use of the term “Museum” was a novelty in English: a few years later the *New World of Words*” (1706) defined it as a Study, or Library; also a College, or Publick Place for the Resort of Learned Men.”^[4] The physician, naturalist, and collector Sir Hans Sloane (1660–1753) bequeathed his large collection to the nation and the British Museum was created by Act of Parliament in 1753. It was a new type of institution in that it was governed by a body of trustees responsible to Parliament; its collections belonged to the nation, with free admission for all. Entry was given to “all studious and curious Persons,” linking public enjoyment with education.^[5]

Art museums also developed from the spread of art collecting around Europe in the seventeenth and eighteenth centuries. Art dealers and auction houses sprang up. Rome was the artistic capital of Europe until the Popes decided that art was too much of a distraction, and collections moved elsewhere. Rubens advised Duke Vincenzo I Gonzaga of Mantua about collecting. After the Duke’s death a large part of his collection was sold in 1627 to Charles I of England, an avid collector. The Spanish collected the more Catholic art of Flanders, and Philip IV sent Velázquez to Italy in 1649 to buy Italian art. The Dutch collected from around Europe as well as their home-grown artists enjoying a golden age. The French saw collecting as an expression of royal authority. The British nobility returned from their Grand Tours laden with art and artifacts to fill their country houses. Lord Burlington brought back the drawings of Palladio and changed the style of architecture of those houses. Art emerged from the cabinet into the long gallery, was arranged, and labeled.

Third, with the Enlightenment came the establishment of art academies (after Florence’s, came France in 1648, Venice in 1750, and London in 1768), with their collections to inspire and teach students, and their exhibitions. The annual shows of works by Academicians at the Royal Academy of Arts were selling exhibitions open to the public for a fee and were hugely popular. Appreciation of

art became more widespread. Collectors who did not want their collections broken up gave to the growing number of art and archaeology academies.

A fourth factor in the development of art museums was egalitarianism. While several art collections were opened to the public voluntarily by rulers (the Gemäldegalerie in Kassel by William VIII of Hesse in 1760, the Schloss Belvedere gallery in Vienna by Joseph II ca. 1781) it was the French Revolution that decisively put art into the public domain. With the fall of Louis XVI on August 10, 1792, the royal collection was declared the property of the nation, and the National Assembly moved fast to assemble choice works from the royal and church collections together in the Louvre, where Louis had been constructing a Grand Gallery until the Revolution broke out in 1789. The Louvre was also home to the Academy. A year later, to celebrate the anniversary, the Louvre was opened as part of a Festival of National Unity, and those who visited the Museum “would have come away with a . . . sense of Revolutionary triumph over despotism.”^[6] The Museum was for education; it was also for propaganda. The two were linked. The Academy’s master-pupil relationship was deemed elitist and it was crushed. The eclectic display of 1793 was deemed to hark back to the *Ancien Régime* and was replaced by 1801 by the more rational, enlightened arrangement by school and period. What mattered was that the “Louvre contained the greatest collection of Western art ever assembled under one roof, and nothing was to prevent that fact from being self-evident to the beholder.”^[6] In the same year the government decreed the establishment of 15 other museums around France.

Art Museums in the Nineteenth Century

The nineteenth century saw a boom in museum building in Europe and later in the United States. Monarchs wanted to appear more democratic by opening up their collections to the public. Nation-states and cities within them emphasized their power and prestige by establishing important collections in impressive buildings. The rising middle classes wanted to enjoy the polite arts as well as the useful arts of manufacturing and transportation. Educational reformers wanted to improve the lot of the working classes and saw art as a civilizing influence.

At the beginning of the century Napoleon brought vast quantities of art back from his conquests for the Louvre (renamed Musée Napoléon) and the provincial museums, but he also established museums in the lands that he conquered, for example, the Galleria dell’Accademia in 1807 in Venice as part of the art school established 17 years earlier, and the Museo del Prado in 1809. After his defeat in 1815, the art was seized back. In Berlin the returned art was put on display by Frederick William III, King of Prussia, who called for a national museum, the Altes Museum, possibly inspired by visits to the Louvre during

the peace negotiations. Karl Friedrich Schinkel, professor of architecture and Berlin's city planner, designed the purpose-built museum and worked with an art historian, Gustav Friedrich Waagen, on the display of only original works of art and only of masterpieces. They argued that the state's provision of aesthetic reverence would promote social unity and defuse the fervor for dissent. The Altes Museum opened in 1830.

Royal collections were in one way or another opened up in most of Europe. Not so in Britain. For one thing, the magnificent collection of Charles I had been auctioned off by Oliver Cromwell in 1649 to no popular protest other than about the poor prices realized. Subsequent monarchs, particularly George III, rebuilt it to some extent but had no intention of letting the public have access. In 1777 John Wilkes, a member of Parliament, argued for the purchase by the nation of Robert Walpole's superb Houghton Collection, but to no avail. When Catherine the Great moved it to Russia, a commentator on this occasion protested: "The riches of a nation have generally been estimated according to as it abounds in works of art. . . ."^[7] In 1811 the Dulwich Picture Gallery opened as the first public art gallery in Britain. The collection was given to Dulwich College in the absence of a national gallery. Arguments for a national collection grew, although the Royal Academy of Arts wanted national to be defined as British art only. In 1824 the connoisseur George Beaumont donated his collection to the nation, Parliament voted funds and the National Gallery was born. In competition with schools and sewers, it remained underfunded in spite of the arguments of Radical thinkers that access to works by Old Masters would improve the level of taste and thus make British textiles more competitive with the high-end products of France and Germany and that free entry would wean the working class off drink.^[7] In the second half of the century, municipal museums spread around the country. In response to the demands to show British art, and as a condition of Sir Henry Tate's gift of his collection, the Tate Gallery was spun out of the National Gallery in 1894 (but had its remit expanded to international modern art in 1917).

Art Museums in the United States

While some museums in the United States were established in the first half of the century (Wadsworth Atheneum, Hartford, CT, 1842), most were formed in the economic boom that followed the Civil War, in the great growing cities of the North and in many of the smaller cities as well. The Metropolitan Museum of Art in New York was founded in 1870, the Museum of Fine Art in Boston in the same year, the Philadelphia Museum of Art in 1876, the Art Institute of Chicago in 1879, the Los Angeles County Museum of Art in 1910, and the Cleveland Museum of Art in 1916. These museums were established by wealthy donors who wanted prestige for

their cities and for themselves. Whereas in Europe access to museums was symptomatic of the bourgeois struggles to end aristocratic privilege, in the United States museums were overt displays of privilege.^[8] The titans of industry and commerce collected on a grand scale, often aided by the great dealer Sir Joseph Duveen: Altman, Frick, Johnson, Kress, Morgan, Mellon, Walters, and Widener gave their works away to existing museums or to new ones that preserved their heritage and gave prominence to their names. When the Metropolitan Museum expanded in 1925, the *New York Times* commented that the Met was "not so much an institution for the instruction and pleasure of the people as a sort of joint mausoleum to enshrine the fame of American collectors."^[8] In a salute to them, the Met organized in 2007 an exhibition of all its seventeenth-century Dutch art, *Rembrandt and his Time*. The art was presented neither chronologically nor by artist but by the date when the works were acquired. Andrew Mellon, more self-effacing than most, donated his collection to create the National, rather than Mellon, Gallery of Art in 1937.

The art museum was to serve many purposes, besides the obvious ones of providing enlightenment, education, and pleasure: first, to prove that the dynamic American economy knew the value of higher things. At a dedication in Chicago in 1913, the sculptor Loreda Taft said "art and culture had arrived to crown commercial life as was crowned commercial life of Athens and Florence and Venice."^[8] Since Europe was the model, it was predominantly European art that was collected in preference to American art which was often considered inferior. "During the late nineteenth and early twentieth century, history's largest transfer of cultural wealth from one hemisphere to another took place."^[9] Second, since the church, separated from the state, could not provide homogeneity of values for the disparate immigrant hordes, impressive museums were to be organs of acculturation, providing a set of core values. Third, galleries with displays of decorative arts modeled on those in the influential Victoria and Albert Museum in London (founded in 1857 as the South Kensington Museum and renamed in 1899) would provide the lower middle classes with aspirational models for their households and inspire manufacturers to produce goods of superior design.

Art Museums in the Modern Period

Two world wars and dire economic conditions put a damper on museum building until the 1950s. But from then on the momentum of building new museums and museum extensions gathered pace. Collections grow and need to be shown to the public rather than being kept in storage. Funding shifted from almost complete reliance on a few wealthy patrons, who, while still very much in evidence in the United States, were joined by corporations, foundations, and museum members, with agendas of broadening audiences and enhancing access.

Art museums have become less stuffy and are gathering places for the community, with gourmet restaurants, high-end stores, and sought-after venues for weddings and receptions. They have become more popular—too popular for some who fear the spread of commercialism.

Notable new museums or extensions of the second half of the twentieth century that were architecturally adventurous included the extension to the Kröller-Müller Museum in Otterloo, Holland, designed by Henry van de Velde (1953); the Milwaukee County War Memorial, Wisconsin, United States, by Eero Saarinen (1957) containing the Milwaukee Art Center; the Louisiana Museum of Art, Humlebaek, near Copenhagen, Denmark, by Jorgen Bo and Vilhelm Wohlert (1958); the Whitney Museum of American Art, New York, by Marcel Breuer (1966); the Hayward Gallery, London, by London County Council architects, part of a cultural center on London's South Bank (1968); the Neue Nationalgalerie, Berlin, West Germany, by Ludwig Mies van der Rohe (1968); the Kimbell Art Museum, Fort Worth, TX, by Louis Kahn (1972); the Sainsbury Centre for the Visual Arts, Norwich, England, by Norman Foster (1977); the East Wing of the National Gallery of Art, Washington, D.C., by I.M. Pei (1978), and Pei's pyramid for the Louvre (1989); Neue Staatsgalerie, Stuttgart, West Germany, by James Stirling and Michael Wilford (1984) and their Clore Gallery extension to London's Tate Gallery (1986); the Menil Collection, Houston, TX, by Renzo Piano (1987); the Museum of Contemporary Art, Barcelona, by Richard Meier (1995) and his Getty Center in Los Angeles (1997); the Quadracci

Pavilion extension to the Milwaukee Art Museum by Santiago Calatrava (2001) (Fig. 1), the de Young Museum, San Francisco, by Herzog and de Meuron (2005); the Bloch Pavilion at the Nelson-Atkins Museum of Art, Kansas City, MO, by Stephen Holl (2007); the Hamilton Building at the Denver Art Museum, Colorado, by Daniel Libeskind (2007); the Broad Contemporary Art Museum at the Los Angeles County Museum of Art, by Renzo Piano (2008), and his extension for the Art Institute of Chicago (2009). Museums provide rare opportunities for architects to show talents not sought in commercial real estate development.

The explosion of modern art from the early part of the twentieth century onward presented art museums with a dilemma: to collect only art that had stood the test of time or to collect challenging contemporary art. The solution most commonly adopted was to lag well behind the times, thus creating a gap for new museums for new art in new buildings.

The unrivalled pioneer and a model for others, the Museum of Modern Art (MoMA) in New York was set up under its formidable director Alfred H. Barr in 1929 and moved into its first purpose-built structure on West 53rd Street, designed by Philip Goodwin and Edward Stone, in 1939. The Museum embraced all aspects of visual culture with departments of architecture and design, film (and later video and digital), and photography. The latest and largest of several expansions, by Yoshio Taniguchi, opened in 2004, and has made MoMA a must-visit attraction.

The industrialist Solomon R. Guggenheim began to show his extensive collection of “nonobjective art” from the 1930s and, advised by Hilla Rebay, he continued to collect until his death in 1949. Ten years later (and six months after the death of the architect, Frank Lloyd Wright), the museum bearing his name opened on Fifth Avenue. The startling round shape and spiral gallery of the Guggenheim signaled the new adventurousness in architecture, and set off a continuing debate on whether dramatic new museum buildings outshine the art inside them.

In France, discussions were held about creating a modern art museum in Paris in the 1930s, but the war intervened. Making up for lost time, the Pompidou Center in the Palais Beaubourg was opened in 1977, housing a library and contemporary music center as well as a huge collection of modern art. The young architects who won an international competition, Richard Rogers (English) and Renzo Piano (Italian), introduced new concepts: large spaces unimpeded by columns, services on colorful display instead of being hidden, a feeling of openness and transparency. It was and has remained a huge popular success.

In 1997 the Guggenheim Bilbao, an asymmetrical sculpture clad in titanium designed by American architect Frank Gehry, opened to international notice and visits. The museum was paid for by the Basque government as part of a comprehensive economic development plan to reinvigorate a failing industrial area. Since the opening of Guggenheim Bilbao, other cities have been opening new museums and museum additions hoping for a “Bilbao effect,” but without the accompanying investment in subways, airports, and infrastructure. The art came from the extensive collection of the Guggenheim Foundation, and other Guggenheim branches were opened in Las Vegas (with Russia’s Hermitage in 2001; it closed in 2008), Berlin (with Deutsche Bank, 1997) and another vast one also designed by Frank Gehry is planned for Abu Dhabi. The Peggy Guggenheim Collection opened in Venice in 1951 and is part of the international family.

In 2000 the international modern and contemporary art collections of Tate (in rebranding having lost “the” and “Gallery”) were split off into Tate Modern and installed in a disused power station remodeled by the Swiss architects Herzog and de Meuron who had won an international competition. The cavernous Turbine Hall is transformed each year with an installation by a contemporary artist. The combination of the drama of the building, an enticing art program, the site on a revived stretch of river, and, importantly, free general admission (with payment for special exhibitions) has made Tate Modern one of the most popular art museums in the world, with an annual attendance of some 5 million.

Museums focusing variously on modern or contemporary art sprung up in San Francisco (1935), Chicago (1967), and Los Angeles (1979). The Boston Institute of Contemporary Art opened a bold building by Diller and

Scofidio in 2006, and the New Museum of Contemporary Art opened a subtle and complex building by the Japanese practice SANAA on New York’s Bowery in 2007. Some institutions such as the Institute of Contemporary Art in London (1947) and the Walker Art Center in Minneapolis (originally 1927; focus on contemporary in the 1940s) have spaces for dance, theater, and film.

Many traditional museums like the Metropolitan Museum have long collected modern art as the passage of time venerates it into art history, but in recent years, seeing the popularity of contemporary art, they have been less and less willing to cede a monopoly of the new to specialist museums. The large and elegant extension to the Art Institute of Chicago is called the Modern Wing and contains modern art, contemporary art, photography, design and architecture, and sets a challenge to Chicago’s forbidding Museum of Contemporary Art, designed by Josef Paul Kleihues (1996).

Some of the underlying reasons for the building boom mirror those of the nineteenth century: pride in city, economic prosperity, a cause and consequence of higher education. A new driving force is the wish to stimulate the creative economy as the manufacturing economy moves to low-wage countries and attract those industries whose workers are looking for quality of life and not just quantity of salary.

The spate of museum building has fostered criticism that the star architect or “starchitect” usually commissioned often create grandiose structures that deflect attention from the art to their own creations. Victoria Newhouse, in *Towards a New Museum* is the most influential of such critics.^[10]

ETHICS AND GOVERNANCE

Museums are repositories of values as well as of objects. Those who control the museum should regard themselves as stewards and trustees, not owners: they have to act unselfishly for the long-term good of the institution. The museum should safeguard and protect the art it collects for future generations, and that includes cataloging and documentation. The museum should be run by the museum’s director and staff with integrity and in accordance with the highest ethical principles and with professional standards. Written policies should cover key areas such as acquisition, deaccessioning, and loans. The museum should have a mission statement and a long-range strategy or plan that ensures long-term financial stability. While overseeing management, trustees should not become involved in it. Trustees should avoid conflicts of interest.

Museums should be run in a businesslike way, but they are not businesses. They often do things that puzzle the business mind, like putting on an expensive exhibition that is artistically worthwhile even though it will not draw in a large audience. Of course such a course of action is only

sensible provided the resources are available to pursue it, but the very notion can raise the business eyebrow.

In the United States, the usual pattern is to have a large board to encompass wealthy individuals, collectors, captains of local industry and commerce, civic leaders, ethnic minorities, and local politicians. Much work is typically done in committees. Museums can readily tap local expertise to create strong committees of finance, audit, investment, remuneration and human resources, and fund-raising. Committees for acquisition, exhibitions, and education have mixed motives: oversight and advice, but also to engage members so that they are more likely to be generous to the museum.

Museums are porous. They are influenced by trustees, by members, by support and special interest groups, by donors, by local politicians, by community groups, and of course by the public, who have access to each other and to the director and to the staff. It is up to the director to ensure that the museum is led rather than being led. It is up to the chairman of the board of trustees to ensure that the director is supported in leading. It is up to the trustees to ask the tough questions to ensure that the direction in which the director is leading is sensible and fiscally responsible.

In Britain, boards are smaller, and at Tate and the National Portrait Gallery their members include artists. In the rest of Europe, museums are typically under the control of the state or of a local municipality with perhaps an advisory board of lay people.

MONEY AND OTHER MEASUREMENTS

Broadly, art museums in the United States are financed by the private sector, in Europe by the state, and in England by both. It must be remembered that in the United States the federal government is a “silent partner.” As part of a long-standing policy of encouraging the not-for-profit sector, charitable donations of money and of art can be deducted by individuals from their taxable incomes, and so their giving is subsidized. Britain under a Labour government has moved towards the American practice of making it attractive to give money to museums and other charities.

This is an age of measurement and evaluation. What are the “outputs” and “deliverables” by which a board can judge its management and a community its museum?

The annual operating statement of a museum should demonstrate that revenues and expenses are in balance. There are three categories of operating revenue: contributed (donations, grants from foundations, sponsorship, government support); earned (admission fees, typically 5–10% of revenues), membership (sometimes categorized as contributed), store, café, rental, exhibition fees); and transfer from endowment funds (usually set at between 4% and 6% of the value of endowment assets). The higher

the endowment in relation to the other sources of revenue, the greater the likelihood of fiscal stability; the smaller it is, the more the museum has to depend on courting donors or earning more. Expenses are usually categorized by function—curatorial, education, development, marketing, administration—and by type—of which salaries and benefits is the largest, typically about half of operating costs. A persistent operating deficit indicates a mismatch between ambition and means and should send out a warning to the board to take action.

The number of people who come to visit a museum is clearly an important indicator of how it is connecting to the community. If a museum is heavily dependent on admission revenue and store and café revenue that goes up and down with foot traffic, then the number of tickets sold is obviously of great concern. However, if a museum is tempted to put on exhibitions intended purely to draw a crowd, then it is substituting for the high-minded mission of bringing art to the people the less noble one of bringing people to the museum any way it can. There is a possible cost in credibility and integrity. The Solomon R. Guggenheim Museum put on an exhibition on the *Art of the Motorcycle* in 1998, sponsored by the car and motorcycle manufacturer BMW, that was criticized on just those grounds.

A better way of making museums more accessible is to abolish admission fees. During the Thatcher government of the 1980s, the major British museums were set free of control by the Treasury (ministry of finance) and encouraged to raise more money from the private sector and charge for entry if they wished. Many did. In 2001 the Labour government abolished admission fees: the result has been a dramatic increase in visitorship. The profile of visitors did not change, but since there were many more of them, the number of less-affluent visitors did go up in absolute terms. The Walters Museum of Art in Baltimore and the Baltimore Museum of Art were both given extra money by the city to allow free admission in 2006, and the Indianapolis Museum of Art, which has a large endowment, went back to free admission in 2007.

In an influential paper entitled “Metrics of Success for Museums,”^[11] Maxwell Anderson, now director at the Indianapolis Museum of Art, argues for looking at measures of quality such as the number of scholarly publications, the size of the library, and loans made to other museums in an attempt to free museums from chasing numbers of bodies. It remains true that the most important function of a museum—the experience of being moved by or challenged by or uplifted by a work of art—is problematic to measure.

EXHIBITIONS

Most museums put on exhibitions of works of art brought especially together from one or many lenders. While not a

new phenomenon, the size and frequency of exhibitions grew from the 1970s and museums carved out space devoted specifically to them. Some of these exhibitions are labeled “blockbusters,” a term of praise in the cinema but of mild abuse in museums. Exhibitions such as *Monet in the Twentieth Century*, mounted by the Royal Academy of Arts in London and the Museum of Fine Arts in Boston in 1998, and *Picasso/Matisse*, mounted by Tate and MoMA in 2000, brought huge crowds. The Royal Academy set a trend for such exhibitions by being open all night on the last Saturday of the run. The Monet exhibition drew attention to the twentieth century art of a great artist considered as a nineteenth century figure and the Picasso and Matisse exhibition explored the creative rivalry between two great twentieth century artists. They were great visual experiences but the exhibitions added to scholarship and understanding. Popularity was the by-product. However, given the appeal of Impressionist and Postimpressionist artists, for example, there have been exhibitions of them where popularity was the goal, and this has generated debate about the role of all temporary exhibitions, blockbuster or otherwise.

The case against blockbuster shows begins with the argument that exhibitions detract attention and curatorial and other resources away from the museum’s own collection. The public is led to expect a linear progression of art and argument and then finds the collection dull by comparison. Fragile works of art traveling to the several venues of a tour have to endure the hazards of transportation. Marketing departments are let loose in ways that undermine the mission of the museum. Museums follow the false gods of money and attendances. On a proper allocation of expenses, including overhead, they do not really make a profit. The attendant exhibition store and special merchandise bring commercialism into the museum.

The case for blockbusters is that such exhibitions bring a focus on an artist or theme that would be impossible in any other way. They enable scholarship that would otherwise not get done. They do bring a sense of event and excitement to the museum that does, indeed, usually bring in a higher audience—an audience for whose time and attention museums are in competition with a plethora of other activities. The appropriate exhibition can bring in minorities that do not usually come to museums: *The Quilts of Gee’s Bend*, an exhibition of quilts by African-American women, attracted the local black population wherever it was shown. Exhibitions are exciting for the public and for curators. They foster international collaborations.

Museums have reacted to the criticism by making more of an exhibition of the “permanent” collection. Tate Britain rotates the display of its collection annually. The Metropolitan Museum’s exhibition of Dutch art referred to above came entirely from the Met’s own collection. However, it remains a true criticism of many museums

that scholarship and publication of the collection have taken second place to exhibition-making.

GLOBALIZATION

The Guggenheim Foundation, rich in collection and poor in endowment, has a strategy of international expansion on the Guggenheim Bilbao model: to lend its curatorial and architectural expertise, traveling exhibitions, and collection in return for a fee. Lest this be seen as the exclusive preserve of American institutions following the profit-maximizing strategies of global corporations, the government-financed Louvre has agreed to do exactly the same thing with a rich Gulf oil state. In March 2007, France and Abu Dhabi agreed to the Abu Dhabi Louvre, with the Louvre benefitting to the tune of approximately \$1 billion. The architect is Jean Nouvel, thus providing France an opportunity for one of its star architects. Protesters argued that the Louvre was selling its soul, exporting culture for cash and contributing to the Disneyfication of artistic experience. The full meaning of these international exploits has yet to sink in. Since museums are busy digitizing images of their works of art to make them internationally available, why not follow up by making some of the real works themselves viewable in conditions set by museum professionals? Is it not better to have the works on display than in storage? But if the works are from storage, is the museum sending its best works out? The director of the Louvre, Henri Loyrette, is keen on enhancing the international brand of the Louvre, and has sent part of the collection on long-term loan for a fee to the High Museum in Atlanta. Is it too commercial to use the consumer-goods concept of branding for a museum—or is he simply being realistic about the way the world now works? The Louvre is a national museum, financed by the state, and should one argue if the state wishes to add a cultural dimension to its diplomacy?

OWNERSHIP OF ART

In late 2007 the Russian authorities threatened to cancel a blockbuster exhibition of art from four Russian collections at the Royal Academy of Art in London. The exhibition was already installed in Dusseldorf, Germany. Germany has a law that prevents the filing of legal claims for the restitution of art in loan exhibitions; Britain had delayed the implementation of such a law. The Russians, fearing a suit from an heir of the Shchukin family, whose art has been confiscated after the Russian Revolution, said they were too worried to lend (the deterioration in relations between Britain and Russia also played a role: art is a weapon of diplomacy). The law was brought forward in Britain, and the crisis defused. The United States has a similar law in place, though with loopholes. While

sensible to protect cross-country traveling exhibitions in this way, the incident did highlight one of the major issues facing museums in recent years: giving back art to its rightful owners. This issue has four main strands.

The first is confiscation under totalitarian regimes in the twentieth century. Russia's current government does not accept that confiscation during the revolution is an act for which restitution needs to be made. During the Nazi era, art owned by Jews was either confiscated, or fleeing Jews were forced to sell for low prices. After several decades of prevarication, and under pressure from the American Department of State, the German museums and their municipal owners have been cooperating in giving back to heirs art where there is good evidence of ownership. The Austrians have been less helpful. Museums in Europe and the United States are under pressure to research the provenance of Nazi-era acquisitions. In 1998 the AAMD issued guidelines encouraging American museums to research their collections and if they suspect they have such works to try and trace the heirs, and if they cannot find them, to publish any details known about the work.

The second strand is antiquities that might have been looted. The Italian and Greek authorities have since the early part of the twenty-first century been active in pursuit and in 2007 the Getty Museum and the Met were obliged to give back important objects once they were confronted with good evidence that these objects had been looted. Art museums are under pressure not to acquire objects whose provenance back to 1970—the date of a UNESCO resolution—is not clear. Some feel that the imposition of this arbitrary date will mean the disappearance of such objects on the market into the hands of private collectors and that it would be better to acquire them for the public realms and display them and publish what is known on the Web.

The third strand concerns objects collected by museums during their ethnographic phases that turn out to be sacred to the peoples that once owned them. The American government passed the Native American Graves Protection and Repatriation Act (NAGPRA) in 1990 to provide a process to return certain Native American cultural items to living descendants and affiliated Indian tribes. Australia and New Zealand have similar policies.

The fourth is what might turn out not to be the special case of the Elgin Marbles, bought for the British Museum by Lord Elgin from the Ottoman Empire, the then occupying power of Greece. The Elgin Marbles (also known as the Parthenon Marbles) are ever more actively being sought by the now sovereign Greek government that in 2007 opened a museum to house them on their return. The British Museum, the Metropolitan Museum, and the Louvre, the three great encyclopedic museums of the world, argue that it is in the interests of everyone for antiquities marking the birth of Western civilization to be dispersed rather than given back to governments who happen now to govern the territories from which they once derived.

CONCLUSION

This entry has concentrated on art museums as institutions rather than on the art within their walls.

We are in an age that values imagination and creativity. We are also in the digital age. We are in an age of a profusion of visual images. Art sparks the imagination. In a screen-based society, people increasingly appreciate the single, authentic object. Contemplation of art in museums provides a welcome respite from the rush of imagery. The boom in art museum expansion is likely to continue after the 2009 recession is over, provided that museums remain true to themselves.

In an influential book of essays by leading museum directors entitled *Whose Muse*,^[12] James Wood, then director of the Art Institute of Chicago and subsequently president of the J. Paul Getty Trust eloquently sums up the implicit contract of museums with the public:

Ultimately the American art museum's authority must flow from its ability to be one of the most tangible and accessible forums for the experience of excellence, the affirmation of tolerance, the appreciation of personal expression, and the pursuit of the individual happiness embodied in our Constitution. Guaranteeing the integrity of this forum has never been more important, and to the degree that we succeed, our museums will indeed be worthy of the public trust.

Artificial Intelligence

Jianhua Chen

Computer Science Department, Louisiana State University, Baton Rouge, Louisiana, U.S.A.

Abstract

Artificial intelligence (AI) is a multidisciplinary subject, typically studied as a research area within Computer Science. AI study aims at achieving a good understanding of the nature of intelligence and building intelligent agents which are computational systems demonstrating intelligent behavior. AI has been developed over more than 50 years. The topics studied in AI are quite broad, ranging from knowledge representation and reasoning, knowledge-based systems, machine learning and data mining, natural language processing, to search, image processing, robotics, and intelligent information systems. Numerous successful AI systems have been deployed in real-life applications in engineering, finance, science, health care, education, and service sectors. AI research has also significantly impacted the subject area of Library and Information Science (LIS), helping to develop smart Web search engines, personalized news filters, and knowledge-sharing and indexing systems. This entry briefly outlines the main topics studied in AI, samples some typical successful AI applications, and discusses the cross-fertilization between AI and LIS.

INTRODUCTION

This entry is about artificial intelligence (AI),^[1–4] a multidisciplinary subject, typically studied within Computer Science. Ever since the dawn of civilization, humans have constantly asked questions regarding mechanisms of human intelligence. Human's abilities to think, reason, learn, act to achieve goals, adapt to changing environment, etc., which are central to intelligence, fascinated philosophers, scientists for centuries. There is a long history of human endeavor in unveiling the mystery of human intelligence and building artificial systems capable of doing smart things like humans do. The early works in understanding human intelligence focused on studying how humans "know" the world around them and how the human thinking and reasoning are performed. As early as 2300 years ago, Aristotle, a great Greek philosopher, studied the laws of thought and proper ways of reasoning. In his work "Prior Analytics,"^[5] Aristotle defines syllogism, a kind of logical argument, which allows deduction of a valid conclusion from two given premises. For example, from the premises that "All men are mortal" (major premise) and "Socrates is a man" (minor premise), one can infer by syllogism that "Socrates is mortal." Over the long time after Aristotle, logicians such as Freg, Russell, Leibniz, Godel, Tarski, and others, have fully developed formal logic systems such as propositional logic and predicate logic, which formalize the thinking and reasoning process of humans. Moreover such formal logic systems open up the possibility of being implemented on computational systems.

Endeavors of constructing mechanical/electronic artifacts to do calculation, concept manipulation, reasoning, and game playing can be found in many eras of human

history. Such efforts contribute significantly to the foundations of AI. See Entry 1.1^[1,2] for more discussions on the foundations of AI. Around twenty-sixth century B.C., the Chinese invented the abacus, the first mechanical tool in human history for performing arithmetic calculations (Entry 1.1.1).^[2] Similar calculating equipments were also discovered in Roman relics, in India, and Egypt from ancient times. In 1623, Wilhelm Schickard, a German mathematician, created a calculating clock for addition and subtraction. Soon after in 1642, the famous calculating machine Pascaline was created by Blaise Pascal, a great French philosopher and mathematician. Pascaline is capable of addition and subtraction with carries and borrows. Pascal noted^[6] "The arithmetical machine produces effects which approach nearer to thought than all the actions of animals." Gottfried Wilhelm Leibniz, a great German philosopher and mathematician, believed that human reasoning could be reduced to mechanical calculations of some kind, and thus one could use the calculation results to find out who is right and who is wrong in cases of conflicting opinions. He wrote^[7]

The only way to rectify our reasonings is to make them as tangible as those of the Mathematicians, so that we can find our error at a glance, and when there are disputes among persons, we can simply say: Let us calculate [calculemus], without further ado, to see who is right.

He envisioned that a machine could be devised for automatic derivation of scientific knowledge by deductive inference. In the late 1950s and early 1960s, amid the initial enthusiastic development of AI, Arthur Samuel developed^[8] a computer program that learns to play the game of Checkers, which could learn to improve its

game-playing skills by playing against a copy of itself, playing with human players, and storing good moves from Master game books. In 1997, IBM's Deep Blue Chess program,^[9] with a combination of parallel processing, fast search, and AI ideas, scored a historical win against world Chess champion Kasparov.

As can be seen from the brief descriptions above, the philosophical roots of AI can be traced back to over 2300 years ago. The recent past 200–300 years have witnessed a rapid development in mathematics and science. The formalization of mathematics and science has laid the intellectual foundations of AI. AI as a multidisciplinary area draws on the development in diverse disciplines in addition to philosophy and mathematics, including economics, psychology, linguistics, control theory and cybernetics, and neurosciences. In particular, the birth of the electronic computer in the 1940s was instrumental and crucial to making AI a viable distinctive scientific discipline within Computer Science. The availability of digital computers in late 1940s made it possible for researchers at that time to write computer programs for playing games, performing logical reasoning, and problem-solving. Researchers could then empirically study the computer's performance and analyze whether the computer demonstrated some kind of intelligence. In 1956, at Dartmouth College in Massachusetts, a two-month summer workshop was held^[1] and attended by 10 prominent researchers of AI, including John McCarthy, Marvin Minsky, Claude Shannon, Arthur Samuel, Allen Newell, and Herbert Simon. The workshop was a milestone that signified the birth of AI—a name suggested by McCarthy and agreed by all the attendees of the workshop.

In the early 1950s, researchers and the general public were all fascinated by the possibilities made prominent by the advent of the electronic computer era. People asked numerous questions about whether computers could be intelligent, e.g., do things that used to require human intelligence, what is intelligence, what would it take for us to consider a computer to be intelligent. Objecting views were raised by many to the idea that indeed a computer could be intelligent given sufficient storage memory and processing power. Alan Turing, a great British mathematician and considered by many as the founding father of Computer Science/AI, proposed in 1950^[10] the famous Turing test. Turing proposed to replace the question “Can machines think?” by the question of whether a digital computer can pass the Turing test. In the Turing test, a human interrogator converses in natural language with a computer and a human participant, that are located in rooms separated from the interrogator. The questions from the interrogator and the answers from the computer/human participant are transmitted via online typed messages (similar to today's computer-relayed talk or instant messaging). After conversations for 5 min, the human interrogator needs to identify which one is the computer/human participant. According to Turing, a computer should be

considered as “intelligent” if it passes the Turing test, i.e., if it fools the human interrogator over 30% of the time in many repeated trials. The central idea behind the Turing test is that a system is deemed intelligent if it can behave like humans. This conceptualization of intelligence (behaving like humans) makes it easier to discern intelligence because one does NOT need to know the inner workings of a system to judge whether the system is intelligent or not—it is sufficient to just look at the system's behavior. Turing predicted that by the year 2000, man could program computers with large storage capacities (109 units) so well that the computers would easily pass the test with an average human interrogator. Although his prediction was not realized, the discipline of AI certainly has achieved great advancement over the 58 years from the proposal of the Turing test.

After over 50 years of development, AI has become an industry and a gradually maturing subject. Theories of AI—computational theories of intelligence, have advanced significantly, with many flourishing research topic areas developed and numerous successful AI systems deployed in real-world applications. Today, we enjoy the great benefits of modern computer and information technology in our daily lives, many with important AI components. We have smart online shopping tools that can recommend suitable products catering to the specific preferences of customers; personalized message filtering tools that help to sort out spam e-mails; robots that perform (or assist doctors to perform) medical procedures with great precision; intelligent online information tools that allow us to know what is going on in the world with the click of a mouse, and to obtain, create, and share knowledge efficiently. We have seen the great miracle of electronic computers and AI that our great intellectual pioneers have envisioned, and much much more. Today, AI is more exciting than ever as a research area, playing an increasingly important role in the age of information technology. See Buchanan^[11] for a brief account of AI history.

The rest of the entry is organized as follows. In the next entry, the major topics of AI will be briefly described. Entry on “Artificial Intelligence and Application” presents some sample applications of AI, along with a brief discussion of the impact of AI on Library and Information Science (LIS), and is followed by the conclusion. Readers interested to know more about the AI subject can consult leading text books^[1–3] and other online sources.^[4]

TOPICS OF STUDIES IN AI

In this entry we survey some representative topics of AI study. Since AI is a very big and broad field, it is impossible to make a complete coverage of all topics of AI within the limited space of one entry. The omission of a topic in

this entry is by no means an indication that the topic is not important.

Heuristic Search and Problem Solving

Heuristic search is a topic studied since the early days of AI. Researchers realized long ago that many AI problems could be viewed as a search problem. The concept of problem-solving as state space search was introduced in the 1950s.^[12] In problem-solving, each possible scenario related to the task at hand is formulated as a state, and the entire collection of all possible states is called the state space, which contains the initial state of the problem, and the desired solution state (often called goal state). A state S has a number of neighboring states $N(S)$ which could be reached from state S in one step (by applying some state-transition operators). A state space could then be modeled as a (possibly weighted) graph with nodes representing states and edges connecting neighboring states. Given this view, solving a problem amounts to searching the state space (graph) to find a sequence of states that leads from the initial problem state to the goal state. For example, in computer checkers game playing, each feasible board configuration constitutes a state in the search space. The initial state corresponds to the initial game board configuration and a board configuration in which the player (the computer) has won the game is one of the many goal states. A move of a piece in board configuration S transits it into a board configuration which is a member of $N(S)$. The problem of playing the checkers game successfully against an expert human player is reduced to finding a sequence of moves (states) in response to the human player's moves such that the final state is a winning state for the computer.

For most search problems with real-world application, the search space is huge (or even infinite). Any blind exhaustive search method (such as breadth-first search, depth-first search) would suffer from combinatorial explosion that renders such search impractical. How to efficiently search the state space becomes a critical issue if we want to build useful AI applications. Heuristic search methods have been developed by AI researchers^[13] to efficiently search the state space and overcome combinatorial explosion. Typical heuristic search methods are based on using a heuristic evaluation function h to guide the search process. The best-known heuristic search algorithm is perhaps the A^* algorithm^[14] for searching a weighted graph for shortest path from the starting node ns to the destination node nd . The algorithm maintains a list of open nodes and a list of closed nodes. Each open node n corresponds to a current partial path $ns, \dots, n$ which could be extended into a path from ns to nd via n . For each open node, a measure $f(n) = g(n) + h(n)$ is used to estimate the length of the shortest path from ns to nd via n , where $g(n)$ is the actual length of the path $ns, \dots, n$ and $h(n)$ is the heuristic estimate for the length of the shortest

path $n, \dots, nd$. The A^* algorithm always selects from the open list the node n with the lowest $f(n)$ value, considers the neighbors of node n for expanding the current partial path in search for the shortest path from ns to nd . It has been shown^[14,15] that if the heuristic function h is admissible, namely $h(n)$ is always an underestimate of the actual length of the shortest path from node n to nd , then the A^* algorithm is optimal in that it is guaranteed to find the shortest path from ns to nd . Various improvements of the A^* algorithm have been proposed in the literature, including memory bounded A^* (MA) and simple memory bounded A^* (SMA), etc.

In using heuristic search for problem solving for specific applications, the design of the heuristic function h is a nontrivial task. One has to carefully analyze the specific problem at hand, formulate the search problem, and choose the h function by considering characteristics of the problem to be solved.

Knowledge Representation and Automated Reasoning

An intelligent agent must “know” the world around it, have knowledge about how to achieve goals (namely, what actions are needed to bring about a desired outcome), and can infer useful information from what it already knows in making intelligent decisions. Therefore, an intelligent agent should be a knowledge-based agent, with the ability to represent knowledge and perform automated reasoning from its knowledge.

Knowledge representation research (KR)^[16] studies and develops formal systems for representing knowledge in a knowledge base, whereas automated reasoning research^[17] focuses on finding efficient algorithms for inference from a given knowledge base represented in some formalization. These two areas of study are closely related.

Logic-based formalism is perhaps the most commonly used knowledge representation form in AI systems. See Genesereth and Nilsson^[18] for more discussions of logical foundations of AI. Under a logic-based knowledge representation scheme, an intelligent agent's knowledge base is a set Δ of logical sentences in the representation logic language, and the inference problem faced by the agent becomes the problem of deriving logical consequences of Δ using valid inference rules of the logic. Propositional logic and first-order logic are most frequently used in practice for knowledge representation and reasoning.

When using logic as a tool for knowledge representation, one has to first define the syntax of the language for the logic, which specifies the basic symbols, logical connectives, and rules to formulate well-formed expressions (well-formed formulas) in that logic. For example, in propositional logic, the basic symbols are propositional symbols (typically represented by uppercase letters such as P, Q, R) each representing a proposition that can be true

or false. The logical connectives in propositional logic includes $\wedge$, $\vee$, $\neg$, etc. So if P , Q are propositional symbols, then $P \wedge Q$, $P \vee Q$, and $\neg P$ are all well-formed formulas in the logic.

A logic must define the semantics of the language. Intuitively, semantics defines the “meaning” of well-formed formulas. The semantics of a logic defines the truth value of each formula for each possible world. The truth value for any well-formed formula in a possible world is obtained compositionally from the truth value of the basic proposition symbols in that possible world. For example, consider a propositional logic with two proposition symbols P and Q , where P stands for the proposition “John is a professor at Harvard” and Q denotes the proposition “John lives in Boston.” Here we have totally 4 possible worlds: $\{TT, TF, FT, FF\}$, where each possible world spells out the truth value assignment for P and Q , in that world. For example, the possible world “TF” tells us that P is true and Q is false in this world. Thus in this world, the well-formed formula “ $P \wedge Q$ ” will be assigned the truth value “false (F)” because “ $P \wedge Q$ ” is true in a possible world if and only if both “ P ” and “ Q ” are true in that world.

Once the semantics of a logic is defined, we can use logic for the purpose of reasoning, namely, we can ask the question, “can we derive conclusion ϕ given our knowledge base Δ ”? This is the problem of checking whether ϕ is a logical consequence of Δ —whether ϕ is true in all possible worlds in which Δ is true. Automated reasoning is responsible for this task. Automated reasoning research aims at finding efficient, valid inference algorithms to support derivation of logical consequences. For automated reasoning in propositional logic and first order logic, AI researchers pioneered by Alan Robinson have developed the resolution inference rule^[19] and many of its variants. Since the logical reasoning problem in propositional logic is essentially reduced to the satisfiability (SAT) problem, which is known to be computationally hard, many heuristic methods have been developed which aim to find efficient solvers for the SAT problem.^[20–22] The development of resolution-based inference in first-order logic and the drive for a unified language for declarative knowledge representation and automated reasoning have led to the logic programming technique, hallmarked by the language PROLOG.^[23] In using PROLOG, one represents knowledge by a PROLOG program, and automated reasoning is carried out by the PROLOG interpreter which essentially performs resolution.

Researchers have developed a plethora of non-monotonic logics for representing commonsense knowledge in the 1980s and 1990s. The idea is based on the observation that human commonsense knowledge is not well represented by propositional or first-order logic, so something new needs to be developed. Among the various frameworks proposed, we have Reiter’s Default Logic,^[24] McCarthy’s circumscription,^[25] etc. The studies

on non-monotonic logics and reasoning are closely related to the study of logic programming. Logics for dealing with time, events, knowledge, and belief have also been developed by AI researchers in order to more accurately model the real world. For example, situation calculus^[26] and event calculus,^[27] and temporal logic^[28] as well as logic about actions^[29] deal with time-event-action related representation issues. Various logics on knowledge and beliefs^[30] handle problems of representing (and reasoning about) beliefs and knowledge.

Knowledge representation studies involve not only developing formalisms (logic, etc.) for representing the real world, but also methodologies as to how to model the real world and represent the model within the chosen formalism. Generally speaking, decision on how to represent the world would require the identification of an ontology, which specifies the concepts (categories) for modeling the world and the taxonomy (inheritance hierarchy) relating the concepts. Other semantical relationships among concepts can also be included in an ontology. For example, when building an ontology for a university, we would identify concepts such as students, professors, courses, departments, employees, staff, etc. We can also organize the people in the university into a taxonomy (a tree) T with top node labeled as “person.” The two children nodes below the root would be labeled by “student” and “employee,” indicating a student is a person, and an employee is a person too. We could also identify other semantical relationships among concepts in this domain: for example, the relationship “enrolled-in” can be identified between “student” and “course,” indicating that students take courses. This kind of ontology specification bears close similarity with Semantic Networks,^[31] a representation scheme developed in early years of AI research. Clearly, tools supporting the construction and maintenance of ontologies are highly desirable. Current research on knowledge representation appears to focus on developing formal systems and tools for representing and processing ontologies with applications in the Semantic Web.^[32] This includes the studies of a unified knowledge representation framework based on XML, RDF, OWL (Web Ontology Language),^[33] etc. and development of tools for extracting/editing ontologies using the unified representation, and studies of inference procedures for query-answering with such representations. Some current works investigate the problem of knowledge acquisition by agent with commonsense knowledge formalized by some logic.^[34]

Machine Learning

An intelligent system must have the ability to learn new knowledge so as to adapt in an ever-changing world around it. Machine Learning^[35,36] study focuses on developing computational theories and algorithms that enable computers to learn. Since the early years of AI

development, many researchers have pursued the ideas of a learning machine, and the field of Machine Learning is now a quite matured subfield within AI. Machine learning is closely related to the fields of data mining^[37] and pattern classification.^[38]

A typical intelligent agent with learning capability could be modeled as consisting of a learning element, a knowledge base, and a performance element. The agent interacts with the outside environment by performing some tasks (by the performance element) in the environment, and getting experience through observing the environment and its feedbacks to the agent. The learning element of the agent learns useful knowledge from the experiences, such that the learned knowledge will enable the performance element to do better on the task in the future. For example, consider a computer program that learns to play the game of checkers. The performance element here is a component that plays the game by using an evaluation function f on board configuration features to choose the next move. The outside environment is another copy of the program itself, and the experience gained by the computer will be a sequence of games between the computer and its opponent, as well as the game outcomes (win, loss, or draw). The learning element of the system could be a least-mean square-based linear function learning algorithm, if we define the evaluation function f to be a linear function of the game board features. Arthur Samuel's Checkers program^[8] has tested such set-ups.

Machine learning tasks can be classified as supervised, unsupervised, and reinforcement learning dependent on the kind of experience available to the learning agent. In supervised learning, the task is learning (an approximation of) a function f from a set of input-output pairs for f : $\{x_1, f(x_1), \dots, x_m, f(x_m)\}$. Here the experience is encoded in the supervision: the function values at the points $x_1, \dots, x_m$. In the case of learning to classify Web pages as "interesting" or "uninteresting," the function value $f(x_i)$ for a Web page x_i will be just binary: 1 or 0 (denoting whether a Web page is interesting or uninteresting). In unsupervised learning, we do not have a beneficial teacher providing the labels ($f(x_i)$) for each observed x_i , we can only identify the patterns present in the observed data $\{x_1, \dots, x_m\}$. In some sense, unsupervised learning basically amounts to forming clusters from the data and thus identifying the inherent structures in the data. For reinforcement learning, the agent does get some feedbacks from the environment, but not in the form of direct supervision $f(x)$ for each observed instance x . Instead, the agent would perform a sequence of actions in the environment and then receive a "reinforcement" signal after performing the action sequence. For example, consider a robot exploring an open area with obstacles and trying to reach a specific goal location without bumping into the obstacles. Here we do not give specific supervisions as to what is the best move for each location—because such supervision may not be available anyway in practice. Instead, reinforcement signals could

be assigned to reward or punish a sequence of actions. If the robot reached the target location through several moves without bumping into obstacles, it would get a positive reward. It would get a negative reward (punishment) when stumping into an obstacle.

Symbolic learning approaches represent the knowledge to be learned in symbolic forms such as decision trees, formulas in propositional logic, logic programs, etc., and learning often takes place in some form of symbolic manipulation/inference, loosely speaking. One popular learning algorithm is Quinlan's Decision Tree learning algorithm,^[39] which constructs a decision tree from a set of training examples, in a top-down fashion. Each example is represented by a vector of attribute-value pairs, together with a class label for the example. In each step of the tree construction, the algorithm checks to see if the examples associated with the current node are of the same class. If so, the node is a leaf node, and marked by the class name. Otherwise, the algorithm chooses the "most discriminating attribute" A to subdivide the examples associated with the node into disjoint subsets, and thus growing the tree. Then the tree construction process is applied recursively until the resulting subsets are "pure," namely, consisting of examples from one class. Various works have been done on learning Boolean functions, learning decision lists, and learning logic programs.

Artificial Neural Networks (ANN)^[40,41] follow a different approach to the learning task. ANN research was motivated by the desire to construct simplified mathematical, computational models that mimic the way human brain works, and hoping to achieve better performance on tasks requiring human intelligence. It is observed that human brains consist of large number of biological neurons, which are massively connected, each with relatively low switching speed in communications compared with the switching speed of electronic circuits. However, humans can perform, with amazing speed, complex cognitive tasks such as recognizing a familiar face, which is still a difficult task for computers in spite of their speed advantages. This suggests that the processing power of the human brain may come from its highly parallel mode of information processing, and the connections patterns among the neurons are crucial in making such massively parallel processing possible. The study of ANN models represents efforts in trying to simulate this model of human brains. An ANN consists of a number of simple processing units, called neurons, each capable of computing simple functions such as linear functions and threshold functions, and sigmoid functions. The neurons are interconnected with real-valued weights. Neural networks can be used to do predictions, to perform classification tasks, to approximate functions, and to find clusters in input datasets. Learning in ANN amounts to adjusting the numerical-valued weights that connect the neurons. Such learning could be supervised, unsupervised, or a hybrid of supervised and unsupervised. In the supervised learning,

perhaps the most well-known learning algorithms are perceptron training algorithm for a single linear threshold unit, and the backpropagation algorithm for training multilayer feedforward networks. Neural networks have been used widely in many successful applications.

Genetic Algorithms (GA)^[42] are another distinctive family of methods for learning. GA are search algorithms that patterned after natural evolution. In using GA for learning, we are interested in searching for good solutions for a problem by selecting candidate solutions and recombining parts of candidate solutions guided by the mechanics of natural selection (survival of the fittest) and natural genetics (children inherit good traits from parents, with occasional mutations). GA maintains a current population of strings, each encoding a candidate solution to the problem. A fitness function f is defined that measures the merit of a string as a solution to the problem. The objective of GA is to search for the best string which maximizes the fitness value. GA applies the genetic operators reproduction, crossover, mutation to the current population in generating the next population of candidate solutions. In the reproduction process, strings from the current population are sampled with probabilities proportional to their fitness values. Crossover operations will produce two new strings from two parent strings by exchanging segments of the parents. And finally mutations may be applied to randomly alter one bit in a string. Through evolutions of strings from one generation to the next, GA perform structured yet randomized search of the space of all possible strings, often efficiently, in looking for the optimal or near optimal solutions. Koza's genetic programming^[43] further extends the idea of GA by evolving computer programs for problem solving. GA research is closely related to studies of Artificial Life and evolutionary computing.

Another type of machine learning is statistical learning,^[44] utilizing probabilities and Bayesian theories for learning. In particular, graphical models aim at generating models represented as directed or undirected graphs with (conditional) probability tables attached to each node in the graph, and the entire graph captures joint distributions of a set of random variables. This includes learning Bayes Belief Networks,^[45] learning (conditional) Markov Networks, etc. In recent years Probabilistic Relational Models (PRM) and related learning models have also been developed.

Natural Language and Speech Processing

An intelligent system must have the capability to communicate and interact effectively with the outside world. Effective communications include receiving information (in various forms) from the world, understanding such information, and sending out information in suitable forms understandable to the outside world. Natural language processing and speech processing address the problems involved for an intelligent computer to communicate with

humans using natural (written or spoken) language such as English.

Natural language processing^[46] research mainly handles the task of communicating with written natural language. The main topics studied include language understanding, language generation, and machine translation. The inputs to a natural language understanding system are written texts (articles, or paragraphs or sentences) of some language, and the desired outputs are semantical structures represented in some form, which capture the semantic meanings of the inputs. Language generation handles the opposite side of the problem: Given semantic meanings to be communicated to the outside world, a natural language generator produces correct natural language sentences (paragraphs, articles) that convey the meanings accurately. Machine translation tackles the task of automated translating texts from the source language to the target language, say, from English to French.

In speech processing,^[47] the tasks are speech understanding and speech generation. Clearly, the apparatus of natural language processing techniques can be used as components of a speech processing system. For speech understanding, the main hurdle is speech recognition, which requires the capability of converting the spoken language inputs into written texts (so that natural language understanding tools can be utilized subsequently). Similarly, for speech generation, the major task is to map written texts to speech utterance. Converting continuous speech signals to written text requires multiple steps, from the initial step of signal sequence segmentation, to the step of phoneme recognition, followed by the step of mapping phonemes to texts. Signal processing techniques are needed to handle speech signal noise removal and segmentation. Neural Networks and Hidden Markov Models are commonly used techniques for speech recognition and generation.^[48] Speech recognition and generation techniques^[49] are widely used in day to day applications such as automated information systems in airlines, banks, etc.

Natural language processing requires several important techniques. First, syntactical analysis tools such as parsers are necessary for analyzing the syntactical structures of sentences according to the language grammar—to find the subject, predicate, and the object in a sentence. Semantical analysis tools are needed to give semantic interpretation to the sentences. Contextual information and pragmatic background knowledge are also essential for semantic disambiguation (word meaning disambiguation, reference resolution, etc.). Thus knowledge representation is also an important topic related to natural language processing.

Natural language processing is closely related to text-mining, which is an active area of study involving computer science and LIS. Text-mining aims to discover useful knowledge from large collections of textual documents, which can be seen as a generalization of natural language understanding. The studies in text-mining

include text summarization, concept extraction, and ontology extraction.

Signal, Image Processing, and Robotics

The communications between an intelligent agent and the outside world can take various forms, such as visual and audio signals, in addition to utterances in natural language. Moreover an intelligent agent should be able to act in the world and thus effecting changes to the world around it as well. Signal and image processing research develops techniques that support computer perception and understanding of information in image, audio, and other sensory forms (such as radio signals, infrared, GPS signals). Robotics put together the techniques of AI study and build robots that can act intelligently, change the world, and achieve desired goals.

Although signal processing has been mostly studied by researchers in Electrical Engineering (EE), it has close connection to building fully autonomous intelligent agents. Image processing^[50] and computer vision^[51] are important topics in AI and EE. In image processing, the main task is image understanding, namely, to build a semantic model of a given imagery; and in computer vision, the main task is visual scene understanding, i.e., to building a model of the world (the perceived visual scene). Further extension of visual scene understanding would include understanding video streams (sequence of scenes). The “understanding” of a visual scene/image involves recognition of the objects present, the relevant photometry/geometry features of the objects, and the (spatial or other) relationships among the objects. To achieve the objectives of image/scene understanding, several stages of image processing operations are needed. Initial processing of images includes low-level operations such as smoothing to filter out noise in the image signals, edge detection, and image segmentation to decompose the image into groups with similar characteristics. These low-level processing operations are local computations and require no prior knowledge about the images for the particular application. The next stage processing involves object recognition, which requires isolating each distinctive object, determining the object’s position and orientation (relative to the observer), and identifying the object shape. Objects are outlined by edges and described by a set of features, which are chosen by the designer of the image processing system. The feature could be shape-based (geometric features) or photometric features (such as textures, brightness, shading). For this processing stage, the computations are not necessarily local, features for characterizing different objects could require computation involving the pixels of the entire image. Supervised learning or pattern classification^[38] methods are typically used for object recognition. The problem of object recognition from images is still highly challenging: a good object recognition system must perform well in spite of variations in the input image. The variations include changing

illumination of the image, different pose and orientation of the objects, and translation, scaling of the objects. We humans are very good at recognizing, for example, familiar faces even if the faces are varied by wearing eye glasses, putting on a hat, having a different facial expression, or being illuminated differently. But such variations are still very hard to handle by computers.

Robotics^[52] studies the techniques for building robots, i.e., intelligent agents with capabilities to act in the physical world. The research in Robotics concerns with both the hardware and software aspects of robots. A robot possessed a set of sensors for perceiving its surrounding environment and a set of effectors (also called actuators) for effecting actions in the environment. For example, for a mobile robot such as the planetary rovers that explore the surface of Mars, it has range sensors for measuring distance to close-by obstacles and image sensors (cameras) for getting images of surrounding environment. It also has effectors such as wheels/legs, joints for moving around. Robots can be classified into three categories: (1) Manipulators, which are robotic arms physically anchored at a fixed location, for example, garbage collection robot arms on the garbage van; (2) Mobile robots that move around using wheels, legs, etc.; and (3) Hybrid—mobile robots with manipulators. In particular, recent years have witnessed an increasing interest in building the so-called humanoid robots which, resemble humans in physical design and physical appearance.

The research problems studied in robotics call for utilization of all major AI techniques. A robot must be able to perceive its environment and represent the state of its environment in some knowledge representation form, it must be able to learn from its past experiences, it must be able to perform inference in making decisions about the correct move, and it must be able to plan and act intelligently, it must be able to handle uncertainty, and it must be able to communicate effectively to teammates and human users. Robotic perception addresses the problem of constructing internal models/representations of the environment from the sensory signals of the robot. This includes the study on localization, i.e., locating the position of specific objects, on environment mapping which allows the robot to construct a map of its environment by observation and exploration. Robotic motion research concerns with the planning and control of robot moves by the effectors. Various control architectures have been proposed in the literature.

Robotics has found wide range of successful applications in the real world. We will present some in the next entry on AI applications.

AI APPLICATIONS

AI has found many successful applications in various sectors of the real world. Here we sample some of them. The online resource from Wikipedia^[53] gives more samples.

Game playing. Since early days of AI, researchers have studied the problem of computer game playing using heuristic search methods and machine learning. Arthur Samuel's Checkers playing program pioneered the studied in this aspect. Along with the advances in computing power and AI research, many successful computer game playing systems have been developed that can compete at human master levels. TD-Gammon^[54] is a neural network based program that plays the game of Backgammon very well. The most well-known computer game player is perhaps the Deep Blue^[9] Chess program from IBM. In a 6-game match against world Chess champion Kasparov, Deep Blue achieved 2 wins, 3 draws, and 1 loss, thus overall it has won the match. Today there are many online computer game playing programs (chess, go, checkers, backgammon, etc.) that people can play with and have fun. Almost all such game programs utilize ideas from AI in one way or the other.

Financial applications. Prominent financial firms in Wall Street have employed proprietary software systems for predicting stock-market trends and predicting stock prices for assisting mutual fund managers to boost investment returns. Although the details of such proprietary systems are held secret, it is known that at least a number of them used neural networks.

Medicine and health care. In more than 100 hospitals across the United States, nurses receive help from robotic "tugs"^[55] that tow carts that deliver everything from meals to linens. Miniature robots have been used in surgery procedures for a number of diseases.^[56] Data mining and machine learning techniques have been applied to find patterns of diseases and treatment effects of various medications from huge amounts of medical data. Intelligent medical imaging tools have been widely used to identify tumors/nodules from x-ray/CT-scan images for early detection and diagnosis of cancers. Moreover, computational biology combined with microarray technology in biological sciences has enabled the medical scientists to quickly identify or pin-point the genes responsible for certain diseases.^[57] The construction of large online medical knowledge bases and the availability of such medical knowledge to ordinary people contribute significantly to boost preventive care in public health.

Engineering and manufacturing applications. The ideas of heuristic search and GA have been widely used in solving optimization problems commonly seen in engineering applications such as job-shop scheduling and air traffic scheduling. In manufacturing, utilization of robotic arms at assembly lines is quite common, and such application enhances the productivity tremendously.

Environment protection. Remote-sensing techniques have been widely used for gathering information about the oceans, the atmosphere, the space, and the earth. It is a difficult task to process the huge amount of environment data and find trends in environment change so as to meet the challenge of climate change and global warming. AI

methods such as image processing, pattern classification, and data clustering have been applied successfully for analyzing environment data to assist scientists in environment-related research.^[58]

Space science explorations. Mobil robots have been used to explore the unknown terrains on Mars. According to the Mars rover's web page,^[59]

NASA's twin robot geologists, the Mars Exploration Rovers, launched toward Mars on June 10 and July 7, 2003, in search of answers about the history of water on Mars. They landed on Mars January 3 and January 24 PST, 2004 (January 4 and January 25 UTC, 2004). The Mars Exploration Rover mission is part of NASA's Mars Exploration Program, a long-term effort of robotic exploration of the red planet.

After more than four years of geological surveying the Mars Exploration Rovers robots have ceased to communicate (November 11, 2008).

Intelligent information systems. AI research has significantly impacted the studies in LISs. Ideas in AI have been widely applied in information technology to build smart information systems. On the other hand, the explosive development of the Internet and the Web has fueled AI with many interesting and challenging research problems. Along with the challenges are the great opportunities to bring AI closer to ordinary people's day-to-day lives. Nowadays we take it for granted that we can find information about anything by using online search engines such as Google, Yahoo, or Microsoft Live. Millions of consumers utilize online shopping tools to buy services and products. Digital libraries are a commonplace accessible to a much larger audience than before. What people probably did not realize is that behind all these nice and fascinating online tools and services (such as search engine, online shopping tools, etc.) there are important contributions of AI. For example, association rule mining and other AI methods are routinely used in many major online shopping Web sites so that related products can be recommended to consumers.

Intelligent information systems studies have developed a number of AI-based approaches in information extraction, indexing, and smart information retrieval. In information extraction, text-mining and natural language processing methods are developed to obtain semantical information from texts in the form of concepts and their relationships. Such information is then used for indexing the source texts to facilitate retrieval.^[60] User profiles can be constructed by fuzzy clustering on user information-seeking behaviors (Web-click streams, etc.) to personalize the information service to individual users.^[61] User information-seeking behavior includes not only current session Web-click streams of the user, but also previously logged Web search activities that help to model the user. Fuzzy rule, Neural Networks, and GA have been applied to adapt user queries for better retrieval performance.

There are continuous efforts in building large-scale commonsense knowledge bases and making information/knowledge in the collection accessible to ordinary people. The Wikipedia is one of such knowledge bases.^[62] On the other hand, the studies in Semantic Web^[32] aims at building large knowledge bases in formats such that the semantics (contents) of the information can be interpreted and processed by computers across the Web. Clearly Semantic Web would promote knowledge sharing and intelligent query-answering beyond what the current Web search engines would support. Along this line, the CYC project is another notable example.^[63]

Many multimedia information retrieval systems have been constructed, resulting in various interesting applications such as music retrieval system,^[64] video-clip retrieval system,^[65] etc. Image retrieval for security surveillance has been in practical use for quite some time.

Machine translation. Machine translation is one special type of intelligent information system service, which supports automatic translation of texts from a source language to a target language. Today one can use machine translators at various online search engines, for example, Google. Although the performance is still not as good as that of human translators, machine translators are very useful in several ways. For one thing, human translators are highly specialized professionals and thus expensive to hire. Secondly, human translators would get tired and could not work as fast as computers. The common practice in using machine translation is to let the machines do the first (quick) cut of the translation and then let human translators polish the results produced by machines. This would greatly enhance the productivity of translation.

CONCLUSIONS

AI is an exciting research area. AI research is multidisciplinary in nature, drawing on advances in mathematics, philosophy, logic, computer science, information theory, control, cognitive science, and linguistics. The objective of AI is to understand the nature of intelligence and to build computer systems that behave intelligently. AI research covers a wide range of topics, many of which are briefly discussed in this entry. AI has found many successful applications that impact our daily life significantly. The entry samples some AI applications. AI and LISs have close connections, and cross-fertilization of research efforts between the two fields has been fruitful. Looking forward, we see great opportunities as well as challenges in realizing the dream of AI, which we embrace wholeheartedly.

Artificial Neural Networks and Natural Language Processing

Hermann Moisl

Center for Research in Linguistics, University of Newcastle upon Tyne, Newcastle upon Tyne, U.K.

Abstract

This entry gives an overview of work to date on natural language processing (NLP) using artificial neural networks (ANN). It is in three main parts: the first gives a brief introduction to ANNs, the second outlines some of the main issues in ANN-based NLP, and the third surveys specific application areas. Each part cites a representative selection of research literature that itself contains pointers to further reading.

INTRODUCTION

Two preliminary notes:

- NLP is here regarded as language engineering—i.e., the design and implementation of physical devices that process human linguistic input in some application and not as cognitive modeling.
- The discussion is concerned solely with text. This is not meant to imply that speech processing is any sense less important in NLP than text processing—far from it. It is, rather, simply a consequence of space limits on this entry, which preclude consideration of what has become a research discipline in its own right.

ARTIFICIAL NEURAL NETWORKS

An ANN is an artificial device that emulates the physical structure and dynamics of biological brains. There are two broad approaches to such emulation. One approach regards ANNs as biological models that capture aspects of brain structure and dynamics as accurately as possible. The other sees ANNs as computational systems, which, although neurally inspired, can be developed in line with required computational properties without regard to biology. Historically, these two approaches have proceeded more or less independently, but recently, with rapid advances in brain-imaging techniques and consequent improved understanding of the brain, there are clear signs of convergence. This discussion focuses on ANNs as computational systems.

ANNs were first proposed by McCulloch and Pitts^[1] in 1943 and were developed throughout the 1950s and 1960s.^[2,3] But, in 1969, Minsky and Papert^[4] showed that there were computable functions that the ANN architectures of the time could not compute,^[5] as a consequence of which ANN-based research activity diminished significantly. Some researchers persevered, however, and by the

early 1980s interest in them had begun to revive.^[6] In 1986, Rumelhart and McClelland published their now-classic *Parallel Distributed Processing*^[7] volumes. Among other things, these proposed the backpropagation learning algorithm, which made it possible to train multi-layer nets and thereby to overcome the computational limitations that Minsky and Papert had demonstrated. The effect was immediate. An explosion of interest in ANNs ensued, which continues today. This has generated a considerable variety of network architectures; details are available from numerous textbooks.^[8–10]

ISSUES IN ANN-BASED NLP

Motivation

In general, a new technology is adopted by a research community when it offers substantial advantages over what is currently available. NLP has from the outset been dominated by a technology based on explicit design of algorithms for computing functions of interest and implementation of those algorithms using serial computers, an approach widely known as “symbolic NLP.” It is only since the early 1980s that alternative technologies have been extensively used, among them ANNs. In what follows, we look briefly at the main advantages and disadvantages of ANNs relative to symbolic NLP.

Advantages

Of the various advantages referred to in the literature, the following two are arguably the most important:

- **Function Approximation**
It has been shown that certain ANN architectures, including widely used ones, can approximate any computable function arbitrarily closely.^[11–14] The function f which a given ANN approximates is determined by

its parameter values, or weights, and these parameter values are learned from a data set $D \subset f$. In principle, therefore, NLP functions can be approximated from data using ANNs, thereby bypassing the explicit design of algorithms for computing those functions.

Why should one want to dispense with explicit design? Looking back on several decades' work on symbolic NLP, and artificial intelligence (AI) more generally, some researchers have come to believe that a variety of problems are too difficult to be solved by algorithm design given the current state of software technology^[15] and have instead turned to function approximation techniques like ANNs. A, and probably the, chief advantage of ANN technology for NLP, therefore, is that it offers an alternative way of implementing NLP functions which symbolic NLP has thus far found it difficult to implement.

- Noise Tolerance

Practical NLP systems must operate in real-world environments characterized by noise, which can for present purposes be taken as the presence of probabilistic errors in the data (e.g., spelling or syntax errors). A frequent criticism of symbolic AI/NLP systems is that they are brittle in the sense that noisy input, which the designer has not taken into account, can cause a degree of malfunction out of all proportion to the severity of the input corruption. The standard claim is that ANNs are far less brittle, so that the performance of an ANN-based system will “degrade gracefully” in some reasonable proportion to the degree of corruption.

Noise tolerance is a by-product of ANN function approximation. ANNs approximate a function from data by fitting a regression curve to data points, and the best approximation—the one which generalizes best—is not the curve that passes through the data points, but the one that best captures the general shape of the data distribution.^[16,17] Most of the data points in a noisy environment will be at some distance from the regression curve; if the input corruption is not too severe, the regression model will place the corresponding output in or near the training data distribution.

Disadvantages

Scaling. Given some ANN architecture, the aim of learning is to find a set of connection strengths that will allow the net to compute a function of interest. Empirical results have repeatedly shown that the time required to train an ANN increases rapidly with the number of network connections, or network complexity, and fairly quickly becomes impractically long. The question of how ANN learning scales with network complexity is therefore crucial to the development of large nets for real-world

applications. The answer is that learning is an NP complete or intractable problem—“We cannot hope to build connectionist networks that will reliably learn simple supervised learning tasks.”^[18]

This result appears to bode ill for prospects of scaling ANNs to large, real-world applications. It is all very well to know that, in theory, ANNs with suitable architectures and sufficient complexity can implement any computable function, but this is of little help if it takes impractically long to train them. The situation is not nearly as bad as it seems, however. The intractability result is maximally general in that it holds for all data sets and all ANN architectures. Although theoretically interesting, such generality is unnecessary in practice^[19] and a variety of measures exist, which constrain the learning problem such that intractability is either delayed or circumvented. These include restricting the range of ANN architectures used,^[19] developing mechanisms for determining optimal network complexity for any given learning problem such as network growing and pruning algorithms,^[18] biasing the net toward data to be learned,^[20,21] explicit compilation of knowledge into network weights,^[22] preprocessing of inputs by feature extraction, where the features extracted reflect the designer's knowledge of their importance relative to the problem,^[16] incremental training,^[20] and transfer of weights from a net that has successfully learned a problem similar to the one of interest.^[23,24]

Inscrutability. A network that has learned its training data and generalizes well realizes a desired behavior, but it is not immediately obvious how it does so; the set of connection strengths determine the behavior, but direct examination of them does not tell one very much. Because of this, ANNs acquired a reputation as “black box” solutions soon after their resurgence in the early to mid-1980s and have consequently been viewed with some suspicion, particularly in critical application areas like medical diagnosis expert systems where unpredictable behavior, or even the possibility of unpredictable behavior, is unacceptable. ANNs are, however, no longer the black boxes they used to be. Mathematical tools for understanding them have been developed,^[13,14] and inscrutability has become less of a disadvantage in the application of ANNs.

Discussion

It needs to be stressed that the intention here is not to argue that ANN-based NLP is necessarily “better” than its symbolic counterpart in a partisan sense. They are alternative technologies, each with its strengths and weaknesses, and, in an NLP context, can be used pragmatically in line with one's aims. The current position with respect to NLP is that ANN-based systems, “while becoming ever more powerful and sophisticated, have not yet been able to provide equivalent (let alone alternative superior) capabilities to those exhibited by symbolic systems.”^[25]

ANN-Based NLP

NLP is historically intertwined with several other language-oriented disciplines, including cognitive science, AI, generative linguistics, and computational linguistics. In general, the interaction of these disciplines has been and continues to be important. It remains, however, that each discipline has its own research agenda and methodology, and it is possible to waste time engaging with issues that are simply irrelevant to NLP. Now, it happens that ANN-based research into natural language has been strongly cognitive science oriented. For present purposes, it is important to be clear about the significance of this for NLP.

The formalisms invented in the 1930s and 1940s to define computable functions were soon applied to modeling of aspects of human intelligence including, of course, language. There have been two main strands of development. One is based on automata and formal language theory and has come to be known as the “symbolic” paradigm. The other is based on ANNs and is known as the “connectionist” or “subsymbolic” paradigm. Until fairly recently, the symbolic paradigm dominated thinking about natural language in linguistics, cognitive science, and AI. It reached its apotheosis in the late 1970s, when Newell and Simon^[26] proposed the Physical Symbol System Hypothesis (PSSH), in which “physical symbol system” is understood as a physical implementation of a mathematically stated effective procedure, the prime example of which is the Turing Machine. The PSSH was widely accepted as the agenda for future work in linguistics, cognitive science, and AI: in essence, the first two proposed cognitive virtual architectures, and the third implemented them. At this time, however, interest in ANNs was being revived by cognitive scientists who saw them as an alternative to the dominant symbolic paradigm in cognitive modeling, and a debate soon arose on the relative merits of the PSSH- and ANN-based approaches to cognitive modeling. The PSSH case was first put in 1988 by Fodor and Pylyshyn,^[27] who labeled what we are here calling the symbolic as the “classical” position, and Smolensky^[28] argued the ANN-based case;^[29–32] between them they set the parameters for subsequent discussion.^[33–43] The essentials of the debate are as follows.

The symbolist position (all quotations are from Fodor and Pylyshyn)^[27] descends directly from the PSSH and thus proposes cognitive architectures, which compute by algorithmic manipulation of symbol structures; the mind is taken to be a symbol manipulation machine. Specifically, there are representational primitives—symbols. Being representational, symbols have semantic content (i.e., each symbol denotes some aspect of the world). A representational state consists of one or more symbols, each with an associated semantics,

in which 1) there is a distinction between structurally atomic and structurally molecular representations, 2)

structurally molecular representations have syntactic constituents that are themselves either structurally molecular or structurally atomic, and 3) the semantic content of a representation is a function of the semantic contents of its syntactic parts, together with the syntactic structure.

Transformations of mental states “are defined over the structural properties of mental representations. Because these have combinatorial structure, mental processes apply to them by virtue of their form.” Therefore,

if in principle syntactic relations can be made to parallel semantic relations, and if in principle you have a mechanism whose operation on expressions are sensitive to syntax, then it is in principle possible to construct a syntactically driven machine whose state transitions satisfy semantic criteria of coherence. The idea that the brain is such a machine is the foundational hypothesis of classical cognitive science.

The subsymbolic position (all quotations are from Fodor and McLaughlin)^[28] defines cognitive models that are “massively parallel computational systems that are a kind of dynamical system.” The primitives are subsymbols, which are like classical symbols in being representational, but unlike them in being finer-grained: they “correspond to constituents of the symbols used in the symbolic paradigm..Entities that are typically represented in the symbolic paradigm as symbols are typically represented in the subsymbolic paradigm as a large number of subsymbols.” The difference between symbolic and subsymbolic models lies in the nature of the semantic content. The subsymbolic position distinguishes two semantic levels, the conceptual and the subconceptual: “The conceptual level is populated by consciously accessible concepts, whereas the subconceptual one is comprised of finer-grained entities beneath the level of conscious concepts.” In classical models, symbols typically have conceptual semantics (i.e., semantics, which correspond directly to the concepts that the modeler uses to analyze the task domain, whereas subsymbols in subsymbolic models have subconceptual semantics; the semantic content of a subsymbol in a subsymbolic ANN model corresponds directly to the activity level of a single processing unit in an ANN. Subsymbolic representations are, moreover, not operated on by processes, which manipulate symbol structures in a way that is sensitive to their combinatorial form because subsymbolic representations do not have combinatorial form. Instead, they are operated on by numeric computation. Specifically, a subsymbolic ANN model is a dynamical system whose state is a numerical vector of the activation values of the units comprising the net at any instant t . The evolution of the state vector is determined by the interaction of the current input, the current state of the system at t , and a set of numerical parameters corresponding to the relative strengths of the connections among units.

How do the symbolic and subsymbolic paradigms relate to one another as cognitive models? In the symbolist view,

classical and connectionist [=subsymbolic] theories disagree about the nature of mental representations. For the former but not the latter, representations characteristically exhibit combinatorial constituent structure and combinatorial semantics. Classical and connectionist theories also disagree about the nature of mental processes: for the former but not the latter, mental processes are characteristically sensitive to the combinatorial structure of the representations on which they operate. These two issues define the dispute about the nature of cognitive architecture.

Now, any adequate cognitive model must explain the productivity and systematicity^[44–46] of cognitive capacities. Symbolic models appeal to the combinatorial structure of mental representations to do this, but subsymbolists cannot: “Because it acknowledges neither syntactic nor semantic structure in mental representations, it treats cognitive states not as a generated set but as a list,” and among other things lists lack explanatory utility. Because they cannot explain cognitive productivity and systematicity, subsymbolic models are inadequate as cognitive models; they may be useful as implementations of symbolically defined cognitive architectures, but this has no implications for cognitive science.

In the subsymbolist view, on the other hand, subsymbolic models refine symbolic ones rather than, as the symbolists maintain, implementing them. In a now-famous analogy, the relationship between symbolic and subsymbolic paradigms is likened to that which is obtained between the macrophysics of Newtonian mechanics and the microphysics of quantum theory. Newtonian mechanics is not literally instantiated in the world according to the microtheory, because fundamental elements in the ontology of the macrotheory, such as rigid bodies, cannot literally exist according to the microtheory. In short, “in a strictly literal sense, if the microtheory is right, then the macrotheory is wrong.” This does not, however, mean that Newtonian mechanics has to be eliminated, for it has an explanatory capacity, which is crucial in a range of sciences and branches of engineering and which a (strictly correct) quantum mechanical account lacks; such explanatory capacity is crucial in the subsymbolic view. Thus, cognitive systems “are explained in the symbolic paradigm as approximate higher-level regularities that emerge from quantitative laws operating on a more fundamental level”—the subconceptual—“with different semantics.” Or, put another way, symbolic models are competence models that idealize aspects of physical system behavior, whereas subsymbolic models are performance models that attempt to describe physical systems as accurately as possible.

What are the implications of this debate for ANN-based NLP? First, the debate has forced a reexamination

of fundamental ideas in cognitive science and AI, and, because much of the ANN-based research on NL is done within a cognitive science framework, ANN-based NLP cannot afford to ignore developments in the corresponding cognitive science work. This is not bland ecumenism, but a simple fact of life.

Second, notwithstanding what has just been said, it remains that the cognitive science focus of the debate can easily mislead the NLP researcher who is considering ANNs as a possible technology and wants to assess their suitability. The debate centers on the nature of cognitive theories and on the appropriateness of symbolist and subsymbolist paradigms for articulation of such theories. These issues, although intrinsically interesting, are orthogonal to the concerns of NLP as understood here. Cognitive science is concerned with scientific explanation of human cognition, including the language faculty, whereas NLP construed as language engineering has no commitment to explanation of any aspect of human cognition, and NLP systems have no necessary interpretation as cognitive models. The symbolist argument that the ANN paradigm is inadequate in principle for framing cognitive theories is, therefore, irrelevant to NLP, as are criticisms of particular ANN language-processing architectures in the literature on the grounds that they are “cognitively implausible,” or fail to “capture generalizations,” or do not accord with psycholinguistic data.

Third, once the need for cognitive explanation is factored out, the debate reduces to a comparison of standard automata theory and ANNs as computational technologies.^[38] So construed, the relationship is straightforward. We have taken the aim of NLP to be design and construction of physical devices that have specific behaviors in response to text input. For design purposes, the stimulus-response behavior of any required device can be described as a mathematical function (i.e., as a mapping from an input to an output set). Moreover, because the stimulus-response behavior of any physical device is necessarily finite, the corresponding input-output sets can also be finite, with the consequence that every NLP function is computable; in fact, the sizes of the I/O sets are specifiable by the designer and can, therefore, be defined in such a way as to make the function not only finite and therefore theoretically computable but also computationally tractable. As such, for any NLP mapping, there will be a Turing Machine—a PSS—which computes it. But we have seen that certain classes of ANN are Turing equivalent, so there is no theoretical computability basis for a choice between the two technologies. The choice hinges, rather, on practical considerations such as ease of applicability to the problem in hand, processing efficiency, noise and damage tolerance, and so on.

And, finally, the debate has set the agenda for ANN-based language-oriented research in two major respects: the paradigm within the research is conducted, and the ability of ANNs to represent compositional structure. These are discussed in the following sections.

Research paradigms

The symbolist/subsymbolist debate has resulted in a trifurcation of ANN-based natural language oriented research, based on the perceived relationship between PSSH- and ANN-based cognitive science and AI:

- The symbolic paradigm^[47,48] accepts the symbolist view of the position of ANNs relative to cognitive science. It regards ANNs as an implementation technology for explicitly specified PSS virtual machines and studies ways in which such implementation can be accomplished.
- The subsymbolic paradigm^[49–51] subdivides into what is sometimes called “radical connectionism,” which assumes no prior PSSH analysis of the problem domain but relies on inference of the appropriate processing dynamics from data, and a position which in essence regards prior PSSH analysis of the problem domain as a guide to system design and/or as an approximate or competence description of the behavior of the implemented system. *Neural Networks and a New Artificial Intelligence*^[42] exemplifies the radical position, and Smolensky, in a manner of speaking the father of subsymbolism, has in various of his writings^[28,52–54] taken the second.
- The hybrid paradigm,^[38,55–60] as its name indicates, is a combination of the symbolic and the subsymbolic. It uses symbolic and subsymbolic modules as components in systems opportunistically, according to what works best for any given purpose. A subsymbolic module might, for example, be used as a preprocessor able to respond resiliently to noisy input, whereas the data structures and control processes are conventional PSS designs.

Interest in the hybrid paradigm has grown rapidly in recent years, and, to judge by relative volumes of research literature, it is now the most often used of the above three alternatives in engineering-oriented applications like NLP. It is not hard to see why this should be so. The hybrid paradigm makes full use of theoretical results and practical techniques developed over several decades of PSSH-based AI and NLP work and supplements it with the function approximation and noise resistance advantages of ANNs where appropriate. By contrast, the symbolic and subsymbolic paradigms are in competition with established PSSH-based theory and/or methodology. On the one hand, the symbolic paradigm has yet to demonstrate that it will ever be superior to conventional computer technology as an implementation medium for PSS virtual machines. On the other, the subsymbolic paradigm essentially disregards existing PSSH-based NLP theory and practice and starts afresh. Of the three paradigms, therefore, it is the least likely to generate commercially exploitable systems in the near future, although it is the most intriguing in pure research terms.

Representation

The most fundamental requirement of any NLP system is that it be able to represent the ontology of the problem domain.^[61–63] One might, for example, want to map words to meanings or strings to structural descriptions: words, meanings, strings, and structures have to be represented in such a way that the system can operate on them to implement the required mapping. Most ANN-based NL work has been directly or indirectly concerned with this issue, and this section deals with it in outline.

There are two fundamentally different approaches to ANN-based representation:

- Local representation: Given some set E of objects to be represented and a set N of network units available for representational use, a local representation scheme (or “local scheme” for short) allocates a unique unit or group of units $\in N$ for each object $e \in E$.
- Distributed representation: Given the same sets E and N , a distributed representational scheme uses all the units $n \in N$ to represent each $e \in E$.

The difference is exemplified in the pair of representational schemes for the integers 0–7 shown in Fig. 1. In the local scheme, each bit represents a different integer, whereas in the distributed one all the bits are used to represent each integer, with a different pattern for each. Because, in the local scheme, each bit stands for one and only one integer, it can be appropriately labeled, but in the distributed scheme, no bit stands for anything on its own; no bit can be individually labeled, and each is interpretable only on relation to all the others.

Local and distributed schemes both have advantages.^[41,61,64,65] Much of the earlier work used localist representation, and although the balance has now shifted to the distributed approach, significant localist activity remains.^[47,66–69] In what follows, local and distributed approaches to representation of primitive objects and of compositional structure in ANNs are discussed separately.

	Local	Distrib
1	0000001	0000001
2	0000010	0000010
3	0000100	0000011
4	0001000	0000100
5	0010000	0000101
6	0100000	0000110
7	1000000	0000111

Fig. 1 Local and distributed representational schemes.

Local representation. *Representation of primitives.* Local representation of primitive objects is identical to that in the PSSH approach: in a PSS, each object to be represented is assigned a symbol, and in local ANN representation, each object is assigned a unit in the net.

Representation of structure. Local representation of primitive objects is straightforward, but representation of compositional structure is not. The difficulty emerges from the following example.^[70] Assume a standard AI blocks world consisting of red and blue triangles and squares. A localist ANN has to represent the possible combinations. One unit in the net is allocated to represent “red,” another for “blue,” another for “triangle,” and yet another for “square.” If one wants to represent “red triangle and blue square,” the obvious solution is to activate all four units. Now represent “blue triangle and red square” using the same procedure. How can the two representations be distinguished? The answer is that they cannot, because there is no way to represent the different color-to-shape bindings in the two cases. In other words, there is no way to represent constituency in a net like this. Localists have developed a variety of binding mechanisms to overcome this problem.^[25,64,70,71]

Distributed representation. *Representation of primitives.* In distributed ANNs, each primitive object is represented as a pattern of activity over some fixed-size group g of n units, or, abstractly, as a vector v of length n in which the value in any vector element v_i represents the activation of unit g_i , for $1 \leq i \leq n$. Such representation has significant advantages over the localist approach.^[17]

Representation of structure. The symbolist/subsymbolist debate made representation of compositional structure a major issue in ANN-based cognitive science on account of its explanatory capacity. The symbolists claimed that ANNs were incapable of representing structure, and for that reason dismissed them as inadequate for cognitive modeling. In response, adherents of ANN-based cognitive science have developed a variety of structure-representing mechanisms. But, as noted, NLP as construed here is not primarily interested in explanation, but in implementing mappings of interest, and many ANN architectures can implement any computable mapping without—as the symbolists observe—any recourse to compositional structure. Whatever its importance for cognitive science, therefore, is representation of compositional structure an issue for ANN-based NLP? The answer is that, in principle, compositional structure is not necessary for NLP, although it may be useful in practice. A discrete-time, continuous space dynamic system, such as a two-layer feedforward ANN with sigmoid activation function, may theoretically be capable of implementing any computable function, but, for some particular function, is finding the required weight parameters computationally tractable, and will network

complexity have reasonable space requirements? It may well turn out that compositional structure makes implementation of certain NLP functions easier or indeed tractable; the need for compositional structure in ANN-based NLP is an empirical matter, and for that reason researchers need to be aware of the structuring mechanisms developed by ANN-based cognitive science.

Using a distributed ANN to represent compositional structure is difficult because arbitrarily complex structures have to be represented with a fixed-size resource (i.e., over some specific group of units). To see this, assume that the primitive objects in a given domain are represented as feature vectors. An ANN that uses distributed representations by definition uses all the available units for each vector. There would be no difficulty about individually representing “man,” for example, or “horse.” But how would the net represent “man” and “horse” at the same time? Even more difficult is representation of relations, such as “man on horse.” The problem, therefore, has been to find ways of overcoming this difficulty.

The crucial insight came from van Gelder in 1990.^[72] He argued that distributed representations can be compositional but not necessarily in the sense intended within the PSSH paradigm. Van Gelder’s article has become very influential in ANN-based cognitive science generally; its importance for present purposes lies in the distributed compositional representation, which it proposes and which underlies several distributed ANN-based representational mechanisms. Space limitations preclude a detailed account of it here. Suffice it to say that, as an alternative to the concatenative compositional representation used by symbolic cognitive science, where the symbol tokens of an expression’s constituents are spatially present in the compositional expression, van Gelder proposes nonconcatenative representation, where this is not the case. The importance of such nonconcatenative representation is that it breaks the link between abstract complexity and spatial representation size: because it does not require constituent tokens to be physically present in an expression token, it becomes possible in principle to represent abstract constituency relations over a fixed-size resource. What is needed in ANN terms are “general, effective, and reliable procedures”^[80] to compose constituent tokens into and to decompose them from expression tokens represented over the representational units of the net. Several such nonconcatenative mechanisms have been proposed, chief among them tensor products,^[73,74] recursive auto associative memories (RAAM),^[75–78] and holographic reduced descriptions.^[79–81]

Sequential processing

Text processing is inherently sequential in the sense that word tokens arrive at the processor over time. ANN-based work on NL has addressed this sequentiality^[82,83] by using three main types of network architecture:

- Multilayer perceptrons

MLPs are a feedforward architecture in which time is not a parameter: they map inputs to outputs instantaneously. MLPs consequently appear to be inappropriate for sequential processing. Nevertheless, the earlier ANN-based NL work used them for this purpose by spatializing time. Given a set of symbol strings to be processed, the MLP is given an input layer large enough to accommodate the longest string in the set, as in Fig. 2. This was unwieldy both because, depending on the input encoding scheme, it could result in large nets that take a long time to train and because of the inherent variability in the length of NL strings. It is now rarely used.

- Time-delay neural networks

A time-delay neural network (TDNN) is an MLP whose input layer is a buffer k elements wide, as shown in Fig. 3. It processes input dynamically over time $t_0, t_1, \dots, t_n$ by updating the input buffer at each t_i and propagating the current input values through the net to generate an output. The problem here is buffer size. For example, any dependencies in a string whose lexical distance is greater than the buffer size will be lost. In the limiting case, a buffer size equal to the input string length reduces to an MLP. TDNNs have been successfully used for finite state machine induction and in NLP applications.^[84–86]

- Recurrent networks

Recurrent networks (RANN) use a fixed-size input layer to process strings dynamically. RANNs used for NL work are discrete-time, and input successive symbols in a string at time steps $t_0, t_1, \dots, t_n$, as in Fig. 4. The net's memory of sequential symbol ordering at any point in the input string is maintained in the current state, which is fed back at each time step.

RANNs are dynamic systems that can be understood in terms of standard automata theory. A RANN that is driven through a trajectory in continuous-state space by a sequence of input signals is interpretable as an automaton driven through a trajectory in discrete space by an input symbol string, and the response of that RANN to a set of signal sequences as an automaton that defines a string set. Moreover, if the dynamics of the RANN are learned from input-output data rather than explicitly compiled into the net, then the RANN can be taken to have inferred an automaton which defines some language L or, equivalently, to have inferred the corresponding grammar.

There has been a good deal of work on the use of RANNs for grammatical inference, both for formal and for natural languages, and using a variety of RANN architectures.^[82,87–100] The training of a Simple Recurrent Network (SRN) as a finite state acceptor is paradigmatic:

Fig. 2 A feedforward ANN for string processing.

Fig. 3 A TDNN for string processing.

Fig. 4 A RANN for string processing.

given a language L and a finite set T of pairs (a, b) , where a is a symbol string and b is a boolean which is true if $a \in L$ and false otherwise, train an SRN to approximate a finite state acceptor for L from a proper subset T' of T . The SRN, like various other RANN architectures used for grammatical inference, is a discrete-time, continuous-space dynamic system. To extract discrete computational states, the continuous ANN state space is partitioned into equivalence classes by using, for example, statistical clustering algorithms based on vector distance, and each cluster is interpreted as a single computational state. Any finite state machine extracted in this way is a possible computational interpretation of the RANN, but it is not unique, because the number of states extracted depends on the granularity of the continuous-space partitioning and on the partitioning algorithm used.

Meaning representation

There are some NLP applications, like document search, where the meaning of the text being processed is not an issue. In others, semantic interpretation of text is necessary but reasonably straightforward; an example would be an NL command interpreter for a database front end, where both the syntax of input strings and the semantic interpretations to which they are mapped are both well defined and severely restricted relative to normal linguistic usage. However, when one moves to AI-oriented applications, such as (more or less) unrestricted NL understanding systems, semantic interpretation becomes a difficult and still largely unresolved problem. ANNs do not provide an easy solution, but they do offer a promising alternative to existing PSSH-based approaches.

Meaning is variously understood by different disciplines and by researchers within them. It does, however, seem uncontroversial to say that meaning of NL linguistic expressions has to do with denotation of states of the world and that semantic interpretation is a mapping from strings to denotations. That, in any case, is what is assumed here. PSSH-based AI and NLP systems have implemented the mapping by constructing system-internal representations of some aspect of the world—the “domain of discourse”—and then relating input strings to the representation.^[101] How best to represent the world has become a research discipline in its own right—knowledge representation—and numerous formalisms exist. Some ANN-based work on semantic interpretation continues in the PSSH tradition in the sense that they use explicitly designed domain representations. Other work takes a radically different approach, however: input strings are mapped not to explicitly designed representations of the world, which, inevitably, reflect a designer’s analysis of what is significant in the task domain, but to representations that are learned from the world via transducers without designer intervention. At its most ambitious task, this line of research aims to embed NLP systems in robotic

agents that not only receive inputs from an environment via, say, visual, acoustic, and tactile transducers, but also interact with and change the environment by means of effectors. The aim is for such agents to develop internal world representations by integrating inputs and internal states via self-organization based on adaptive interaction with the environment: “Concepts are thus the ‘system’s own,’ and their meaning is no longer parasitic on the concepts of others (the system designer).”^[102] In particular, agents would learn to represent the meanings of words and expressions from their use in specific environment-interactive situations. Work on this is proceeding,^[42,43,102–112] although it must be said that, to keep experimental simulations tractable, the goal of real-world interaction is often reduced to explicitly designed microworlds reminiscent of ones like the famous SHRDLU in the PSSH tradition.

ANN-BASED NLP: AN OVERVIEW

ANN-based NL research^[17,25,113–115] began, fairly slowly, in the early 1980s with articles on implementing semantic networks in ANNs,^[116] visual word recognition,^[117–119] word sense disambiguation,^[120] anaphora resolution,^[121] and syntactic parsing.^[122–124] In 1986, Lehnert published an article^[125] on the implications of ANN technology for NLP, an indication that this early work had by then attracted the attention of mainstream work in the field. Also in 1986 the *Parallel Distributed Processing* volumes^[7] appeared, and these contained several chapters on language: McClelland and Kawamoto on case role assignment, McClelland on word recognition, and Rumelhart and McClelland on English past tense acquisition. All of these were to be influential, but the latter had an effect out of all proportion to the intrinsic importance of the linguistic issue it dealt with. Rumelhart and McClelland presented an ANN that learned English past-tense morphology from a training set of (past tense/present tense) verb form pairs, including both regular (“-ed”) and irregular formations. They regarded their net as a cognitive model of past tense morphology acquisition on the grounds that its learning dynamics were in close agreement with psycholinguistic data on past tense acquisition in children, and, because it was able to generalize the regular tense formation to previously unseen present tense forms after training, that it had learned was an aspect of English morphology. Crucially, though, the net did this without reference to any explicit or implicit PSS architecture. This was quickly perceived as a challenge by symbolist cognitive scientists and became a test case in the symbolist versus subsymbolist debate outlined above. Pinker and Prince^[126] made a long and detailed critique of the Rumelhart and McClelland model, in response to which the model was refined by a succession of researchers.^[51,127–132]

From an NLP point of view, the chief importance of Rumelhart and McClelland's work and its successive refinements is not in its validity as a cognitive model but in the impetus that it gave to ANN-based NL research. It made 1986 a watershed year in the sense that the number of language-oriented articles has increased dramatically since then: disregarding speech and phonology on account of this article's focus on text processing, there has been further work on a wide variety of topics, a representative selection of which follows:

General language acquisition: see also the above discussion of sequential processing.^[41,89,90,133–135]

Morphology: see also the above discussion of past tense formation.^[23,136,137]

Lexical category learning^[89,90]

Lexical semantics^[49,64,68,102–111,138–143]

Syntax and parsing^[41,49,89,90,115,144–154]

Sentence semantics^[49,155–159]

Metaphor interpretation^[160,161]

Text understanding^[49,162–164]

Language production^[49,50,140,165–168]

Dialog systems^[49,50]

Character recognition^[169–172]

Text classification^[173–176]

Data mining and text summarization^[177–181]

Text compression^[182]

Arts Literatures and Their Users

Lisl Zach

iSchool, Drexel University, Philadelphia, Pennsylvania, U.S.A.

Abstract

The various arts disciplines such as dance, painting, and sculpture are often considered to belong to the larger category of the humanities. User studies in the humanities have focused primarily on the needs of scholars and academic researchers. User studies in the arts have also investigated the information needs of practicing artists and others involved in arts-related activities. While these studies are often exploratory in nature, they do point out that the needs of practicing artists go well beyond the information services traditionally provided by academic libraries. With the advent of the World Wide Web, artists and other users of information about the arts have access to some of the greatest libraries and museum collections in the world without ever leaving their homes. However, retrieval of textual, image, and sound data still poses significant challenges for the user.

INTRODUCTION

Arts literatures, or works about the arts, are as broad a field of materials as the various topics they cover. Until recently, information about the arts would have been found predominantly by seeking out primary materials or by consulting books or journal articles. However, due in large measure to the advent of the World Wide Web, the wealth of digital information sources has increased dramatically. These sources have changed the ways in which people look for and interact with information about the arts.

While users of information about the arts range from children looking for material to include in school assignments to retirees looking for information about museums they plan to visit, the main focus of this entry will be on the users most closely involved with the arts—scholars working in the various disciplines of the arts and the creative artists themselves. These user groups have specialized information needs and have been the subject of several previous research studies. In addition to examining what we know about art scholars' and artists' use of information, this entry will also address some of the current issues in retrieving information in the arts.

DEFINITION OF THE ARTS

Aristotle was the first to make the distinction between the arts and the sciences—a distinction that has been preserved in the academic traditions of today. For Aristotle, the sciences were concerned with the natural world while the arts focused on the “artificial.” During the Middle Ages, the term “liberal arts” came to be applied to the academic fields of grammar, rhetoric, logic, arithmetic, geometry, music, and astronomy, while many of the disciplines that we now think of as comprising the arts (such as dance,

painting, and sculpture) were considered to have little or no intellectual value. In modern times, the arts are often regarded as a subcategory of the humanities—those disciplines that are concerned with the study of human culture compared to the more empirical disciplines of the natural and social sciences. Blazek and Aversa, for example, include the visual and performing arts in the list of fields covered by their definition of the humanities.^[1]

One definition of the arts is offered by the National Foundation on the Arts and the Humanities Act, which established the National Endowment for the Arts and the National Endowment for the Humanities in 1965. In it, “the arts” were decoupled from the humanities and defined to include, but not be limited to “music (instrumental and vocal), dance, drama, folk art, creative writing, architecture and allied fields, painting, sculpture, photography, graphic and craft arts, industrial design, costume and fashion design, motion pictures, television, radio, film, video, tape and sound recording, the arts related to the presentation, performance, execution, and exhibition of such major art forms, all those traditional arts practiced by the diverse peoples of this country. [sic] and the study and application of the arts to the human environment.” National Foundation on the Arts and the Humanities Act (20 U.S.C. 952(c)). See <http://www.arts.gov/about/Legislation/Legislation.pdf>.

ARTS OCCUPATIONS

According to data released by the National Endowment for the Arts' Office of Research and Analysis, more than 2.1 million U.S. workers have artist occupations as their primary jobs. This number represents more than 7% of the total workers in all professional occupations. In addition, more than 300,000 workers hold secondary jobs as artists.^[2]

Table 1 Artist occupations.

	Primary jobs	Secondary jobs	Self-employed (%)	Postsecondary education or training
Designers	803,000	55,000	27	Bachelor's or associate's degree
Architects	239,000	6,000	20	Bachelor's degree
Fine artists and animators	245,000	32,000	62	long-term on-the-job experience
Musicians and singers	223,000	96,000	41	long-term on-the-job experience
Writers and authors	185,000	33,000	68	Bachelor's degree
Photographers	158,000	37,000	69	long-term on-the-job experience
Producers and directors	129,000	13,000	30	degree plus work experience
Announcers	63,000	21,000	25	long-term on-the-job experience
Actors	55,000	5,000	17	long-term on-the-job experience
Dancers and choreographers	35,000	3,000	19	long-term on-the-job experience
Other entertainers and performers	29,000	3,000	n/a	not available

As shown in Table 1, almost half of the total number of primary jobs belong to designers (a term that covers commercial and industrial designers as well as window dressers) and architects; the remaining categories include fine artists (i.e., painters, sculptors, and illustrators) and animators, musicians and singers, writers and authors, photographers, producers and directors, announcers, actors, dancers and choreographers, and other entertainers and performers.

Approximately one-third of artists are self-employed. This percentage is highest among photographers, writers and authors, and fine artists and animators. With the exception of designers and architects, most artists rely on on-the-job experience rather than formal academic education or training. These characteristics support a popular image of artists as solitary, eccentric, and preoccupied with their own creative processes that originated in the sixteenth century and has persisted ever since.^[3] However, most artists today “live and work in the same mundane world of dollars and deadlines as their professional colleagues” (p. 344)^[4] and so have many information needs not associated with their creative processes.

The numbers shown in Table 1 do not include academics and scholars who teach or do research in these areas unless they are also practicing artists. According to the Bureau of Labor Statistics, there are 72,100 postsecondary teachers of art, drama, and music. Data extracted from the Bureau of Labor Statistics Occupational Statistics homepage: <http://www.bls.gov/oes/home.htm> for Standard Occupational Classification code 251121 on March 30, 2008. In addition, the arts world includes many professionals who are neither practicing artists nor academic scholars but who do have specific job-related information needs.^[5] The diversity of user groups in the arts and the variety of their information needs make a simple definition difficult, but the following review provides some insights into the characteristics of these users.

USER STUDIES IN THE ARTS

Users in the humanities have been studied systematically by researchers for over 30 years. Early projects to identify

information needs in the humanities were carried out by the Centre for Research on User Studies at the University of Sheffield;^[6,7] further descriptions of the information needs of humanities scholars appeared in the early 1980s with the publication of articles by Weintraub^[8] and Stone.^[9] While the Weintraub article focused primarily on the implications for library services, the Stone study identified certain characteristics of humanities scholars that have been confirmed repeatedly by subsequent research. These include the tendency to work alone, to browse extensively, and to rely heavily on primary materials in addition to books and journals. Since the publication of the Stone study, researchers have discussed and expanded on the characteristics of humanities scholars^[10–14] and tracked changes in their information behavior in response to technology.^[15–18] A more thorough consideration of the humanities literatures and their users may be found elsewhere in this work, and it is not the intention of this entry to do more than indicate the context in which research on user groups in the arts has been conducted.

The overlap among the subject areas considered to be part of the humanities in general and those that are more strictly defined as belonging to the arts specifically is reflected in the studies of users in these areas. The distinction between the two areas is further complicated by the fact that often users of information about the arts are not themselves artists, but rather scholars such as art or music historians. These arts scholars may share more characteristics in common with other humanities scholars than with the visual or performing artists whose works they study. Furthermore, user studies point out that “scholars in the humanities do not have a homogeneous information-seeking behavior or homogeneous information needs” (p. 195).^[11] That this is also true of users in the arts becomes apparent when looking at studies of users in specific arts disciplines.

A further characteristic of user studies in the arts is that they, like the studies of users in the humanities, often take a library-centric perspective. That is, the focus of many studies has been on users' interactions with libraries and how library services might be better designed to serve these user groups' information needs.^[19–22] This perspective may not

fully reflect either the information needs or the information-seeking behavior of users in the arts, especially practicing artists. Users in the arts, whether scholars or practicing artists, often look beyond traditional academic library resources when searching for information or inspiration.

The concept of serendipity, and the role that it plays in the creative process, is addressed in several studies related to users in the arts.^[4,23] This concept is also well documented in studies of humanities and interdisciplinary scholars.^[24,25]

Art Historians

Among the earliest user studies specifically addressing a particular group in the arts was Stam's 1984 dissertation summarized in the article "How Art Historians Look for Information."^[26] Drawing on Allen's technology transfer model,^[27] Stam "attempted to establish some normative data about these scholars as a first step" towards providing better library and information services for these users.^[27] Stam's study found that art historians, like other humanities scholars, relied heavily on institutional and personal libraries. Art historians who were also college faculty augmented their personal libraries with a significant number of slides. Stam further found that art historians visited museums an average of eight times per year. This behavior was consistent with Stone's earlier finding on the range of materials needed by humanities scholars including "primary materials such as . . . works of art . . ." (p. 296).^[9] Stam's study also found that art historians working in museums used informal channels of communication (telephone calls, social/professional events, and correspondence) more frequently than did their counterparts working in academic environments. Both groups, however, interacted more with institutional colleagues than they did with librarians. Stam's conclusion from her data was that "information seeking among art historians seems to be a fairly private activity. . . . The process . . . appears to be a contemplative undertaking involving objects of art, reproductions of those objects and related objects, and written descriptions and observations about works of art" (pp. 29–30).^[27] Even those arts scholars working in interdisciplinary areas, where collaboration is often the norm, are "definitely loners" (p. 358).^[28]

The art historians' need for visual information, whether from primary or secondary sources, is a defining characteristic of this particular user group. The art object, or at least a visual representation of it, is essential to the art historians' research activities.^[29,30] This characteristic is shared by art students and artists in both the fine and the applied arts.^[20,23,31] A study of visual arts students confirmed that extensive browsing is another characteristic that this user group shares with more experienced art historians. However, as might be expected, student browsing was more general in nature than that of arts historians. Students in the study "claimed they looked for images that

broadened their knowledge about art or a specific area of art, that addressed specific creative problems and inspired or offered relief from creative block" (p. 448).^[20] Students were also interested in survey material on the history of Western art and in material that described specific works of art in the artist's own words. However, when asked whether they sought help in finding appropriate library resources to meet their information needs, only a few students in the study admitted that they had asked a librarian for assistance. Most students worked on their own or relied on other students for help and advice on where to find information. Further studies have confirmed that while library resources appear to be important in the development of student artists, finding ways to support their information seeking remains a challenge for academic librarians.^[19,32]

The question of how art historians have responded to the advent of online information and digital images has been addressed by several researchers. In 1995, results of a 2 year project to study the use of online databases at the Getty Center for the History of Art showed that "scholars' response to online searching was positive, if fraught with some anxiety" (p. 36).^[15] However, scholars were not comfortable with the new technology and did not use it as a routine part of their information-seeking process. In 1999, a further Getty report on the information needs and seeking of scholars and artists in relation to multimedia materials^[33] predicted that the speed of adoption of new technology by users of the Getty Institute would be slower than that shown by social scientists and natural scientists. This apparently limited use of technology by art historians is particularly surprising given the dependence on visual images as a source of information mentioned in many of the user studies cited above. Results of a survey conducted in 1999/2000 of 121 art historians based in British institutions of higher education indicated that less than half of the respondents (47.1%) felt that access to digital images had affected their work methods, while only 24.8% felt that digital images had affected their actual research interests.^[34] Further studies have continued to confirm this impression of art historians^[35,36] and conclude that "many have a rather limited awareness of electronic resources and haven't fully developed the skills to utilize them to their fullest potential" (p. 6).^[37]

Music Scholars

In contrast to art historians, scholars working in the area of music have been the subject of only a few formal studies. Most frequently they are mentioned, if at all, in the context of other scholars working in the humanities^[11,14,15,38] or as a member of the fine arts faculty.^[22] Those instrumental instructors who are members of the fine arts faculties may also have secondary jobs as practicing musicians. Other areas of music scholarship include historical musicology, the study of music theory and composition, music education,

ethnomusicology, and electronic music.^[39] Like other humanities scholars, those working in the area of music are frequently interdisciplinary. The information resources they need include, but are not limited to “recordings and music scores including study scores, performance scores, and the scholarly collected editions” (p. 229).^[22] Especially for music scholars who are not instrumental instructors, the information resources will also include material from other disciplines, both within and outside of the humanities.

A useful model of the research process used by music scholars has been developed by Brown.^[40] Her model, based on interviews with 30 full-time noninstrumental music faculty was further tested through a survey of 175 music scholars in the United States and Canada. The model defines six stages in the research process, from idea generation to dissemination, and identifies information resources associated with each stage. The model, which built on research into the scholarly process of literary critics,^[41] shares many characteristics in common with those describing the work of art historians and confirms several of the major findings already identified in the literature such as the predominately solitary nature of the scholarly process, the reliance on personal as well as institutional collections for information, and the importance of browsing in the information-seeking process.^[26] Like Stam’s art historians, these music scholars also used informal channels of communication to keep up with current trends in their fields. Although these scholars did use e-mail and discussion groups to stay in touch with colleagues, they preferred face-to-face communication and personal interactions at conferences.^[42] Use of technology in general seems to have followed the distribution curve identified by Bates,^[43] although this in itself is surprising given that the study was conducted 5 years after the report of the Getty End-User Online Searching Project was released. However, no more recent data are available on the use of technology by scholars in the arts.

Other Arts Scholars

Research on other academic user groups in the arts (dance, film, theatre, etc.) is difficult to find. Faculty from dance and theatre were included in the study by Reed and Tanner focused on improving library services for fine arts faculty.^[22] Other insights into the information-seeking process of these scholars may be gleaned from the types of materials that are made available to them in specialized library collections.^[44] Librarians in art, music, and other specialized collections have long been intimately involved in the scholarly activities of their users and strive hard to understand their needs.^[45,46] However, an absence of user studies in this area has left a gap in our knowledge of how these users’ information needs and information-seeking behavior is changing as a result of the proliferation of online information resources.

Fine Artists

Very few studies have been done on practicing artists as a user group,^[47,48] and what exists can only be considered suggestive because of the small numbers that have been studied. A review of what literature there is about fine artists, including an annotated bibliography, may be found in the online version of Cowan’s 2004 article.^[49] As with the studies of scholars in the arts, what has been written about practicing artists has looked primarily at artists’ use of libraries, both actual and potential, and has not focused on their broader information needs. Studies of this type include Cobbledick’s interviews with four artists—a sculptor, a painter, a fiber artist, and a metalsmith—and Powell’s interviews with nine studio artists.^[4,50] Cowan’s own study reports the results of a series of interviews with a single artist. While none of these studies produced generalizable results, they do point to some common characteristics among artists. Like other humanities user groups, fine artists tend to work alone and to browse extensively in search of inspiration or useful information. However, Cobbledick points out that, “the extent and importance of browsing can be overstated,” since the artists she interviewed looked for information with a specific need in mind and browsed only within a limited range of material (p. 362).^[4]

Musicians

User studies of practicing musicians are at least equally scarce and, like other studies of users in the arts, have focused primarily on the information needs that can be addressed by library services.^[51,52] A 2006 study of composers of electroacoustic music notes that, not only are there no user studies of this “idiosyncratic group,” but also “the larger community of composers of music” has not been addressed (p. 1 and 3).^[53] Similar to the studies of fine artists, the findings about electroacoustic composers are based on a very small sample—five composers who were graduate students in American universities. However, an important characteristic of these users may have relevance for other groups of artists as well. While their creative output situates these composers in an arts discipline, their information needs include resources from computer science, engineering, and mathematics. Even though these types of interdisciplinary needs were not identified specifically in the studies of fine artists, the increasing use of computer technology in all forms of art makes it likely that other types of practicing artists would have similar information needs. In addition, artists of the generation just now entering into its most productive years are individuals who grew up with technology. The tools for their creative processes will most likely include a higher number of interdisciplinary resources than ever before.

Another significant characteristic of this user group is its dependence on Internet-facilitated information sources

such as e-mail, Listservs, and Web sites. The composers in the study reported using Listservs to find information on technical questions, while Web sites of professional organizations provided information on conferences and festivals. Personal Web sites were used by the composers to find information on other composers and to communicate information about themselves. While communication with colleagues was seen as an important source of information for both scholars and artists,^[4,12,42] the artists interviewed by Cobbledick in 1995 did not embrace the use of the available technology to support their information-seeking or communication activities. Whether this is a characteristic of fine artists compared to musicians or whether this is a generational effect requires further research to determine. An interesting insight into the creative process of musicians can be found in the discussion by Eaglestone, Ford, Brown, and Moore.^[54]

Other Artists

Reports about the information needs of practitioners in other arts disciplines are largely anecdotal. National service organizations such as the American Composers Forum, American Music Center, Chorus America, Dance/U.S.A., League of American Orchestras, Meet the Composer, National Performance Network, OPERA America, and Theatre Communications Group provide information services to both organizational and individual members as well as hosting conferences and meetings at which information is exchanged. Much of the information provided by these organizations is practical in nature, addressing the mundane needs of the users, such as employment opportunities, rather than supporting their creative activities. However, these organizations also provide fora for discussions of artistic issues, information about trends in the disciplines, and opportunities for networking with colleagues. Since these organizations serve a national membership, much of the information they provide is disseminated electronically through e-mail, Listservs, discussion boards, and organizational Web sites. Other organizations such as the Performing Arts Data Service (PADS) in the United Kingdom maintain Web sites that offer a wide variety of digital resources to researchers and other users in the areas of music, film, broadcast arts, theatre, and dance.^[55] Most of these organizations keep statistics on user requests and make some effort to identify user needs. However, systematic studies are yet to be done in these areas.

IDENTIFYING AND RETRIEVING ARTS INFORMATION

Although simple text retrieval has long been the norm for traditional library literature, information retrieval in the arts is no longer primarily text-based. Other sources of information, especially digital images and sound, play

important roles in satisfying the information needs of scholars and practicing artists. Each type of information—textual, graphic, and sound—presents different challenges to users looking for arts information.

Subject Retrieval

Subject retrieval (e.g., by a particular artist, work, or theme) has traditionally been one of the common ways in which users access material about the arts. Results from the Getty End-User Online Searching Project show that 49% of the scholars in the study used individual names as subjects in their searches and 57% used some other common term.^[43] However, a persistent obstacle to building large-scale subject retrieval systems in the humanities has been the “diversity and complexity of textual, graphic, aural and artifactual sources used by scholars in their research” (p. 608).^[56] According to Tibbo, “the interdisciplinary and unique research interests of humanistic scholars make convenient subject coverage with appropriate index terms challenging” (p. 616).^[56] With the increase in full-text databases, especially of secondary material, there “seems to be an assumption that full-text searching is the solution to all information retrieval problems” (p. 228).^[57] Unfortunately, full-text searching is not a panacea, and users often become discouraged or frustrated by the number and range of the items that are retrieved. This leads East to predict that, even though vast amounts of secondary material is now being made available digitally, “it seems all too likely that they [scholars] will use these digital collections to look for documents that they have identified from other sources rather than performing subject searches to discover further resources” (p. 239).^[57] This is consistent with earlier findings that humanities scholars do not make regular use of abstracting and indexing tools except when “venturing into unfamiliar areas,” but prefer to follow bibliographic references from sources already known to them (p. 204).^[58]

Image Retrieval

The advent of searchable databases of digital images has dramatically changed the way users look for graphic materials. In 2000, all of the major information sources for the visual arts listed in Blazek and Aversa’s guide were print materials.^[1] Today, few students or scholars would rely on print material but would look instead for digital images.^[21] There are now numerous large image collections available to researchers all over the world. For example, in 2001, The Andrew W. Mellon Foundation launched ARTstor, a collection of digital images available on the Web for use by scholars and educators.^[59] The collection includes approximately 700,000 images in the areas of art, architecture, the humanities, and social sciences. ARTstor: Images for Education and Scholarship, see: <http://www.artstor.org/index.shtml>. Other major image databases

exist, providing access to some of the most extensive library and museum collections in the world.^[60] One result of the shift to digital images from print material is that “more and more users perform searches on their own,” rather than relying on the help of human intermediaries such as art librarians (p. 696).^[61] This trend has made research into user issues such as relevance criteria essential. How users look for images and evaluate what they find continues to be an area for fruitful investigation. Two studies funded by the British Institute for Image Data Research (IIDR) and Resource: The Council for Museum, Archives and Libraries have provided a foundation for further research.^[62,63] Additional issues arise in the area of multimedia retrieval, which involves the retrieval of two or more media, i.e., text, image, or sound.^[62,64] In multimedia retrieval, as in image retrieval, the success of the process depends on the appropriate representation of the item content and the indexing tools available to describe it.

Melodic Retrieval

In the past, users looking for a particular piece of music needed to know the title, and preferably the composer, of the work they wanted. The difficulty of such a task may be imagined from the fact that the Music Division of the Library of Congress has several million pieces of published sheet music, most of which is not fully cataloged. The Library of Congress, Performing Arts Reading Room, see: <http://www.loc.gov/tr/perform/askalib/aboutsheetmusic.html>. Although music scholars and practicing musicians may have the expert knowledge to find the music sources they need, the general public often asks a librarian to identify a piece of music based on a few hummed bars. Since the 1990s, with the increase of digital music collections, information retrieval researchers have been studying the possibility of electronically searching musical databases by means of direct acoustical input.^[65] An important characteristic of the “query-by-humming” approach is that the user of the system does not need to have expert knowledge of music notation or theory.^[66] In its simplest form, query-by-humming allows the user to “sing a few bars and have all melodies containing that sequence of notes retrieved and displayed” (p. 11).^[65] Approaches to melodic retrieval have been investigated by a number of researchers. Results of several studies may be found at the University of Illinois’ music-ire Web site <http://www.music-ir.org/>. These results show that mismatches between the query and the desired retrieval target are still frequent.^[67] Difficulties occur both because of the “limitations of amateurs in the vocal production of melody,” (p. 688),^[66] and because of the technical aspects of the retrieval process. However, work in this area is sure to become more sophisticated due to the increasing popularity of searching for music to download from the Web.

CONCLUSION

In the conclusion to her study on fine artists, Cobbledick wrote:

Artists need to have access to the universe of knowledge, not merely to some of its parts, and libraries that would meet their information needs must become access points to that universe. The development of computer networking, full-text databases and electronically stored images can help make this access a possibility, but it remains to be seen how the artist community as a whole will respond to these new sources of information once they become more readily available (p. 365).^[4]

It is unlikely that in 1996, Cobbledick could have foreseen how soon this prophesy would come true. Over the past 15 years, the impact of the World Wide Web as a growing source of information has been felt in the arts as in every other aspect of life. With an ease that was unthinkable when the early studies of users in the humanities were conducted, and was still unfamiliar when the 1995 report from the Getty Online Searching Project was released, scholars and practicing artists can now search for information from the greatest libraries and museum collections without ever leaving their homes. However, retrieval of textual, image, and sound data still poses significant challenges for the user. Research into various types of retrieval systems as well as the broad range of users’ information needs is still necessary. Traditional user studies in the arts have focused primarily on scholarly research, with some exploratory studies into the information-seeking behavior of practicing artists. While these have provided insights, research is needed to investigate more fully the contexts in which users search for information as well as the barriers that exist to meeting their information needs.

Abstract

ASLIB was, from 1924 to 2010, an independent membership organization for special librarianship, technical and commercial information work, and latterly for information management. It was highly influential in the development of documentation and information science, in the United Kingdom and worldwide. Its activities included research and consultancy, training, professional development, publishing, and technology development. ASLIB was for many years the *de facto* UK center for information research, especially information and library management, information organization, and computer applications. It has had several names, being at times the Association of Special Libraries and Information Bureaux, ASLIB, the Association for Information Management, and ASLIB. In 2010, ASLIB became a part of Emerald Group Publishing, and activities ceased in 2016.

INTRODUCTION

ASLIB was, from 1924 to 2010, an independent membership organization for special librarianship, technical information work, and information management. It was highly influential in the development of documentation and information science. Since 2010, it has been a part of Emerald Group Publishing. It has had several names, and name variants, over the years, and for convenience it is referred to as ASLIB throughout this entry. This entry is structured into five chronological sections, reflecting major changes in ASLIB's status.

ORIGINS

ASLIB was founded as a direct result of a conference held at Hoddesdon, Hertfordshire, England, in September 1924, at which delegates from British special libraries and information bureaux met to discuss the desirability of an association to represent their interests. For a full account of its origins, see Muddiman^[1,2] and Hutton,^[3] and for personal recollections, see Pearce.^[4]

Its origins, like much of the information environment emerging at that time, can be traced to the "second industrial revolution," beginning about 1870, in which new industries developed, based on the rapid developments in chemistry, materials science, metallurgy, electricity, and precision engineering. These industries were "information intensive," needing access to knowledge from scientific research, to data of all kinds, and to commercial and technical intelligence. Experience in the 1914–1918 war had shown the necessity for unimpeded access to such information, coordinated at national level.^[4,5]

This led to the need for individuals and departments who could provide such information, actively and in detail, in a way different from traditional libraries. Inspiration for such work was provided by the documentation movement, pioneered in Continental Europe by Paul Otlet and Henri Lafontaine.^[6,7] This used novel technical methods, particularly index cards, and intellectual tools, especially classification, to provide access to information at much finer levels of granularity than heretofore. (It may be noted that information technology and information organization have remained major themes throughout ASLIB's activities.) Companies, government-supported research associations for specific areas of science-based industry, universities, and larger public libraries throughout Britain began to set up special libraries, intelligence bureaux, and technical information sections. These efforts were largely uncoordinated and without any cooperation. Some initiatives had been undertaken, including a Conjoint Board of Scientific Societies founded by the Royal Society, which had advised on library/information matters between 1916 and 1923, and conferences organized by the government Department of Scientific and Industrial Research (DSIR) on these themes, but there was little to show for these efforts.

It was to attempt to improve this situation that the Hoddesdon conference was convened from September 5 to 8, 1924, at the initiative of staff from metallurgy research associations.

The conference was stated to be "open to all men and women who need to utilize information systematically, or who are interested in the conduct of information bureaux, intelligence services and special libraries." It is interesting to note that from this earliest stage ASLIB was open to information users, and those with any sort of interest in information matters; it was never envisaged as an

organization solely for what would come to be termed “information professionals.” Eighty-four delegates attended and resolved to appoint a standing committee of 16 members who had the task of creating an organization to promote cooperation and mutual assistance among information departments, to come into being within two or three years. Discussions with the (UK) Library Association about possible affiliation came to nothing; a story that was to be repeated 70 years later. A second conference in 1925 with over 200 delegates, addressed by Paul Otlet, showed continuing enthusiasm. At a meeting in London on March 29, 1926, the Association of Special Libraries and Information Bureaux, with the acronym ASLIB, was created, as an independent voluntary association. The association was formally incorporated on November 30, 1927. Its main objective was stated to be “To facilitate the co-ordination and systematic use of sources of knowledge and information in all public affairs and in industry and commerce and in all the arts and sciences . . .”

1924–1948

This period in ASLIB’s history is examined in detail by Muddiman^[1,2]; see also Ditmas.^[8]

The new association established itself in the Bloomsbury area of London, initially in Bloomsbury Square, and from 1928 in larger premises in Bedford Square, with a small office staff. In 1931, with the economy faltering and income dropping, there was a move to smaller offices in Russell Square. Its secretary at this point was Edith Ditmas, a formidable woman to whom Muddiman^[1] attributes a major role in ASLIB’s survival in these difficult times. (Muddiman notes that the *Daily Mirror* newspaper dubbed her the “Woman Oracle of Russell Square”.) Ditmas^[8] (p. 269) contrasted ASLIB’s position at “the centre of a spider’s web of contacts, each with a vast range of sources of information” with its situation as “an organisation whose only visible assets were one small room on the top floor of a tall Bloomsbury house, some ill-assorted office equipment which so filled the room that the wall-cupboards could only be opened when some of the furniture was moved to the landing, two typewriters and a typist.” The association lived in these straitened circumstances throughout the 1930s, moving to slightly larger premises in Museum Street in 1936, while managing to develop and extend its activities. Further discussions were held with the Library Association between 1928 and 1930 as to whether some form of amalgamation might be possible but in the end failed, due to partly ASLIB’s insistence that its interests were in the organization, management, and use of information, rather than in libraries *per se*. The nature of the ASLIB membership, institutional rather individual, and catering for users of information as much as for those directly involved in its management, also made integration problematic.

Its funding came largely from membership subscriptions, with limited support from grants from the Carnegie United Kingdom Trust. Membership, almost entirely institutional rather than individual, was 220 in 1927: the largest sections of membership were private sector companies (53) and scientific or technical associations (50) but also included were research associations (18), higher education institutions (18), and public libraries (17). Membership rose to over 400 by 1932, dropped to 280 in 1934 under the influence of economic depression, and had risen to 1043 by 1949, but the general balance of the membership categories remained largely constant throughout. Although ASLIB’s office remained London-based, regional branches were formed in the 1930s, two for the north of England, in Lancashire and Cheshire and in Yorkshire, and one for London and the Home Counties in southeast England. Internationally, ASLIB became closely tied into the pan-European efforts to develop the documentation movement into what became in 1937 the Federation International de Documentation (FID). From its earliest days, it had close links with the British Society for International Bibliography, an affiliate member of Otlet’s International Institute of Bibliography. The two organizations worked closely together on issues of classification and indexing, and on promoting documentation principles. There were also links with the United States: Hutton^[3] notes that a representative from the U.S. National Research Council was present at the Hoddesdon conference, and thereafter there were few ASLIB meetings without an American representative or contribution.

ASLIB’s main objectives throughout this period were to foster cooperation within the special library sector, to enable interaction and exchange of experience between those working in the area, to act as a clearinghouse for specialized information, and to promote, and lobby for, the wider dissemination and better use of published information. While there was never any intention of ASLIB’s creating its own central collection of information, its first chairman, J.G. Pearce of the British Cast-Iron Research Association, suggested that it should promote a “free trade in non-confidential information” and thereby “unlock the intellectual capital of Britain.”^[4]

The ASLIB annual conferences, initially attracting 200 delegates from the United Kingdom and overseas, rapidly became a fixture, known for their successful mix of the theoretical/technical and the practical/vocational. Their topics covered developments in bibliography, documentation and classification, technical advances such as microforms and reprographic techniques, and planning and management processes. Most notable was the conference of 1938, held jointly with the FID with large numbers of international delegates, meeting under the shadow of the Munich crisis, and which may be seen as foreshadowing the end of the internationalist documentation movement.^[9]

An enquiry service was launched at an early stage, offering advice by telephone on the best sources for specialized information. A register of specialist translators was established in 1931, an indicator of an area in which ASLIB was to be heavily involved for several decades.

Publications was also an early area of activity: the first *ASLIB Directory: a guide to sources of specialised information in Great Britain* appeared in 1928; the *Aslib Information* newsletter in 1929, initially quarterly, and later monthly; and in 1935, the quarterly *ASLIB Book List*, an alerting service of significant new scientific and technical books. From the mid-1930s, publication of reference works began, typically annual listings of technical books, directories, and yearbooks.

Education and training for special libraries was also a concern for ASLIB, and attempts were made from 1929 to persuade educators to give this greater attention. As a result of ASLIB's lobbying, the library school at University College London introduced an elective special libraries course that ran intermittently throughout the 1930s, while the Library Association included the topic in the syllabus for its Fellowship examinations, though not for the more widely followed Associate examinations. This was not regarded as satisfactory, and education and training for the special library and technical information sector was to become a major theme for ASLIB in the following decades.

The 1939–1945 conflict initially caused predictable problems for ASLIB, as its regular activities and membership decreased due to wartime conditions. However, in the longer term, its contributions to the war effort greatly increased its profile, and established it on its postwar path. There was a need to keep up, and increase, the flow of information for industrial and military purposes, in face of the disruption to the normal publication and communication channels, due to shortages of materials and personnel and the cessation of communication with continental Europe, as well as potential and actual destruction of collections through bombing. In 1941, ASLIB was funded by the Royal Society and the Rockefeller Foundation to research the problems and propose solutions. This led to ASLIB designing and managing a service to obtain difficult-to-obtain materials of all kinds, generally those originating in hostile or occupied countries, obtained through neutral nations, reproduce them on microfilm, and distribute them to Allied scientific, industrial, and military recipients worldwide. Funded by the UK and U.S. governments, and based at the Science Museum in London, the service, kept secret throughout the period of its operation, made a considerable contribution to the war effort and was maintained after the war's end, management being passed on to the Royal Society of Medicine.^[10,11] Other contributions included a series of *War Time Guides to Specialized Sources of Information* in important technical and industrial areas (essentially sections of the *ASLIB Directory*, revised and updated to

reflect the wartime situation), and an expanded enquiry service. A series of short training courses in special librarianship were also run from 1943 onward and proved very popular. ASLIB's first textbook, a *Manual of Special Library Technique*, was published to supplement these courses. The value to the nation of these activities was recognized by the British government, which, in 1944, made a substantial grant to ASLIB over a five-year period, via the DSIR.

In the immediate postwar period, and with its newly found success, ASLIB reflected on its future course.^[1] Should it become an individual member professional association, or focus on a role as a national documentation center? If the latter, should it remain independent, or seek to become a part of a monolithic state-run information institute? Eventually, it settled upon development as a partly state-supported independent entity, focusing on a continuation of its role as a coordinator and facilitator of the national system of special libraries and technical information centers. Its high status as a result of its wartime contributions saw ASLIB participating in numerous committees and official bodies relating to information and documentation, and it took a significant role in the highly influential Scientific Information Conference organized by the Royal Society in 1948.

With this aim made possible by an increased membership, and a government grant linked to membership income, ASLIB expanded its activities considerably in the late 1940s, with its membership rising to over 1000 and its staff to 16. Its main areas of focus were enquiries (with over 3,000 telephone enquiries and over 30,000 written enquiries *per annum* by the end of the decade); conferences and education; expansion of international activities; promotion of, and lobbying for, the importance of special libraries and technical information; and publications.

In respect of publications, in 1947, ASLIB launched an academic and theoretical journal, *Journal of Documentation*, to complement its more ephemeral and practical serial publications. The following year, *Aslib Proceedings* was launched, for the publication of papers given at conferences of ASLIB and related organizations.

In the education area, the 1948 ASLIB annual general meeting passed a resolution agreeing to develop a postgraduate qualification in information work. This ambitious proposal was never followed up, and instead ASLIB embarked on creating an extensive program of short training courses.

Muddiman^[1] sums up the situation at the end of this phase of ASLIB's life by agreeing with its claim that it was generally recognized as the main British clearing-house for specialized information and had scope for expanding this role in several ways in an increasingly information-conscious environment. It was at the center of the emerging field of documentation, which would develop into information science.

1949–1980

Issues in the period have been reviewed in part by Muddiman,^[2] and by Wilson,^[12] who draws attention to the way in which ASLIB reached out to those beyond the library world with an interest in information and focused on information management as an integral part of management as a whole.

As a response to its new situation, ASLIB transformed itself into a new organization with a new corporate structure, and a new name. Proposals for a “new ASLIB” had been announced in 1948, and on May 24, 1949, the association formally combined with the British Society for International Bibliography, with which it had long had close links. The new association was simply titled “ASLIB.” The joining of the two organizations, one with a largely institutional membership and one with exclusively individual members, gave a unique flavor to the organization. So too did the mix of funding: partly direct government support, partly membership subscriptions, and partly fees for the increasingly wide range of services provided. The 1977 annual report comments that, because of this mixed membership, people had different ideas about what ASLIB was, decades after its restructuring.

Edith Ditmas retired as director at this point, to devote herself to study and research, and also to do editorial work for ASLIB. She was succeeded as Director by Lesley Wilson who saw himself as a modernizing manager, and who steered ASLIB through the growth of the next three decades.

With the security of a further five-year grant-in-aid from the DSIR, matching membership subscriptions, ASLIB moved to larger premises in Palace Gate in west London, to cater for the increased staff numbers: 16, serving a membership of just over 1000. The new building gave the director an individual office for the first time, together with a glass-enclosed veranda used for meetings. The membership at that time comprised 32% research associations and learned societies, 20% industrial and commercial, 20% overseas members (uncategorized), 9% UK government departments, and 19% individuals, and it grew steadily year on year, reaching a highpoint of nearly 3000 by 1966. Staff numbers increased to match, reaching 29 by 1955, 51 by 1964, and attaining a maximum of 69 in 1971, reflecting the much wider range of activities being undertaken by then. The director always had a major influence on the organization’s direction, advised by a council largely comprising senior figures from the information world, from the scientific establishment, and from industry. The first chair of the council in the new ASLIB structure was Harry Hyams of Shell Petroleum; three decades later, his nephew, Montagu Hyams of Derwent Publications, was to be appointed vice president of the ASLIB Council. In a manner typical of a British organization of the time, its council always included a proportion of Honorary Members, representing the upper strata of society.

In 1958, it could count an earl, a baroness, and four knights among its members; 10 years later, it had a viscount, two lords, three knights, and a vice admiral.

Although ASLIB remained headquartered in London throughout the period, regional branches for Northern England and for Scotland were established in the new structure, joined by a branch serving the English Midlands in 1951. These regional branches remained unchanged throughout the life of ASLIB as an independent organization. An ASLIB office opened in Birmingham, in the Midlands region, in 1968, sharing facilities with other organization and staffed by one liaison officer. Overseas membership remained significant, at least 20% of the total, throughout the period, and there were proposals for an overseas branch structure. Nothing came of this, perhaps due to the wide geographical spread of membership, with over 70 countries generally represented.

A new initiative was the setting up of special interest groups among the membership: in 1951, groups were set up for aerospace, textiles, economics, and food and agriculture, and in the following two years these were joined by engineering, fuel and power, and chemicals. This set of groups was fluid through this period, as groups formed, merged, renamed themselves, and disbanded. Most common were groups, liked those named above, devoted to information in a particular industry or sector; they were later joined by groups for the furniture industry, for film libraries, for biosciences, for social sciences, for transport, and for electronics. Other groups focused on processes and techniques, such as the technical translation, mechanization (later computer applications), and coordinate indexing (later informatics) groups. Only one, the One-Man Band group, brought together those working in similar environments (a note in the February 1990 issue of *Aslib Information* pointed out that although women were in a majority of the membership and the committee, the group liked the imagery of the male name, rather than the gender-neutral One-Person Library). Some of the larger groups, with memberships of several hundred, had activities and reach equivalent to that of professional bodies in their own right, and some undertook original research; see, for example, the Informatics group’s study of the indexing process.^[13] The branches and groups contributed greatly to ASLIB’s activity, with extensive programs of events and publications complementing the central provision.^[14]

Conferences and meetings were a major preoccupation. The ASLIB annual conference became one of the major events of the year for the information professions, and a great variety of both regular and *ad hoc* conferences and meetings were organized, both centrally and by groups and branches, and covering the whole gamut of topics relevant to the wide interests of the ASLIB membership. A few themes are constant throughout the period: management processes and costs; demonstrating the value of information; planning and control of operations; document handling and reproduction; subject-specific resources;

classification and indexing; dealing with publishers and other suppliers; new technologies and research results; translations and the language barrier; and reports of international developments. A particularly notable venture was the organization, on behalf of FID, of the influential Dorking conference on classification in information retrieval.

Training programs were developed further, the main offerings being courses for newcomers to special library and information work at either junior or senior levels, soon joined by a course of intermediate-level staff.

In all, there were typically at least 10 ASLIB events, including training courses, per month throughout this period, rising at times to 20.

The publications program continued, based around the four periodicals—*Aslib Information*, *Aslib Proceedings*, *Journal of Documentation*, and *Aslib Book List*—regularly updated directories, and bibliographies and guides to information sources in specific subjects. An *Index to Theses* from British universities commenced annual publication in 1953. The register of specialist translators, which in 1950 included 126 names, was complemented by an *Index to Scientific and Technical Translations*, later renamed the *Commonwealth Translations Index*. A similar register of specialist indexers was established later but was never so successful as that for translators; this was attributed to the competing services of the Society of Indexers, whereas ASLIB was alone in providing access to translators.

A series of ASLIB manuals, providing detailed and practical advice on special library topics, was established. In 1956, the first issue of the highly regarded and influential *Aslib Handbook of Special Librarianship and Information Work* was published. In subsequent years, the publication program expanded to encompass textbooks and monographs on a variety of information-related topics.

The enquiry service, renamed later as the information service, continued its work of providing answers and referral to technical queries. It was complemented by a new in-house ASLIB library, with a collection of journals, books and pamphlets, and facilities for document reproduction. This dealt with queries on library/information issues. To give an idea of the early scale of operations, in 1950, 100 periodicals were taken in the library and 271 books and 228 pamphlets added to the stock. There were 138 personal enquiries, 868 by post, 1310 by telephone, 718 loans of material, and 94 requests for translations. As an extension of this kind of work, a consultancy service was established in 1952, to deal with enquiries needing considerable work to solve. The use made of the service grew dramatically, so that in 1956 more than 30,000 requests were made, attributable in part to a large number of new members from small or one-person information departments.

Lobbying and promotion activities, as throughout all of ASLIB's existence, involved a continual process of direct

contacts with government ministries and agencies, and with international organizations, on many information-related topics. ASLIB were also represented on numerous national and international committees and working groups of many organizations: the British National Committee on Documentation, British Standards Institute, International Standards Organization, National Book League, British National Bibliography, UNESCO, the British National Committee of UNISIST, and IFLA, to name but a few. ASLIB also served as the British representative to FID and in a joint panel with the Confederation of British Industry considering industrial information issues.

In 1956, a "staff employment register" was established by the membership department. This later developed into a full recruitment agency activity.

The last of ASLIB's major activities was initiated in 1957, when a research committee was formed, and produced an outline for a research program into aspects of library and information work; this covered a wide area, including library procedures, information retrieval, costs and effectiveness of services, indexing, bibliographic control, abstracting services, and access to non-English material. From the start, it had an emphasis on rigorous research with clear practical application that became the hallmark of ASLIB's research in later years. The research department was set up in the following year, its first remit being the oversight of the Cranfield retrieval experiments on behalf of the funders, the U.S. National Science Foundation. Projects over the next few years included studies of the language barrier, on interlibrary loan in special libraries, on abstracting journals and on gray literature, and a major study of information users in science and technology.

As early as 1955, with 29 staff and 1187 members, there had been complaints that the ASLIB headquarters was cramped, so that, for example, members could not read in the library. Two years later, with 32 staff and a membership doubled to 2254, the situation became impossible, and in 1958 ASLIB moved to its own buildings in the imposing surroundings of Belgrave Square, in London's West End. The move was supported by a government grant and donations by members to a building fund. The effort was worth it, as the following year's annual report concluded that the building provided, for the first time in ASLIB's history, fully satisfactory conditions for staff, committee meetings, courses (which could now be held in-house), the library, and other activities.

The new building, together with a further DSIR five-year grant and a steadily increasing membership, led to a general expansion of activities. To the existing training courses, which provided a general introduction for new special library staff, were added specialized courses on a range of topics including patents information, classification, Eastern European material, and document production. The courses typically lasted between three and five days, indicative of a less time-pressured age. The space in

the new building allowed courses to be complemented by demonstrations and exhibitions of equipment and procedures, such as photocopying and journal binding. Training was now seen as so significant that in 1960 the post of education officer was established to plan new courses. ASLIB also joined in discussions with the UK Institute of Information Scientists on formal training for those engaged in technical information work and endorsed the syllabus of the two-year evening course at Northampton College of Advanced Technology (later City University London), which later became the MSc Information Science.^[15] In 1963, ASLIB produced a leaflet on "Information work as a career," aimed at school leavers and college students, which was effective for many years in bringing more publicity to what had been a little known profession.

By the time ASLIB's 40th anniversary was celebrated in 1964, it was approaching its peak in term of size, with a full staff complement of 70 serving a membership of nearly 3000. It was a major force on the national and international information scene, in particular in respect of its conferences, publications, and research, as well as its lobbying and influencing.

Peak member numbers were reached in 1966. The annual report covering that year recorded 2887 members: 1014 industrial and commercial members, 205 from UK government departments and agencies, 272 public and national libraries, 459 universities and colleges, 403 other nonprofit organizations, and 534 individuals. Thereafter, a gradual decline in membership set in; by the end of this period, in 1980, the total membership was 2082.

The nature of government support for ASLIB changed around this time. A new government department, the Office for Scientific and Technical Information (OSTI), was formed in 1965, partly a result of ASLIB's representations for the need for long-term government policies toward information services. One of OSTI's first initiatives was a joint investigation with ASLIB on ways of strengthening ASLIB's research, consultancy, and training activities. One result was a decision to focus on computer applications. Another was a strong steer toward applied rather than basic research, and to make a closer link between research and consultancy. The report recognized ASLIB as a prime mover in information research.

Thereafter, government support for ASLIB came from OSTI, and later from the British Library's Research and Development Department, and was focused on supporting specific activities and programs, rather than the previous open grant-in-aid arrangements. As a result, the research department expanded considerably, and produced a remarkably wide body of results,^[16] becoming the *de facto* national center for research in information science and documentation. In 1966, it had a staff of 15, divided into teams focusing on mechanization, operations, and surveys. It also offered consultancy and advice services, which brought in a significant income, and contributed

books and reports to ASLIB's publishing program. The following year it moved into its own premises in Hobart Place, close to the main ASLIB building, with new projects on cost-effectiveness, on bibliographic records, on computer typesetting, on clerical processes in libraries, and on the use of metals information. In 1970, it changed its name to the Research, Development, and Consultancy Division (in 1979, this would become simply Research and Consultancy), reflecting a renewed focus on helping members to solve their information problems, with a particular focus on cost-effectiveness and on new technology. In 1975, the department, now with 17 research staff and 5 full-time consultants, moved to still larger premises in Bedford Row, Bloomsbury.

The training program also expanded along the lines recommended in the OSTI report, launching courses in mechanization, microforms, dissemination of information, systems design, information retrieval, and thesaurus construction, as well as information for subject-specific areas such as business, finance, food and agriculture, pharmacy, and medicine. The training program took on, for the first time, an international dimension: a course was held in Nairobi for participants from several East African countries, and other courses were organized in London for visiting groups from overseas.

The events program diversified further. The annual conference was held outside the United Kingdom for the first time, in the Netherlands in 1966 and in Germany in 1971. An annual ASLIB lecture series was started.

The publications program also diversified, with a number of new monographs on topics such as mechanization, classification, and thesaurus construction, a new *ASLIB Reader* series, bringing together significant writings of topics of central importance, and a range of directories and bibliographies. A third, and much expanded, edition of the *ASLIB Handbook* was produced. The contents list for this handbook give a good indication of what ASLIB considered to be core elements of its area of operation at this stage:^[17] the special library and information service, administration, selection and acquisition, classification, information retrieval, filing and storing, technical report literature, library planning, service routine, subject enquiries and literature searching, abstracting, publications of the information department, mechanical aids in library work, and organizations in the special library field.

A new *Aslib Occasional Publications* series was started to disseminate reports from the research department: early examples dealt with the changing nature of the scientific journal, the use made of technical libraries, and the library/information literature. A new journal, *Program*, dealing with library automation and formally published by the School of Library Studies at the Queen's University Belfast, was incorporated into ASLIB's periodicals portfolio, as was the *Technical Translators Bulletin*, formerly published by the special interest group, and *Audiovisual Librarian*, previously published by the Audiovisual group.

Publication of *Forthcoming International Scientific and Technical Conferences* was taken over from the UK government Department of Education and Science. In 1969, ASLIB partnered with the Library Association in producing the new *Library and Information Science Abstracts* secondary publication, this arrangement continuing until 1980.^[18]

The employment register, now established as a licensed recruitment agency, was renamed the Professional Appointments Register and became one of the few agencies specializing in library and information jobs.

The library took on the role of systematically collecting thesauri, subject heading lists, classification schemes, and bibliographies, and regularly listing them.^[19,20] In 1979, this was formalized by ASLIB being nominated by the British Standards Institute as the official clearinghouse for British thesauri, including those planned or in preparation.

By the mid-1970s ASLIB was still at the peak of its activities and influence, a small decline in membership having been offset by income from other sources, particularly consultancy to large national and international bodies. However, changes in the economic, social, and technical environment began to cause concern for the future. One immediate response was for ASLIB to rationalize its idiosyncratic membership structure. Individual members were offered a reduced fee as affiliates, without the voting rights of full, institutional, members, and the anomaly by which any UK government department could have free membership by virtue of the grants supplied by the government was removed. Student membership was introduced to attract the new generation.

At an ASLIB conference on “The information worker: identity, image and potential” held in London in November 1976, Dennis Lewis of ICI Plastics Division gave a talk entitled “There won’t be an information profession in 2000 AD”; Lewis’s “Doomsday Scenario” came to have a major influence on the future of ASLIB. In the following year, ASLIB suffered its first major cutback, when rising costs forced the reduction of the research department from 17 to 11. In 1980, it was further reduced by three, and its separate premises were given up.

Other trends at the time were positive, with ASLIB becoming a European center for the promotion of the new technology of online searching, which led to a focus on this topic in the library, which hosted an online information center, research projects, training courses, and publications, including monographs, particularly J.L. Hall’s influential *Online retrieval sourcebook*, a “European user” series, how-to guides, and a new monthly newsletter, *Online Notes*. In 1978, ASLIB’s long-standing interests in technical translation and in applications of technology came together in the organization of the first of the *Translating and the computer* conferences, which were to continue for over three decades.

In an environment starting to give concern to all information-related professional organizations, there was a renewed interest in cooperation. A Joint Consultative Committee, involving ASLIB, the Library Association, the Institute of Information Scientists, the Society of Archivists, the British Library, and the SCONUL academic library group, was revised after some years of dormancy, and a tripartite conference between the first three organizations was held in Sheffield in September 1980.

1980–2010

This next stage of ASLIB’s story is one of an attempt to adapt to a changing environment, which saw some innovation and success, but overall a decline and retrenchment, which, at the end of period, saw ASLIB lose its independent status.

The reasons for this somewhat depressing state of affairs are multiple and affected many other information-related organizations in similar ways. Most immediately, the UK government ceased to offer direct financial support, in the way that it had for nearly four decades. This not only affected ASLIB directly but also the research associations and similar bodies that made up a significant part of the membership. The decline of British science-based industry over the period had a direct effect on ASLIB’s membership, as did changes in the information environment that led to the merging, downsizing, or closure of many special libraries (appropriate enough, one the 1980 conferences addressed the topic of “cuts and the special library”). Organizations of diverse type, including consultancies, publishers, and universities, were increasingly involved in the activities that previously had been left to organizations like ASLIB. Finally, social changes posed changes for very many membership-based professional bodies, and ASLIB, despite its unique position and generally loyal membership base, was far from immune to this.

Dennis Lewis, who had predicted the demise of the information professional, took over in 1981 as Director from Basil Saunders, who had served for a short period following the retirement of Leslie Wilson. He produced a development plan for ASLIB, which, in view of the deteriorating financial situation, was put into action in 1985, earlier than anticipated, moving toward a “slimmer and trimmer” organization, run on fully commercial lines.^[21] ASLIB left the fading splendor of its Belgrave Square location for premises in the Holborn area of central London. The research and consultancy division was closed, the research staff continuing to work on British Library projects, and the consultants forming an independent “Information Partnership.” ASLIB still offered a limited consultancy, associated with the information service and the training program, as it does to the present day. The cessation of ASLIB research caused dismay to many in the

information world and is still seen by many as marking the end of ASLIB's unique position in that world. Small survey research was still carried out at ASLIB; see, for example, a survey of IT use by the information service.^[22]

The new vision was for a focus on membership services, publications, and professional development, with ASLIB undertaking a positive leadership role in the development of information management in the United Kingdom. At the time, the byline "The Association for Information Management" was added to the ASLIB name.

The branches and groups continued active programs, with some new groupings added, most notably the Information Resources Management Network.^[23] The Informatics group was involved in organizing a series of Information Retrieval Package fairs. The nature of the conference program changed, with the long-standing annual conference supplanted by less regular multipartite events with other information organizations. The staff register was spun off as "ASLIB Professional Recruitment," an independent wholly owned subsidiary of ASLIB.

Publications expanded, with an ambitious program of new books, and new journals in local area networking and records management. More emphasis was placed on shorter publications, particularly addressing topical issues: these included a series of monthly newsletters on topics such as information technology, library automation, and business information, and a series of short "Know How Guides" on a variety of information technology and information management topics.

The training program, now offering almost exclusively one-day courses, was further expanded, particularly in areas of technology and online searching. More than 50 courses were run in 1985, more than half dealing with some aspect of online searching. Ten years later, the ASLIB training program was similarly responsive to the needs of moment in focusing on Internet-related courses.

In 1989, Dennis Lewis was succeeded as Director by Roger Bowes, a former newspaper executive, who continued Lewis's policy of downsizing to profitable areas, and on corporate information management as ASLIB's focus. The organization moved premises again, to Old Street in the eastern part of Central London. Advantage was taken of the layout of the new building to create a "One-Stop Information Shop," with services including quick reference, desk research, library, consultancy, and recruitment visible and accessible from the street. The Society of Archivists took up space in the building, and it was hoped to make it a focus for other information organizations. However, this did not happen, and ASLIB moved again to occupy two floors of an office building in the City of London.

The Saunders report of 1989 recommended the merger of the independent UK information-related associations, to form a single body to represent the information professions. ASLIB took an active part in the discussions, particularly with the Library Association and the Institute

of Information Scientists, but concluded that the association was too different in nature and purpose for a merger to be feasible. ASLIB therefore stood apart from the merger of the other two organizations that formed CILIP; many considered this a missed opportunity to carry ASLIB's values and perspectives further.

In 2002, a further major downsizing took place, as ASLIB abandoned their publication activity, selling their books business to Taylor & Francis, and their journals to Emerald Group Publishing, with ASLIB members given favorable terms as purchasers and subscribers. Only a monthly *Managing Information* newsletter, the successor to *Aslib Information*, remained. Thereafter, ASLIB and Emerald worked increasingly closely together in providing services to the membership.

Shortly thereafter, the ASLIB library and information service closed, and its stock and the organization moved to smaller premises near Victoria Embankment. By 2005, membership had halved in three years, to less than 800, and in the same period staff numbers had fallen from 40 to 10. In December 2005, ASLIB went into voluntary liquidation.

It reemerged in early 2006 as a private company, having been bought by the former director, Roger Bowes. Operating from premises in Shoreditch, East London, it continued to offer professional development and recruitment services. The training program remained active, offering about 50 one-day courses, one of a wide variety of topics in information management, library/information skills, information organization, management, information governance, information technology, and subject-specific information. Onsite courses, on the customer's premises, were offered, and the first ASLIB distance-learning course, in thesaurus construction, was launched. There was still activity in some of the groups and branches, though most were becoming inactive, but the only regular conference was the long-standing *Translating and the Computer* meeting; ASLIB otherwise supported the meetings and conferences of other groups.

At the end of 2008, ASLIB moved to its final London location, an office suite in Goswell Road, Finsbury. With no in-house training facilities, courses were run, as in ASLIB's early days, in hired venues. The recruitment agency ceased operating during the course of the year, and the training courses, *Managing Information* magazine, and the *Translating and the Computer* conference were ASLIB's only remaining activities. The only active group was the combined engineering and technology special interest group; all the other groups and branches were dormant. Clearly, the organization was no longer viable as an independent entity.

2010-DATE

In April 2010, ASLIB was acquired by MCB Group, the holding company for Emerald Group Publishing Ltd. The

April issue of *Managing Information* noted that “Aslib will operate as a sister organization to Emerald, drawing on Emerald staff and resources, but still retaining its independence.” The London offices were closed, and ASLIB activity centered on Emerald’s headquarters in Bingley, Yorkshire. In the next issue, it was noted that “Our original ethos, which still applies today, was ‘to serve those engaged in the collection, treatment and dissemination of information in many departments of human activity’.”

Membership arrangements continued largely unchanged, though with an increased emphasis on Emerald’s general management information benefits. Training and group activity was initially suspended, though the annual *Translating and the Computer* conference was held, and the ASLIB yearbook and membership directory published online, and the *Managing Information* newsletter continued to appear, with a new emphasis on research reports drawn from Emerald publications. A new design and branding saw the uppercase “ASLIB” restored as the organization name, still with the “Association for Information Management” byline.

ASLIB was relaunched with a member meeting at the London Online Information Meeting in December 2010. Five Emerald staff were initially named as assigned to the association’s activities. An advisory council was formed, though sadly without any peers, knights, or admirals. A survey of the membership showed that training was the most highly regarded service, and the training program resumed in 2011, with public courses in London, onsite courses, and an increased distance-learning provision. The courses were categorized as business and official information sources, cataloging and classification, copyright and intellectual property, general management and communication skills, library and information management skills, and web and Internet. Most were based on courses offered formerly, but there were new offerings in social media and in web profiles and privacy. The engineering and technology group restarted activity, and a business information community of practice was formed.

Over the next three years, the program was slowly expanded. New training courses were introduced, in areas familiar from old ASLIB days, including information governance, information management, general management, and intellectual property. Some were in a half-day format, some ran outside London, and two-day “masterclasses” ran in Malaysia and Hong Kong. The 70th anniversary of ASLIB training activities was celebrated with a feeling that this element of the old association was still vibrant.

A program of member evening meetings and joint meetings with other bodies was started, and a two-day ASLIB Knowledge and Information Strategy Seminar at the British Library was held in December 2013, with the aim, again familiar from former days, of bringing together researchers and practitioners. Publishing activities under the ASLIB name restarted, with a series of monographs published by

Emerald “in association with Aslib,” and a new quarterly newsletter, *Privacy and Data Protection*, was launched.

However, Emerald proved no more able to sustain a membership-based organization than had the old ASLIB. It was announced at the end of 2014 that ASLIB would focus its efforts on expanding its professional development program. ASLIB membership and associated benefits, including group membership, ended, and the two newsletters ceased publication.

As from January 1, 2015, ASLIB was integrated with the wider Emerald organization, providing, in effect, a library/information professional development arm. No longer an association, it is known simply as “ASLIB.” The name also lives on in Emerald’s *Aslib Journal of Information Management* (formerly *Aslib Proceedings*). At that time, 34 courses were offered, as public courses in London and Manchester and as onsite training, with some via e-learning, in eight main areas: business and official information sources, information organization, copyright and intellectual property, customer services skills, knowledge management, general management, marketing and communication, and writing and editing.

In July 2015, Emerald announced that, in view of changing professional development requirements, ASLIB training courses would cease. All activities with the ASLIB name, other than publication of *Aslib Journal of Information Management* ceased in May 2016.

CONCLUSIONS

Richards wrote that the history of documentation, or information science, in Britain is largely synonymous with that of ASLIB, its members, and their activities.^[11] Muddiman^[11] suggested that ASLIB could fairly be regarded as an innovative organization, which actively shaped the development of the “informational turn” in society, and, in its earlier days, gave impetus to the involvement of the sciences of information and documentation in an increasingly information-intensive world. Both are correct, and we might also reflect on the number of the discipline’s thought leaders who have been involved with ASLIB: Brian Vickery, Blaise Cronin, Steve Robertson, and Alan Gilchrist to name but four. So multifaceted have its activities been that it is difficult to single out the most significant achievements, but they must certainly include the promotion of the idea of rigorous, applied research, support for the effective introduction of several generations of information technology into library/information settings, and a continual insistence on the importance of the information disciplines and professions.

The influence of ASLIB has been very great throughout its history, as it has reinvented itself through changing times, and we should remember that ASLIB’s story may not yet be over.

Abstract

The Association for Information Science and Technology (ASIS&T) was founded as the American Documentation Institute in 1937. In tandem with the evolution of the field, the association has continued to grow and change its structure and focus. This article describes the Association's history, purpose, structure (regional chapters plus topical special interest groups [SIGs]), governance, meetings, and publications.

INTRODUCTION

ASIS&T is an association of researchers and information professionals leading the search for new and better theories, techniques, and technologies to improve access to information. Among its membership are some 2000 individuals and organizations in over 50 countries. They have expertise in a variety of fields, such as information science, computer science, linguistics, management, psychology, library science, engineering, law, medicine, chemistry, physics, and education. They share a common interest in improving how individuals, organizations, and society store, retrieve, analyze, manage, archive, share, and disseminate information. Members come together for mutual benefit.

ASIS&T provides online and face-to-face educational and conference programs, a highly regarded journal and other publications, and local and international networking opportunities. These activities bridge the gap between research and practice and between theory and products. The Association's flagship publication is the highly regarded *JASIST*, the *Journal of the Association for Information Science and Technology* (formerly the *Journal of the American Society for Information Science and Technology*). ASIS&T is a nonprofit 501(c)3 professional association organized for scientific, literary, and educational purposes.

HISTORY

1937— Beginnings in Documentation

ASIS&T was founded on March 13, 1937, as the American Documentation Institute (ADI), a service organization

made up of individuals nominated by and representing affiliated scientific and professional societies, foundations, and government agencies. Its initial interest was in the development of microfilm as an aid to learning. Watson Davis, the Institute's first president (1937–1943), was the editor of *Science News Letter* and director of Science Service, a nonprofit organization founded to promote public appreciation of science. ADI compiled an impressive record of achievement in its early years: the development of microfilm readers, cameras, and services; fostering negotiations and research that resulted in the so-called gentleman's agreement covering the photo duplication of copyrighted materials; the establishment of programs for the storage and reproduction of auxiliary publications in support of journal editors; the operation of an Asian scientific literature service during World War II; support of Interlingua, an early rival of the artificial language Esperanto, to foster international science communications; and cosponsorship of the 1958 International Conference on Scientific Information.^[1–4]

1950s— Transition to Modern Information Science

As the number of people engaged in developing new principles and techniques in the many areas of documentation and information services increased, the Bylaws were amended in 1952 to admit individual as well as institutional members. Thus, ADI became the national professional society for those concerned with all elements and problems of information science. With the 1950s came increasing awareness of the potential of automatic devices for literature searching and information storage and retrieval. As these concepts grew in magnitude and potential, so did the variety of professional interests.^[1,4,5]

1960s—The Information Explosion

During the 1960s, the problems created by the “information explosion” gained national attention and ADI membership increased sevenfold. Reflecting this change in its total range of activities, as well as the emergence of information science as an identifiable configuration of disciplines, the membership voted to change the name of the ADI to the American Society for Information Science (ASIS). The name change took effect January 1, 1968 and emphasized the fact that the membership of ASIS was uniquely concerned with all aspects of the information transfer process. The new Society was a national professional organization with regional chapters for those concerned with designing, managing, and using information systems and technology. Harold Borko’s frequently cited article, *What Is Information Science?*, helped to define the field: “Information science is that discipline that investigates the properties and behavior of information, the forces governing the flow of information, and the means of processing information for optimum accessibility and usability. It is concerned with the body of knowledge relating to the origination, collection, organization, storage, retrieval, interpretation, transmission, and utilization of information.”^[6] One of the Society’s flagship publications, the *Annual Review of Information Science and Technology (ARIST)*, was launched in 1966, under the editorship of Carlos A. Cuadra and with support from the National Science Foundation. Contributors to *ARIST* provided overviews and syntheses of research on contemporary topics.

1970s—The Move to Online Information

The transitions from batch processing to interactive computing and from mainframe to mini- and microcomputers accelerated in the 1970s. Traditional boundaries among disciplines began to fade; many library schools and some departments of computer science added “information” to their titles. In 1974, the Society’s *Newsletter* became the *Bulletin of the American Society for Information Science*, a mainstay membership publication of the Society. During this decade, ASIS made the midyear meeting an annual event that focused on a single topic of current interest. In 1976, the Society sponsored a bicentennial conference on the role of information in the development of the United States. From 1970 to 1974, ASIS administered the ERIC Clearinghouse on Library and Information Sciences; the Society was also an active participant in the planning and implementation of the 1979 White House Conference on Library and Information Services.

1980s—Personal Computers Change the Market

By the 1980s large databases, such as MEDLINE at the National Library of Medicine, and user-oriented services,

such as Dialog, SDC, and CompuServe, were for the first time accessible by individuals from their personal computers. ASIS added to and revised its SIGs to respond to the changes, establishing groups on office information systems and personal computers as well as international information issues and rural information services. By the end of the decade, SIGs had been formed and reformed to represent various interests, including nonprint media, social sciences, energy and the environment, and community information systems, and ASIS had its first regional chapters outside of North America.

1990s and 2000s—The Human/Social Perspective

The social implications of information and communication technologies became increasingly apparent in the 1990s and ASIS responded. Ann Prentice’s “environmental scan” identified key topics that were expected to reshape work and the workforce, including public access to and ownership of information, internationalization, and increasing expectations of information technology. Themes that appeared regularly in the Society’s *Bulletin* and at national meetings included information management, globalization, intellectual property, computer networks (National Research and Education Network, the Internet), the digitization of text and visual information, bibliometrics, information retrieval, and human-information interaction. Interest in the representation of information found new applications in, for example, markup languages, taxonomy, metadata, and information architecture. The understanding of information retrieval was broadened and deepened by such developments as hypertext, the World Wide Web, search engines and browsers, and the addition of new domains to the Text Retrieval Conferences.

ASIS experienced changes in its own use of information technology. Merri Beth Lavagnino introduced the ASIS-L LISTSERV in 1992. The Society created its first website in 1995;^[7] it was chosen as a Yahoo! “Pick of the Day” in 1996. After considerable deliberation about making ASIS’s publications available electronically, a digital library was unveiled in 2006. In 2007, the *Bulletin of the American Society for Information Science and Technology* became an electronic-only publication.

The Society’s work reflected the increasing interest in social and historical aspects of information science in other ways as well. In 1991, it renamed and reoriented one of the SIGs to focus on the History and Foundations of Information Science, and in 1992, ASIS adopted its first professional guidelines. Conferences cosponsored with the Chemical Heritage Foundation on the History and Heritage of Scientific and Technical Information Systems were held in 1998 and 2002.

Reflecting both internal and external influences, the members changed the name in 2000, becoming the American Society for Information Science and

Technology (ASIS&T). President Eugene Garfield championed the change, calling attention to the importance of practical, information technology–focused programs. ASIS&T continued its annual meetings but discontinued the midyear meeting in favor of “summits” featuring topics such as information architecture, knowledge management, and digital archives for engineering and scientific research.

2010s—Connecting across Boundaries in the Digital World

New possibilities emerged with digital technologies, along with new socioeconomic challenges, and presentations at the Annual Meeting and papers published in *JASIST* and the *Bulletin* reflected this. Topics such as data analytics, research data archiving and sharing, information visualization, health informatics, crisis informatics, mobile information seeking, and collaborative information behavior emerged as new themes at the Annual Meeting and in *JASIST* and the *Bulletin*.

ASIS&T-sponsored webinars (digital audio and visual seminars) were introduced in 2010. Free to all members, the webinars provide synchronous and asynchronous learning opportunities. Typically 60 minutes in length, they address current topics and trends in information science such as metadata, search engine optimization, digital preservation, health informatics, research data archiving, web analytics, information architecture, and information visualization. Other webinars provide career coaching, such as advice on publishing in international journals, conducting blended learning courses, and mentoring. The webinars are conducted by individual members, affiliated groups, and SIGs.

In 2012, the membership voted overwhelmingly to change the association’s name from the American Society for Information Science and Technology to the Association for Information Science and Technology, keeping the acronym ASIS&T. The name change reflected the increasing global challenges that information science addresses and the increasing benefits from addressing these challenges collaboratively across sociopolitical and geographic boundaries. ASIS&T also increased its international activities, providing reduced membership fees based on gross national income per capita, establishing an Asia-Pacific Chapter, and holding its first annual meeting outside North America in 2016.

PURPOSE

The mission of the ASIS&T is to advance the information sciences and related applications of information technology by providing focus, opportunity, and support to information professionals and organizations.

The Association seeks to stimulate participation and interaction among its members by affording them an environment for substantive professional exchange. It encourages and supports personal and professional growth through opportunities for members to extend their knowledge and skills, develop and use professional networks, pursue career development goals, and assume leadership roles in the Association and in the broader information community. ASIS&T increases the influence of information professionals among decision makers by focusing attention on the importance of information as a vital resource in a high-technology age; in this way the organization seeks to promote informed policy on national and international information issues. It supports the advancement of the state-of-the-art and practice by taking a leadership position in the advocacy of research and development in basic and applied information science.

To accomplish these goals, ASIS&T edits, publishes, and disseminates publications concerning research and development; convenes annual meetings providing a forum for papers, discussions, and major policy statements; holds smaller local and special interest meetings, as well as special summits; and acts as a sounding board for the promotion of research and development and for the education of information professionals.

CHAPTERS AND SIGS

To give scope and focus to the diverse interests of its members, SIGs were established in 1966. These groups are, in effect, small professional organizations within ASIS&T, which encourage the discussion and development of both theoretical and practical issues. As of 2017, the Association’s 16 SIGs were Arts and Humanities; Classification Research; Digital Libraries; Education for Information Science; Health Informatics; History and Foundations of Information Science; Information and Learning Services; Information Needs, Seeking and Use; Information Ethics and Policy; International Information Issues; Knowledge Management; Management; Metrics; Scientific and Technical Information; Social Informatics; and Visualization, Images and Sound.

All ASIS&T members are automatically enrolled as members of the humorous and ironic SIG/CON, which seeks to “explore the fundamental notions of information science, and expose them for what they are.”^[8] The official SIG/CON website describes the initial meeting: “Those who stumbled into the first SIG/CON session found it to be one of the most informative and intellectually challenging sessions of the conference, a tradition which continues to this day.”^[8] Dr. Llewellyn C. Puppybreath, III, founder and perpetual chair of the group, has yet to appear at any of its meetings. The breadth of topics covered is evident in this list of titles

from presentations: “Baloonean Logic” by Ev Brenner, “Conical Classifications” by C. David Batty, “Titular Colonicity” by Candy Schwartz, and “Early Binary Separation: Implications for Information Retrieval (relevance judgments by identical twins separated at birth)” by Joseph Janes.

At a local and regional level, ASIS&T had, in 2017, 13 chapters in major cities and regions in the United States and around the world: Arizona, the Asia-Pacific Region, the Carolinas, Central Ohio, Europe, Indiana, Los Angeles, New England, New Jersey, Northern Ohio, the Pacific Northwest, Potomac Valley (Washington D.C. area), and Taipei. These chapters provide local forums for discussion and information exchange for members in a given locality.

In addition, 39 student chapters channel student interest and engagement in information science: the Catholic University of America, Drexel University, Europe, Florida State University, Indiana University, Long Island University, Louisiana State University, McGill University, North Carolina Central University, Pratt Institute, Rutgers University, San Jose State University, Simmons College, St. John’s University, State University of New York (Albany), State University of New York (Buffalo), State University of New York (Oswego), Taipei University, University of Alabama, University of British Columbia, University of California at Los Angeles, University of Denver, University of Hawaii, University of Illinois at Urbana-Champaign, University of Iowa, University of Maryland, University of Michigan, University of Missouri, University of North Carolina at Chapel Hill, University of North Texas, University of Pittsburgh, University of South Carolina, University of South Florida, University of Tennessee (Knoxville), University of Texas (Austin), University of Toronto, University of Washington, University of Wisconsin-Milwaukee, and Wayne State University. Additional regional and student chapters in South America and Africa are being established.

GOVERNANCE

The ASIS&T Board of Directors consists of the president, president-elect, immediate past president, treasurer, a parliamentarian, directors chosen by the SIGs and chapters, and six directors-at-large. ASIS&T maintains its headquarters under an executive director in the Silver Spring area in Maryland. The Association’s web address is www.asist.org.

The Executive and Budget and Finance committees are standing committees of the Board of Directors; the standing committees of the Society are Awards and Honors, Constitution and Bylaws, Information Science Education, International Relations, Leadership, Membership, Nominations, Publications and Scholarly

Communications, and Standards. An annual business meeting of the membership is held during the ASIS&T annual meeting.

The presidents of the Society have been the following:

PUBLICATIONS

Publication affords a major channel to communicate current significant research reports, development work, and professional activities, both to the membership and to the interested public. It also serves as a historical record of achievement. In addition to a substantial monograph series, ASIS&T produces three continuing publications.

The *Journal of the Association for Information Science and Technology* (*JASIST*, formerly the *Journal of the American Society for Information Science and Technology*) is a highly ranked and frequently cited source for reports of research and development in information science. The *Journal of Documentary Reproduction* (edited by Vernon D. Tate and published by the American Library Association, 1938–1942) is considered the predecessor of the Association's journal. In 1950, it was reborn as *American Documentation*. With the Association's changes of name, it became the *Journal of the American Society for Information Science* (in 1970), the *Journal of the American Society for Information Science and Technology* (in 2001), and the *Journal of the Association for Information Science and Technology* (in 2014). The journal, also known as *JASIST*, serves as a forum for new research in information transfer and communication processes in general, and in the context of recorded knowledge in particular. Concerns include the generation, recording,

distribution, storage, representation, retrieval, and dissemination of information, as well as its social impact and management of information agencies. *JASIST* consistently ranks at or near the top in assessments of influence in the field. It gradually increased from four issues per year (1950–1969) to its current monthly publication. The journal has been edited by Vernon D. Tate (1950–1951), Mortimer Taube (1952), Jesse H. Shera (1953–1960), Luther H. Evans (1961), James D. Mack (1962–1963), Arthur W. Elias (1964–1976), Charles T. Meadow (1977–1984), Donald H. Kraft (1985–2008), Blaise Cronin (2009 to date), Blaise Cronin (2009–2015), and Javed Mostafa (2016 to date).

The proceedings of the annual meetings collect significant contributed, peer-reviewed papers. Since 2002, these proceedings are available to meeting registrants and digitally through the ASIS&T Digital Library and the Wiley Online Library. All *JASIST* issues are also available in the ASIS&T Digital Library.

The *Bulletin of the American Society for Information Science* (formerly the Society's *Newsletter*) began publication in 1974. It is a bimonthly news magazine focused on developments and issues affecting the field, pragmatic management reports, opinion, and news of people and events in the information science community. Irene Travis was named editor in 1997; in 2007, the *Bulletin* became a digital-only publication. It is currently available free of charge via the ASIS&T website.

A fourth publication, the highly regarded *ARIST* was published from 1966 to 2011. *ARIST* surveyed the landscape of information science and technology, providing the reader with an analytical, authoritative, and accessible overview of recent trends and significant developments. The initial volumes of this series were supported by a grant from the National Science Foundation. *ARIST* was edited by Carlos A. Cuadra (1966–1975), Martha E. Williams (1976–2001), and Blaise Cronin (2002–2011). Many *ARIST* volumes are available in the ASIS&T Digital Library. The *Advances in Information Science* series published in *JASIST* continue the *ARIST* tradition of in-depth reviews of the field.

MEETINGS

Both the annual meeting held in the fall of the year and the special summits provide important forums for communication among people with diverse interests. The annual meetings bring together researchers and professionals from virtually every field: attorneys, bankers, electronic and print publishers, government officials, businesspersons, librarians, educators, engineers, social scientists, information managers, computer scientists, and many others. Activities specially held for students include a student design competition, student paper awards and presentations, a doctoral colloquium, and a newcomer's

brunch. The topical summits feature presentations from research and industry leaders, opportunities for extensive personal interaction, and awards recognizing excellence in all aspects of the field.

SIGs also organize and present specialized meetings. The SIG on Classification Research has conducted the highly regarded Workshop of Classification Research each year since 1990. The SIG on Information Needs, Seeking and Use holds a research symposium in conjunction with ASIS&T annual meetings. Other SIGs that periodically hold seminars and workshops include the SIG on Metrics, the SIG on Social Informatics, and the SIG on Knowledge Management. In 2012, a one-day seminar on international perspectives on the history of information science and technology was held to help celebrate ASIS&T's 75th anniversary. (Seminar co-chairs were Toni Carbo and Robert Williams.)

AWARDS

ASIS&T's Award of Merit is the Association's highest honor. It is bestowed on individuals who have made noteworthy contributions to the field of information science, including the expression of new ideas, the creation of new devices, the development of better techniques, and outstanding service to the profession of information science. The Watson Davis Award commemorates the Society's founder. It is given to members who have shown outstanding continuous contributions and dedicated service to the ASIS&T. The recipients of these awards are listed in Table 1.

Twelve additional awards are given annually to recognize students, academics, and practitioners for their contributions to information science education, research, and the Association. There are six chapters and three SIG awards presented annually as well.

CONCLUSION

ASIS&T has responded to more than seven decades of change in our understanding and use of information technologies. It has evolved from an organization of institutions to an individual membership society. As ASIS&T advances into the twenty-first century, its meetings reach academic, industry, and professional audiences, and its long-standing publications retain their high impact as they expand to digital formats.

The text describing the history of ASIS&T through the 1980s can be found on the ASIS&T website and is used with permission from ASIS&T. An earlier version of this article appeared in Davis, C.H.; Shaw, D. *American Society for Information Science and Technology (ASIS&T). Encyclopedia of Library and Information Sciences*; Taylor & Francis, 2009, DOI: 10.1081/E-ELIS3-120044410.

Association for Information Systems (AIS)

William R. King

University of Pittsburgh, Pittsburgh, Pennsylvania, U.S.A.

Dennis Galletta

Katz Graduate School of Business, University of Pittsburgh, Pittsburgh, Pennsylvania, U.S.A.

Abstract

The Association for Information Systems (AIS) is a professional organization whose membership is made up primarily of business school academics who specialize in information systems (IS) development, implementation, and evaluation. The current membership is 3965, which is over 50% saturation of the overall population of an estimated 7000 IS academics worldwide.

The Association for Information Systems (AIS) is a professional organization whose membership is made up primarily of academics who specialize in information systems (IS) development, implementation, and evaluation. As the majority of early academics in the field were housed in business schools, much of our research still has a focus on the “bottom line”—the business consequences of IS choices. This special perspective is reflected in the mission statement of AIS:

To advance knowledge in the use of information technology to improve organizational performance and individual quality of work life.

Worldwide, most recently, there are also many members housed in computer science and information science programs as well, but the organizational perspective remains.

OBJECTIVES OF AIS

The purpose of AIS is to serve as the premier global organization for specialists in IS in order to:

- Create and maintain a professional identity for IS educators, researchers and professionals, researchers, and educators;
- Promote communications and interaction among members;
- Provide a focal point for contact and relations with bodies in government, the private sector, and in education that influence and/or control the nature of IS;
- Improve curricula, pedagogy, and other aspects of IS education;
- Create a vision for the future of the IS field and profession;
- Create and implement a modern, technologically sophisticated professional society;

- Establish standards of practice, ethics, and education where appropriate; and
- Include professionals worldwide.

To these ends, AIS conducts conferences and meetings, publishes books, journals, and other materials; cooperates with other organizations interested in the advancement and practice of IS, stimulates research; promotes high professional standards and promotes the growth of IS and the profession’s quality throughout the world.

BACKGROUND ON IS IN BUSINESS SCHOOLS

The IS area developed in business schools in the late 1960s with an initial focus on programming business applications of computers, often through the use of COBOL, a business-oriented computer programming language. This addition to business curricula was controversial with some faculty arguing that business students would never become computer programmers and others arguing that managers needed to be informed “end users,” to understand the nature of the tasks that analysts and programmers perform, and to develop a realistic awareness of the capabilities and limitations of computer “solutions.”

This programming emphasis rapidly shifted to one that emphasized the “fit” between computer systems and the business enterprise as illustrated by the development of planning processes for deciding how computer systems could best be used to aid in the achievement of business goals.

HISTORY OF AIS

In the early days of IS in business schools, most academics in the area came from other disciplines such as economics,

accounting, organizational behavior, operations research, and management science. Because of this, most IS academics had professional affiliations in other underlying disciplines. Thus, some did not see IS as a distinct professional field even though they were teaching and researching IS topics.

Nonetheless, as the field grew explosively in the 1970s and 1980s with ever-greater demands for new IS programs and class offerings, the notion of IS as a professional field of study and practice grew. Many IS academics saw the need for an organization that could represent the professional values and aspirations of IS business-school academics. Although the focus differs somewhat from region to region, the predominant approach was, and still is, to recognize the different needs of IS academics from those of faculty in computer and information science.

Interestingly, the first major effort in this direction came in 1980 with the creation of a major international research conference—the annual International Conference on IS (ICIS)—a nonprofit organization with a governing executive committee that was responsible for site selection and choosing the conference chair and other key positions for upcoming conferences. This conference was created through a grass-roots effort by senior IS academics, primarily from North America. It rapidly became a major focal point for the research interests of academics across the world.

As ICIS grew and prospered, various informal groups met there to discuss the need for a professional organization to more broadly represent the interests of IS academics. Several studies and surveys were conducted with mixed results and little action.

Finally, a study was planned by a group of senior people who met informally and commissioned Dr. William R. King, University Professor at the University of Pittsburgh to organize a task force to comprehensively study the issue of creating a professional organization, and to assess the level of support for the idea. King contacted numerous senior people to get their ideas; he found that they almost unanimously favored the creation of such an organization. So, rather than leading a study, King formed an organizing committee of about 40 senior academics from around the globe. While this group was creating the general design for a new organization, King attended academic conferences held by related professional organizations and regional IS conferences that had recently been initiated. At those conferences, he held information sessions to discuss the objectives of the proposed organization and to solicit ideas.

The organizing committee conducted an electronic constitutional convention to agree on a constitution for the new organization and appointed King to be its first Executive Director. Operating out of his university office with the help of his assistant and a doctoral student, he proceeded to solicit members and had a membership roster of 1800 charter members within 6 months. The charter

members elected King as the first President of AIS in an election that also filled various officer and council slots.

GOVERNANCE OF AIS

The Association for IS is led by a president who is annually elected from one of three world regions—the Americas, Europe and Africa, and Asia-Pacific—on a rotating basis. The governing Council is made up of elected functional vice-presidents and other officers and council members who are elected in the three world regions. There are also some appointed positions, such as secretary and treasurer. Thus, AIS is truly a global organization that can reflect the diverse interests and needs of business-school academics all over the world.

EVOLUTION OF AIS

The Association for IS was initially operated out of a single office at the University of Pittsburgh with only one part-time paid employee, King's administrative assistant, and many activities conducted by member-volunteers. In 1997, it became apparent that more professional management was necessary, and the Council circulated a request for proposals for a permanent site and staff. Georgia State University submitted the winning proposal and the organization operated from there, with Dr. Ephraim R. McLean of Georgia State as Executive Director for 10 years. Currently, AIS has a paid Executive Director and a small number of staff members and contractors to handle membership, conferences, technology, and finances. Some degree of outsourcing allows AIS to reduce its dependence on volunteers.

In spite of professionalizing many operations, AIS still involves a great deal of volunteer work. There are several elected positions, including that of the President (and Past-President and President-Elect), Regional Representatives, and VPs. The VPs cover technology, communications, chapters, meetings and conferences, Special Interest Groups (SIGs), member services, and accreditation. Holding one of these positions carries with it an expectation of traveling to one or two meetings per year, responding to communications throughout the office-holder's tenure, and, most importantly, being innovative, and responsive to emerging issues and challenges.

Special Interest Groups began to be created in 2001. In November 2000, VP of Member Services Dennis Galletta conducted a survey of 11 other professional associations, and AIS fortunately compared favorably to those associations when considering dues amount and services to members. One of the most striking services in many of those associations was in the area of SIGs, not yet offered by AIS at that time. After evaluating 12 proposals, a first slate of six were created. As of early 2009, there are 33 AIS

SIGs. Many SIGs serve as valuable resources to members, as many of them provide valuable research and teaching resources, as well as newsletters, pre-conference activities, and conference tracks. With funding (actual and in-kind) from AIS, SIGHCI (Human-Computer Interaction), Syracuse University, and the University of Pittsburgh, Council has just created the first *Transactions* journals: *AIS Transactions of HCI (TOHCI)*, edited by Dennis Galletta and Ping Zhang, and *AIS Transactions on Enterprise Systems (TES)*, edited by Norbert Gronau. If these journals are a success, Council will entertain proposals from other SIGs for further *Transactions*.

Given the costs inherent in AIS initiatives and operations, it is important for AIS to generate revenue to cover a wide range of activities. Fortunately, one of the most important AIS activities is that of conferences, which both provide benefits to members and generate funds for the Association. Currently, 70% of the \$1.6 million AIS budget is funded by conferences. Based on strategic planning exercises initiated by President Michael Myers in 2006, Council has begun to explore ways in which the organization can use its intellectual capital to fund more of the costs of AIS. The recent move to expand memberships to practitioners will also broaden our base of revenue.

Milestones in the Evolution of AIS

The details of the evolution of AIS, as well as its truly global nature, may best be characterized by describing the foci of each president's term. As well, such a description may provide a useful case-study of the creation and development of a successful academic professional organization. The accomplishments are not necessarily reflective of a particular president but of the timing of the milestone. In many cases, the initiatives were accomplished over several presidential terms. Also, the affiliations of the President at that time are provided; in some cases they have either moved to other universities or retired.

1995 (Bill King, University of Pittsburgh, United States of America)

Bill King's administration represented the culmination of a history of imagining and planning. As described earlier, years of discussion about creating the Association were put into place at that time. Initial meetings were held to determine what the name of the organization would be (which was surprisingly difficult because of the diverse language structures and cultures), what services it would provide, what its structure would be, and to develop a strategic plan for its future development.

King arranged for AIS to support existing nascent conferences in Europe and Asia (ECIS—European Conference on Information Systems; PACIS—Pacific Asia Conference on Information Systems) and asked Dennis Galletta to organize the Inaugural Americas Conference

on IS (AMCIS) in Pittsburgh in August of 1995. The strategy for the conference was for it be complementary to ICIS in being inclusive, with a higher acceptance rate than that of ICIS (which is normally significantly lower than 20%), and with more of a focus on teaching. The first AMCIS generated 239 paper submissions and 149 were accepted by the program committee (chaired by Hugh Watson of the University of Georgia), representing a 62% acceptance rate. The 587 attendees in that first Americas regional conference enjoyed keynote talks by Tom Davenport, Herbert Simon, and James Wetherbe.

Attendees enjoyed a dinner/dance riverboat ride on the three rivers of Pittsburgh to kick off the Inaugural Conference. Such amenities were common at ICIS and AMCIS carried on this tradition. The conference was innovative in several ways: it featured electronic submissions and reviewing, electronic registration via Web site, teaching workshops, technology briefings, tutorials, and software demonstrations. Since 1995, the conference has been held each year in August, and attendance has risen to around 1000 attendees as membership in AIS has risen to nearly 4000.

Before the Inaugural AMCIS conference was held, there was some controversy as some Council members feared that regional conferences would erode the popularity of ICIS, which was generally perceived to be of such high quality that it constituted a "crown jewel" of the field. The fears proved to be unfounded as ICIS continued to attract 1000–1500 participants, and as all regional conferences have prospered.

The Association for IS began by making arrangements with several existing journals to provide a discounted subscription to a journal of choice to each member. Currently, members deal directly with any of 32 journals and provide their membership number to obtain the discount.

1996 (Niels Bjorn-Andersen, Copenhagen Business School, Denmark)

President Bjorn-Andersen worked to make sure that AIS was established as a true global organization. When he took office, his main efforts were aimed at stimulating support in the various regions through traveling to the major regional conferences. His message was that the field needed a global organization, and that AIS was not exclusively run by Americans. He garnered more members from the non-American regions and worked to make sure that officers represented all regions.

Council established membership for researchers from developing countries at a very affordable level, and Bjorn-Andersen initiated a series of negotiations on enlisting already existing local IS faculty organizations as chapters.

He stimulated improvements in the faculty directory service and integrated a European directory of faculty into the global directory done so well by Dave Naumann and his colleagues at the University of Minnesota.

1997 (Ron Weber, University of Queensland, Australia)

Several key milestones were reached in 1997. The seeds for a merger of AIS, ICIS, and ISWorld were planted. Discussions were held about making the *MIS Quarterly* available to all AIS members electronically. Also, two electronic AIS journals were begun: *Journal of the AIS* and *Communications of the AIS*. The first editor of the *Journal of the AIS* was Philip Ein-Dor, and the first editor of the *Communications of the AIS* was Paul Gray, both of whom developed the journals into the highly-ranked publications that they are today. Key decisions that year include the formation of an audit review committee, keeping the new journals in an electronic-only format, the development of strategic planning for AIS, and the genesis of the first AIS chapter (Southeastern United States of America).

1998 (Gordon Davis, University of Minnesota, United States of America)

Much of the complexity involved in building a global association was exhibited in this time period, as many initiatives took several years to come to fruition. For example, merger discussions between AIS and ICIS reached a crescendo during 1998. Also, trying to normalize many conference procedures as AMCIS began to mature, and ICIS continued in its 19th year. Significant attention was paid to conference and AIS finances, as there were some difficulties with an outside contractor who handled funds and conference implementation. During this period, relationships were cultivated with organizations worldwide for potential alliances.

1999 (Bob Galliers, University of Warwick, United Kingdom)

During 1999, plans for new Lyons Electronic Office (LEO) and Fellow awards were drafted to honor contributors to the field. Named after the world's first commercial application of computing (The LEO), the purpose of the LEO Award is to recognize truly outstanding individuals in the IS community, both academics and practitioners, who have made exceptional lifetime contributions to research in and/or the practice of IS. As of 2009, 21 LEO awards have been conferred.

The AIS Fellow award recognizes individuals who have made outstanding contributions to the IS discipline in terms of research, teaching, and service. A Fellow need not have excelled in all three categories. Nonetheless, she or he is expected to have made exceptional contributions in at least one of these categories and to have made significant contributions in the other two categories. A Fellow is also expected to have made significant global

contributions to the IS discipline as well as outstanding local contributions in the context of their country and region. As of 2009, 48 Fellow awards have been conferred.

2000 (Mike Vitale, University of New South Wales, Australia)

During 2000, final consolidation of AIS and ICIS was planned. Attorneys drew up the necessary paperwork, and the AIS constitution and other legal documents were thoroughly reviewed and updated to reflect the new nonprofit corporate structure. Also, functions and procedures were refined for the office in Atlanta. Also that year, it was decided that a periodic member survey would be conducted and that AIS would become involved in curriculum and accreditation efforts.

2001 (Blake Ives, Louisiana State University, United States of America)

The consolidation of AIS and ICIS was finally completed and celebrated in New Orleans, Louisiana, in December 2001, complete with a wedding cake inscribed with "AIS + ICIS." Also that year, AIS became involved in *MIS Quarterly's* Policy Committee by having its VP of Publications as a member of the Committee, by appointing a member, and by choosing the Committee's chair every other term. Also, a contract was signed with *MIS Quarterly* and *MISQ Executive* to offer them both free to AIS members electronically. The Minnesota IS Faculty directory was integrated into the "ISWorld" online portal. That year, AIS responded formally to Association to Advance Collegiate Schools of Business, the premiere accreditation agency for academic business programs, which had omitted MIS from its business program accreditation guidelines; AACSB subsequently "fixed" its guidelines and added a requirement for business programs to include MIS. This one initiative has led several schools to create a required MIS course, or to make sure that the required course was retained despite any curriculum innovations. Heavy membership discounts were offered to IS academics in "non-rich" countries. Finally, AIS began studying accreditation as a possible avenue for program development.

2002 (Phillip Ein-Dor, Tel Aviv University, Israel)

Budgetary integration of AIS and ICIS was accomplished for the first time in 2002, which was largely accomplished by AIS Treasurer Richard Elnicki. Also, global geographical integration was encouraged. New affiliations were struck with German and French IS Societies. An agreement was reached with *MISQ Executive* to provide the journal electronically to all members. The electronic

version of the *MIS Quarterly* was built. Previous ICIS and AMCIS proceedings were also provided online.

2003 (K.K. Wei, National University of Singapore)

In 2003, memberships from Region 3 achieved a greater than twofold increase, thus making AIS into a truly global community. A large number of chapters were created in 2003, including new chapters representing Chinese-speaking individuals and also those spanning different continents including Europe (Ireland, Italy, Slovenia, and United Kingdom), Middle East (Israel and Morocco), and Asia (Pakistan). Wei initiated a new strategic planning function for AIS. A new Code of Research Conduct was adopted by the AIS Council. A member survey was undertaken, which indicated a high degree of member satisfaction. Particular areas were noted for future decision making.

2004 (Richard Watson, University of Georgia, United States of America)

In 2004, two successive losses exceeding \$200,000 underscored the importance of cost cutting. Establishing the financial viability of AIS monopolized action during this term. The budget was scrutinized, and the cycle of losses was turned into more than a \$100,000 surplus. A number of actions were taken to establish the long-term financial health of AIS, including an analysis of the operations of AIS by the Finance Committee, chaired by Joe Valacich, and a review of the financial contributions of AMCIS and ICIS by a committee chaired by Malcolm Munro, VP of Meetings and Conferences.

Also, AIS replaced its in-house Web site system with an open-source content management system to reduce costs and improve the currency of the site.

2005 (Claudia Loebbecke, University of Cologne, Germany)

The e-library was enhanced in 2005 by allowing cross-searching of all AIS conferences. Also, new conferences were added to the e-library (those from conferences in Australia/Asia (ACIS), Bled, and Europe (ECIS)). Internationalization efforts continued, and hundreds of new members from China marked the success of that initiative. Also, membership fees in developing countries were lowered again to broaden the membership of AIS. The open source Web site was implemented. Model curricula were approved in conjunction with IEEE and ACM. The Distinguished Member award was initiated for honoring deceased members. As of 2008, there are three such members (Claudio Ciborra, Gerardine DeSanctis, and Heinz Klein). Finally, a new conference management firm was appointed to help with conference negotiation, planning, and execution.

2006 (Michael Myers, University of Auckland, New Zealand)

In 2006, a key event was a strategic planning meeting for AIS Council to provide a clear vision and direction for the future growth and development of AIS. This meeting marked the inauguration of a firm strategic planning function within AIS. Strategies were developed by AIS Council for internationalization, communications, journals, chapters and SIGs, conferences, accreditation, corporate sponsorship, and membership growth, amongst other things. Council developed a vision to transform AIS into a more professional association. An orientation program was established, whereby all new Council members are introduced to the principles of association leadership, the state of the association, the strategic plan, and the opportunities and challenges of their particular role whether it be vice-president or region representative. The AIS Technology Committee met and had its own strategic planning session. Recommendations that were adopted by AIS Council were the following: 1) Scholar One was adopted as the electronic review system for all AIS journals and conferences; 2) A revamped AIS Web site was launched, including regularly updated content on AIS SIGs and chapters; and 3) AIS Council agreed to fund an AIS association management system, an AIS e-library system and to bring together into one unified portal the AIS Web site and AISWorld. An affiliation of *Information Systems Journal* with AIS was approved. Two new journals were launched: an AIS Journal in Spanish and the Pacific Asia Journal of the AIS. Finally, a VP of Technology was introduced and the position filled by presidential appointment.

2007 (Dennis Galletta, University of Pittsburgh, United States of America)

During Galletta's term, a task force explored how to increase membership value and another worked on issues of member diversity. In a bold move to increase membership, Council decided to include practitioners as an important additional membership category. This move enables student chapters to provide a "membership path" for future members, and for graduates to serve as contacts for us and our current students. We also adopted a German language journal into the e-library, and Council insisted that full German text be included rather than only incorporate English abstracts. To address the enrollment downturns that had been experienced in the early twenty-first century, a committee maintained an AIS wiki for storing materials and strategies for student recruitment. A brochure "Picture yourself studying IS" was created for co-branding with interested schools. Further, a student video competition was held, and a Second Life half-island was purchased. To increase value to members, an AIS

discussion forum was created entitled “What in the World can AIS do for you?” AIS adopted the Senior Scholars’ “Basket” of six top IS journals and featured it prominently on the AIS Web site. Including six journals in the basket was seen as a solution to enhance the promotability of academics in a relatively new field in which the quality assessments of journals was previously highly variable across universities. The basket includes our own *Journal of AIS*, providing welcome recognition of the journal’s quality. Finally, the AISWorld and AIS Web sites were integrated based on a design contest that was won by Dave Haseman and Craig Claybaugh of University of Wisconsin at Milwaukee.

THE FUTURE OF AIS

The next two Presidents as of 2009 are David Avison (2008) of ESSEC Business School in Paris, and Bernard Tan (2009) of National University of Singapore. The member initiative, run by David Avison during 2007, and continued by Bernard Tan after Avison took over as President in July 2008, is a key component in determining the future of AIS. He has found that there is no shortage of ideas for extending the impact of AIS and broadening its reach. As of early 2009, the current membership is 3965, which is estimated to be over 50% saturation of the overall population of an estimated 7000 IS academics worldwide. Tables 1–3 provide details of the current AIS membership.

Conferences, journals, and associations are contacting AIS on an accelerating basis to explore partnering or merger. The international organization is taking on more regular roles in providing AIS plenary presidential addresses to all three regional conferences (AMCIS, ECIS and PACIS) in addition to ICIS. The Association for IS’

intellectual capital is recognized to be one key to improving the ability of AIS to become more self-sustaining and to reduce fund-raising pressure on conferences.

The Association for IS has come a long way from having nearly all operations completed by volunteers to having a professional staff and bank of consultants. The “professionalization” of the office has been gradual but dramatic. Memberships have grown over the years on a healthy basis. The decision to include practitioner members and student chapters should take AIS to a new level.

Association for Library Collections and Technical Services

Charles Wilt

Association for Library Collections and Technical Services (ALCTS), Chicago, Illinois, U.S.A.

Abstract

The Association for Library Collections and Technical Services (ALCTS) is one of the 11 divisions of the American Library Association (ALA). In 1957, this division was established from the merger of several ALA units with common interests. It was called the Resources and Technical Services Division until 1989 when the present name was approved by the membership. ALCTS focuses on six areas: standards, best practices, publications, continuing education, professional development, and information exchange.

INTRODUCTION

The Association for Library Collections and Technical Services (ALCTS) is responsible for the following activities: acquisition, identification, cataloging, classification, and preservation of library materials, the development and coordination of the country's library resources, and those areas of selection and evaluation involved in the acquisition of library materials and pertinent to the development of library resources. ALCTS has specific responsibility for

1. Continuous study and review of the activities assigned to the division
2. Conduct of activities and projects within its area of responsibility
3. Synthesis of activities of all units within the American Library Association (ALA) that have a bearing on the type of activity represented
4. Representation and interpretation of its type of activity in contacts outside the profession
5. Stimulation of the development of librarians engaged in its type of activity, and stimulation of participation by members in appropriate type-of-library divisions
6. Planning and development of programs of study and research for the type of activity for the total profession

DESCRIPTION

Vision

ALCTS is the recognized dynamic leader and authority for principles, standards, best practices, continuing education, and new developments in the selection, management, and preservation of all information resources.

Mission

To shape and respond nimbly to all matters related to the selection, identification, acquisition, organization, management, retrieval, and preservation of recorded knowledge through education, publication, and collaboration.

ALCTS is one of 11 divisions of ALA. With about 3500 personal, organizational, and international members, ALCTS represents a wide range of the library community, public, academic, and special. Members of ALCTS have the opportunity of joining one of five sections: Acquisition (AS), Cataloging and Metadata Management (CaMMS), Collection Management (CMS), Preservation and Reformatting (PARS), and Continuing Resources (CRS). Each of these sections represents specific areas of interest within ALCTS and offers members an opportunity to meet and discuss issues, trends, and developments with others with similar interests.

A staff of three, who specialize in specific areas, manages ALCTS, which supports the ongoing work of the association. The Executive Director is responsible for the overall management and fiscal health of the association. Other staff oversee the website, continuing education, programming, meeting management, publications, and membership.

Products, Services, and Member Benefits

The association focuses on six areas: standards, best practices, publications, continuing education, professional development, and information exchange. Within these six areas, ALCTS offers products and services for librarians throughout their careers.

Standards

The purpose of ALCTS is to develop, evaluate, revise, and promote standards. Standards are vital to the organization

of information, such as metadata standards, cataloging revisions, resource description and access (RDA), and preservation. Through its own committee structure and liaison work with outside organizations, ALCTS members make a significant impact. ALCTS appoints the ALA representative to the National Information Standards Organization (NISO), who informs the association of critical changes in U.S. and international standards.

Best Practices

The association is the authority on many vital issues confronting libraries today. Its members provide input to national bodies such as ALA on practices and programs relating to technical services.

Publications

The association publishes outright or has significant input into many of the crucial publications in technical services including RDA and the Library of Congress subject headings. The ALCTS publications cover the range of our interests from e-publications to monographs to directories to guides. *Library Resources & Technical Services (LRTS)*, ALCTS quarterly research journal, consistently ranks as one of the premier research journals in library technical services. The *ALCTS News*, a timely news source, keeps the membership informed of the activities of the association.

Continuing Education

Substantial and high-quality conference programming including outstanding preconferences is offered by ALCTS. The association offers nearly 12–15 programs on a variety of topics at each ALA Annual Conference. ALCTS offers web-based continuing education on a broad array of topics. The ALCTS e-Forum brings a monthly discussion of current topics to over 4000 subscribers.

Professional Development

ALCTS offers great opportunities for members to increase their knowledge and further their professional careers. Besides serving on committees, there are opportunities to work with outside groups and organizations in developing important policies for the library community. Members represent the library community on the RDA Steering Committee, the Program for Cooperative Cataloging, and the NISO.

Information Exchange

There are forums for the exchange of information among members and nonmembers. Twice a year, at the Midwinter Meeting and the Annual Conference, over 40 topical

interest groups meet to address some important issues facing the library community. There are numerous electronic discussion lists available for subscription.

HISTORY

ALCTS has been a division of ALA since 1957, when the Resources and Technical Services Division (RTSD) was formed from the merger of several ALA units with common interests. In 1989, the membership of RTSD voted to change the name of the division to ALCTS. It was during this same period that ALCTS began a cooperative shared staffing arrangement with the Library Administration and Management Association. This shared staffing arrangement lasted over a decade. In January 2001, the boards of each division approved the dissolution of the arrangement effective September 1, 2001. The first bylaws for RTSD provided for four sections: Acquisitions, Cataloging and Classification, Copying Methods, and Serials. In 2007, ALCTS celebrated its 50th anniversary as a division of ALA. In 2014, ALCTS celebrated the 25th anniversary of the name change from RTSD to ALCTS.

The Acquisitions Section was formed from the Board on Acquisition of Library Materials, created in 1951. In 1973, the Resources Section was formed by the merger of the RTSD Resources Committee and the AS. In 1991, the Resources Section changed its name to Acquisition of Library Materials Section, and some of its committees were assigned to a newly formed Collection Management and Development Section (CMDS). In 1992, the section again adopted the name Acquisitions Section.

CaMMS dates from 1900 when the Cataloging Section of ALA was founded. In 1940, the section became the Division of Cataloging and Classification (DCC). The DCC included a Council of Regional Groups, formed by Margaret Mann in 1923.

The Copying Methods Section became the Reproduction of Library Materials Section in 1967. This section dates to 1936, when the Committee on Photographic Reproduction of Library Materials was created. In 1948, the committee changed its name to Committee on Photoduplication and Multiple Copying Methods. This committee was replaced by the Copying Methods Committee, which joined RTSD as the Reproduction of Library Materials Section in 1957. In 1994, the section merged with the Preservation of Library Materials Section (PLMS) to form the PARS.

The CRS has its origins in the Serials Round Table formed in 1929.

In 1980, the original four sections were joined by the PLMS, in recognition of the growing awareness and knowledge of preservation issues. In 1994, PLMS merged with the Reproduction of Library Materials Section to form the PARS.

GOVERNANCE

Bylaws

The ALCTS bylaws govern and guide the association. In its 17 articles and numerous subsections, the bylaws lay out the essence of ALCTS.

Board of Directors

A 19-member Board of Directors governs ALCTS. The board has authority over the affairs of ALCTS. It sets the policies and programs of the association in relationship to the goals and objectives identified by the membership and by ALA. The Board of Directors is composed of voting and nonvoting officers and members. These officers and members have particular duties as set forth in the ALCTS bylaws. The voting members of the board include the president, president-elect, past-president, ALCTS councilor to the ALA Council, three directors-at-large, the chairs of the sections of ALCTS, and the chairs of the Budget and Finance Committee, the Organization and Bylaws Committee, the Planning Committee, and the Affiliate Relations Committee. The ALCTS Executive Director, the editor of the ALCTS News, and the board Intern are ex officio nonvoting members.

The Executive Committee of the board meets to plan or carry out actions resulting from previous board action, to review financial matters of the association, and to plan future board action. The Executive Committee is composed of the president, president-elect, past-president, councilor, and the Executive Director.

Each of the five ALCTS sections is governed by its own executive committee, which is elected by its membership. The chair of the section serves on the ALCTS Board of Directors.

STRATEGIC PLAN

In 2015, the ALCTS Board reviewed and approved a revised strategic plan. This plan guides the association in the development and implementation of a wide range of activities, policies, and goals.

ALCTS Strategic Plan 2015

Adopted June 26, 2015

Preamble

This 3 yr strategic plan was developed by the ALCTS Planning Committee and approved by the Board of Directors at the 2015 ALA Annual Conference. The plan,

similar in design to its 2011 predecessor, is not meant to encompass the whole of ALCTS activities, but rather those areas where increased focus is needed. The plan is fluid, that is, achieved objectives may roll off the plan prior to its expiration, while emerging areas of strategic importance may be added as warranted. The Planning Committee will make such recommendations to the Board of Directors annually, and the plan will be updated accordingly. The strategic plan in its entirety will be reviewed and updated during the 2017–2018 term with the expectation that a new plan will be approved at the 2018 ALA Annual Conference.

1. Increase awareness of the ALCTS mission and activities to outside groups.
 - a. Raise awareness of our mission and our contributions to the profession.
 - b. Strengthen advocacy for user access to resources and information.
2. Increase participation in ALCTS activities.
 - a. Encourage a culture of year-round participation in meetings in all formats.
 - b. Expand opportunities for virtual members to participate in the association's activities.
 - c. Reach out to underrepresented and underinvolved groups (support staff and students) to encourage their participation in webinars and online meetings.
3. Develop ALCTS as a vibrant, relevant organization.
 - a. Give special attention to member retention.
 - b. Develop a culture of continuous review and examination of programs and services to maintain relevance.
 - c. Recruit new members, particularly students and faculty in iSchools and library programs, and public and special librarians.
 - d. Identify and address requirements for the financial sustainability of ALCTS, particularly fund-raising.

Financial Plan

A sound and responsible financial base that is derived from a broad range of revenue streams supports ALCTS' vision and mission. Planning and management of ALCTS' financial resources ensures the association's fiscal health.

The environment in which ALCTS operates is distinguished by a rapidly changing technology; a level-declining and changing membership base; increased opportunities in nontraditional library fields; changing member expectations and types of involvement; increased competition; increasing the number of initiatives requiring sophisticated technology; changing attitudes of leaders and potential members about how the association operates; evolving staffing patterns, levels, and responsibilities within acquisitions, cataloging, serials,

preservation, and collection development areas; an increased need for practical staff training; and an increased international influence.

In response, ALCTS recognizes the need to ensure efficient use of association resources through a continued sound and broad-based financial infrastructure to support its broad-based activities and initiatives. Providing the necessary revenue and staff to support important standards-driven programs and community-based programs is crucial in supporting ALCTS interests in relevant standards-based activities in the United States, internally within ALA and externally in cooperation with other library organizations and internationally working with the International Federation of Library Associations and Institutions (IFLA). Membership recruitment and retention is the foundation upon which any association is based. ALCTS strives to increase its membership revenue and membership base by providing diverse opportunities, creating services that appeal to staff who have paraprofessional library positions, exploring ways to attract nonlibrary information management professionals, and focusing membership campaigns on ALCTS new and existing programmatic areas. Continuing education and professional development programs offer reliable and consistent revenue, in addition to supplementing the career advancement of library professionals and paraprofessionals. A key to any financial plan is a well-rounded publishing endeavor. This informs members and nonmembers of current trends and issues in librarianship and enables ALCTS to maintain a high visibility.

Revenue growth and fiscal responsibility ensure that ALCTS has the resources to continue to develop programs and services for its members in the long term.

THE DIVISION

Committees

Committees of ALCTS support the operation of the association, produce revenue through publications and continuing education, support the advocacy of the association in areas of interest, and provide a forum for members and nonmembers on a wide variety of topics. Association-wide committees give operational support to ALCTS, produce the products and services ALCTS is known for, provide a forum for the discussion of trends and issues important to the library community in ALCTS areas of interest, and help to promote and develop ALCTS members and leaders. These committees fall into four broad areas: operational, revenue, advisory, and topical.

Operational Committees

The operational committees of ALCTS advise, recommend, implement, and guide the association. The Budget

and Finance Committee, which is primarily responsible for the fiscal health of the association, reviews, approves, and recommends acceptance of the ALCTS annual budget. This committee performs budget analyses and fiscal planning based on the ALCTS financial plan. It advises all ALCTS groups on fiscal matters, including fiscal implications of all division publications and programs. The Organization and Bylaws Committee advises the Board of Directors and through it the association on the establishment, functions, and discontinuance of sections, committees, and other groups as the needs of the association may require. It reviews documents and practices and advises the officers of the association and its sections on the bylaws, policies, and procedures of the association. It has authority on questions of the bylaws and any amendments needed to that document. With the adoption of the ALCTS Strategic Plan and the continuing planning efforts, the Planning Committee is a key contributor to the operations of ALCTS. It oversees this planning effort by continually updating the strategic issues, by coordinating the planning initiatives of the association and its sections, and by informing the ALCTS leadership through workshops and announcements on planning in general.

Revenue Committees

The ALCTS Revenue Committees are Continuing Education, Fund-raising, Membership, Program, and Publications. Each has a specific charge and area of responsibility. The Continuing Education Committee oversees the association's programs outside the conference setting. It develops criteria for continuing education, reviews continuing education plans, recommends approval of continuing educational offerings, and researches the educational needs of library staff at all levels in the areas supported by ALCTS. The Fund-raising Committee establishes fund-raising goals and priorities that support the association's strategic and financial plans. It also secures financial and in-kind support for ALCTS activities and further develops relationships with the commercial and private sectors. The Membership Committee is charged as the primary resource to the development and implementation of a continuous campaign to recruit and retain members for ALCTS (see Membership section). The Program Committee oversees the conference and preconference program planning, recommending a slate of programs to the board, and provides advice to those planning programs and preconferences. It is the work of the Publications Committee that produces the range of monographic and serials publications. This committee coordinates the association's publication program and provides a forum for discussion of the editorial policy for ALCTS' serial publications.

Advisory Committees

There are a number of committees whose purpose is to monitor trends and issues outside ALCTS, provide for the professional development of ALCTS members, and offer a forum to discuss research: Advocacy and Policy, Standards, Affiliate Relations, International Relations, Leadership Development, and *LRTS* Editorial Board. International Relations recommends members to serve on international committees, particularly within IFLA, and to monitor international developments. Leadership Development is responsible for the professional development of ALCTS member leadership through orientation and leadership training. The *LRTS* Editorial Board advises the editor on matters relating to editorial policies and journal content and assists in the selection of contributors and the evaluation of manuscripts. The Standards coordinates ALCTS input, development, and information on the wide range of standard-producing organizations. Affiliate Relations is the primary contact group with state and regional technical services organizations. Advocacy and Policy purpose to monitor state, national, and international advocacy and public policy developments and issues.

INTEREST GROUPS

The informal discussion of developments, trends, and issues is supported by ALCTS through its interest groups that are managed by the Interest Group Coordinator. Any group of ten or more members of ALCTS, for divisional groups, or section, for those interested in discussing common problems, which fall within the interests of ALCTS or the section, may form an interest group upon written petition, describing the purpose of the group, and upon approval of the Section Executive Committee or ALCTS Board. The petition shall include the requirements for membership. The ALCTS interest groups offer the library community a forum to explore a variety of topics and that addresses the needs of technical services professionals at different levels and in different types of libraries. The ALCTS interest groups include

- Creative Ideas in Technical Services
- Electronic Resources
- Electronic Resources Management
- Functional Requirements for Bibliographic Records
- Linked Library Data
- MARC Formats Transition
- Metadata
- New Members
- Newspaper
- Public Libraries Technical Services
- Publisher–Vendor–Library Relations
- Role of the Professional Librarian in Technical Services
- Scholarly Communication

- Technical Services Managers in Academic Libraries
- Technical Services Directors of Large Research Libraries
- Technical Services Workflow Efficiency

For information on section level discussion groups, visit each section's website listed under "Sections."

SECTIONS

The five ALCTS sections, AS, CaMMS, CMS, CRS, and PARS, are important contributors to the association. Through the sections, members of ALCTS have an opportunity to interact with other members who share common interests and concerns. The sections consider issues, trends, and policies related to their specific area of expertise. The sections produce programs and publications and in many cases serve as the voice of ALCTS on a variety of matters that go beyond ALCTS. Any group of 50 or more members of ALCTS or of ALA, whose interest falls within ALCTS but is distinct from that of any existing section, may be established as a section upon written petition, and upon approval by the association. The name of the new section must clearly indicate its field of activity. Each section defines its own functions and manages its own affairs, provided, however, that no section shall adopt bylaws or other rules for the transaction of its business that are inconsistent with those of ALCTS or engage in any activity in conflict with the activities of ALCTS. Each section is governed by an executive committee, which is elected yearly by its members. The chair of the section serves on the ALCTS Board of Directors.

Acquisitions Section

This section is dedicated to acquisition and associated bibliographic control for all formats of information resources through purchase, lease, and other access methods and in all types of libraries.

The AS does this through programs and publications specifically targeted to library staff whose primary responsibility is acquisitions and related areas. Members of AS can contribute through a number of committees and discussion groups within the section. Each year, the AS presents the HARRASSOWITZ Leadership in Acquisitions Award to a person who has shown outstanding leadership in the field of acquisitions. The committees of AS are Acquisitions Organization and Management, Education, Leadership in Library Acquisitions Award, Policy and Planning, Publications, Research and Statistics, and Technology.

Cataloging and Metadata Management Section

CaMMS' primary focus is on providing leadership to the library community on cataloging, metadata and related

discovery, and access issues through encouragement and promotion of activities relating to all formats and to all types of institutions. CaMMS does this not only through programs and publications but also as a significant contributor to the revisions of cataloging rules and metadata standard policies nationally and internationally. The Committee on Cataloging: Description and Access and the Subject Analysis Committee, representing a broad range of ALCTS members, ALA units, and national and international organizations, advise regularly on the structure and function of the foundation tools the library community utilizes to make information accessible to its users. The prestigious Margaret Mann Citation, given yearly to the person who has made superlative contributions to cataloging and classification, is presented by CaMMS. Its members have the opportunity of serving on these other CaMMS committees, Cataloging: Asian and African Materials; Cataloging of Children's Materials; Continuing Education; Research and Publications; Recruitment and Mentoring; and Policy and Planning. In addition to the committees, CaMMS supports numerous task forces, subcommittees, and six discussion groups.

Collection Management Section

The CMS contributes to the library community in all matters relating to collection management and development, selection, and evaluation of library materials in all types of institutions. It does this through interest groups, which address administration, electronic resources, practical issues, and evaluation and assessment for collection management. Other interest groups aim at collection management professionals at varying levels of management in three distinct library organizations: Chief Collection Development Officers of Large Research Libraries, Collection Development Librarians of Academic Libraries, and Collection Management in Public Libraries. The CMS gives one award: the ProQuest Coutts Award for Innovation. Members can gain valuable experience by serving on one of CMS' committees: Continuing Education, Planning, and Publications.

Continuing Resources Section

The CRS has its role in fostering the importance of serials through the distribution of information concerning serials, through open discussion of the trends and issues of serials, and through publications. The CRS seeks to encourage specialized training for librarians and other library staff in the field of continuing resources and supports the need for a serials curriculum. The CRS gives two awards: the Ulrich's Serials Librarianship Award for superior serials librarianship and the First Step Award, a Wiley Professional Development Grant, to new librarians committed to serials librarianship. Members of the CRS have many opportunities to participate in the section, including

committees and discussion groups. The CRS committees are Acquisitions, Education, Research and Publications, Continuing Resources Cataloging, Policy and Planning, Standards, and Holdings Information. The two interest groups are College and Research Libraries and Access to Continuing Resources.

Preservation and Reformatting Section

The PARS provides leadership in the areas of librarianship relating to the preservation and reformatting of library materials in all types of institutions and in the application of new technologies to assure continued access to library collections. It is most noted for the Preservation Administrators Interest Group (PAIG), which serves as one of the most prominent communication vehicles for preservation staff in the country. The PARS has three awards: Paul Banks and Carolyn Harris Preservation Award, the George Cunha and Susan Swartzburg Award, and the Jan Merrill-Oldham Professional Development Grant. PARS members are responsible for revising the ALA Preservation Policy, one of ALA's major policy statements for the library community, adding digital preservation to the policy in 2008. The PARS provides members with many opportunities to serve and influence the preservation community. Its interest groups include Books and Paper, Intellectual Access, Digital Conversion, Digital Preservation, and Promoting Preservation. Its committees include Program, Planning, and Publications, and Preservation Standards and Practices. It has 1000 members.

PUBLISHING

ALCTS publishing is a diverse effort from serials to monographs, from web publications to "best practices." Publications cover all the areas of ALCTS interest: acquisition, cataloging and classification, collection management and development, preservation and reformatting, and serials.

Library Resources & Technical Services

Established in 1957, *LRTS* is the official electronic quarterly journal of ALCTS supporting the theoretical, intellectual, practical, and scholarly aspects of collection management, acquisitions, cataloging and metadata, preservation and reformatting, and continuing resources, by publishing articles (subject to double-blind peer review), book reviews, editorials, and correspondence. Each issue includes reports of current, ongoing research on technical services, and related issues. The articles serve as the record of scholarly communication in the field. *LRTS* is one of the most frequently cited journals in the field. *LRTS* includes shorter notes reporting unique and evolving technical processes and research methods and substantive

book reviews on new publications. *LRTS* is read by librarians in all types of libraries worldwide.

ALCTS News

The *ALCTS News* is the primary public communications voice of the association. Published as a continually updated news source, *ALCTS News* features the association's news, committee and discussion group reports, reports of programs and preconferences, election results, informative editorials, and related news. *ALCTS News* is free to anyone interested in ALCTS activities, products, services, and news.

Guides Series

The Guides series, acquisitions and collection management, offers "best practices" and "hands-on" information on a variety of topics across ALCTS.

Sudden Selector's Guides

This series helps library workers get familiar with new subject areas by covering the tools, resources, people, and organizations they will need to keep collections relevant.

Monographs Collection

The Monographs Collection publishes relevant monographs on highly relevant topics of interest to the library community.

z687

z687 is an online collection of white papers and think pieces by library technical services professionals for their peers. This publication series has been discontinued.

MEMBERSHIP

ALCTS has 3500 members representing all types of libraries and library staff. Although personal members account for most of the membership, ALCTS also has 420 organizational and corporate members. Many members belong to at least one section. Section membership is free and members can join as many sections as they wish.

CONTINUING EDUCATION AND PROGRAMMING

In this era of rapid change, the need for many quality venues for Continuing Education and Programming (CE) is critical. Targeted, affordable, and accessible CE is one of the most requested benefits of members. This requires CE offerings to be both practical and theoretical,

providing basic information on a variety of topics for the beginner, but also providing advanced information for the seasoned librarian.

ALCTS offers CE opportunities to its members and the library community in general in a variety of formats: Annual Conference preconferences, Annual Conference programs, web-based courses, webinars, Midwinter symposium, virtual symposia and preconferences, and e-Forums.

Programs offered at the ALA Annual Conference bring to one place topics of particular importance in the areas in which ALCTS has an interest. These programs represent topics that are of immediate concern; offer updates to new developments, issues, and trends; and in general educate the library community as a whole.

Preconferences and symposia bring ALCTS expertise to a setting at the ALA Annual Conference and Midwinter Meeting in which the entire library community can benefit from timely topics and knowledgeable speakers. These preconferences and symposia address a specific topic over one or two days at both the practical and theoretical level.

The development of web-based CE continues as a high priority for ALCTS. Through web-based learning, library staff from across the country and internationally can participate in a meaningful educational experience. ALCTS web-based courses are intended to address the continuing educational need of those who cannot attend workshops in person. These courses address the need for basic, practical information.

The Continuing Education Committee is charged with providing leadership and coordinating the overall development of the continuing education initiatives. The Program Committee is charged with providing leadership and coordinating the overall development of programs and preconferences presented at the ALA Annual Conference and Midwinter Meeting.

AWARDS

The ALCTS Awards Program recognizes significant contributions by those working in libraries in ALCTS areas of interest. ALCTS presents 13 awards for lifetime achievement, excellence in publishing, excellence in acquisitions, cataloging, preservation, serials, innovation, collaboration, and leadership, for librarians new to the profession who show particular promise, and for support staff travel to the ALA Annual Conference. ALCTS also awards the Presidential Citation to members who have contributed significantly in recent years to the association but who do not qualify for any of the other ALCTS awards.

Ross Atkinson Lifetime Achievement Award

This award was established in 2007 to honor the legacy of Ross Atkinson, distinguished library leader, author, and scholar, whose extraordinary service to ALCTS and the

library community at large serves as a model for those who follow.

The award, sponsored by EBSCO, is given to recognize the contribution of a library leader through demonstrated exceptional service to ALCTS and its areas of interest (acquisitions, cataloging and classification, collection management and development, preservation and reformatting, and serials). The award consists of a citation and \$3000.

Edward Swanson Memorial Best of *LRTS* Award

The Best of *LRTS* Award is given to the author(s) of the best paper published each year in *LRTS*. Each of the papers published in the volume year is eligible for consideration with the exception of official reports and documents, obituaries, letters to the editor, and biographies of award winners. The award is given to the paper whose content is a significant contribution about one or more issues addressed by ALCTS and its sections. In 2011, it was named in memory of Edward Swanson in recognition of his numerous contributions to making *LRTS* an outstanding professional journal.

ALCTS Outstanding Publications Award

This award honors the author or authors of the year's outstanding monograph, article, or original paper in the field of technical services, including acquisitions, cataloging, collection management, preservation, continuing resources, and related areas in the library field. Papers published in *Library Resources & Technical Services*, the ALCTS journal, are ineligible.

Ulrich's Serials Librarianship Award

The Ulrich's Serials Librarianship Award is presented for distinguished contributions to serials librarianship demonstrated by such activities as leadership in serials-related activities through participation in professional associations and/or library education programs, contributions to the body of serials literature, conduct of research in the area of serials, development of tools or methods to enhance access to or management of serials, and other advances leading to a better understanding of the field of serials. ProQuest sponsors the Ulrich's Award.

First Step Award, a Wiley Professional Development Grant

The First Step Award, offered by John Wiley & Sons, provides a librarian new to the serials field with the opportunity to broaden perspectives and supports professional development by funding travel to the ALA Conference and by participating in Serials Section activities. All ALA members with five or fewer years of professional experience in the serials field, who have not previously attended

an ALA Annual Conference, are eligible. This award is presented to the librarian who shows a commitment to professional development in the serials field as evidenced by participation in continuing education activities, workshops, previous participation in professional activities, and a commitment to or interest in serials-related work.

HARRASSOWITZ Leadership in Library Acquisitions Award

The Leadership in Library Acquisitions Award, sponsored by HARRASSOWITZ in honor of Dr. Knut Dorn, is given to recognize the contributions by and outstanding leadership of an individual to the field of acquisitions librarianship. This recognition is made for individual achievement of the highest order.

Margaret Mann Citation

The Margaret Mann Citation is awarded by CaMMS for outstanding professional achievement in cataloging or classification through either publication of significant professional literature, participation in professional cataloging associations, or valuable contributions to practice in individual libraries. A \$2000 scholarship is donated by OCLC to the U.S. or Canadian library school of the winner's choice. The Mann Citation represents the highest recognition of a professional in the cataloging or classification area.

Esther J. Piercy Award

The Esther J. Piercy Award was established by the RTSD of ALA in 1968 in memory of Esther J. Piercy, editor of the *Journal of Cataloging and Classification* from 1950 to 1956 and of *LRTS* from 1957 to 1967. This award, sponsored by YBP, Inc., recognizes the contribution of a librarian with not more than 10 yr of professional experience who has shown outstanding promise for continuing contribution and leadership to those areas of librarianship included in library collections and technical services.

Paul Banks and Carolyn Harris Preservation Award

The Paul Banks and Carolyn Harris Preservation Award, sponsored by Preservation Technologies, L.P., recognizes the contribution of a professional preservation specialist who has been active in the field of preservation and/or conservation for library and/or archival materials and who has shown superb leadership in professional associations at local, state, regional, or national level; has made significant contributions to the development, application or utilization of new or improved methods, techniques, and routines and to the professional literature; and has been a leader in training and mentoring in the field of preservation.

George Cunha and Susan Swartzburg Award

Established in 2007 by the PARS, the award honors the memory of George Cunha and Susan Swartzburg, early leaders in cooperative preservation programming and strong advocates for collaboration in the field of preservation.

The award, sponsored by the Library Binding Institute (\$1250), acknowledges and supports cooperative preservation projects and/or rewards individuals or groups that foster collaboration for preservation goals. Recipients of the award demonstrate vision, endorse cooperation, and advocate for the preservation of published and primary source resources that capture the richness of our cultural patrimony. The award recognizes the leadership and initiative required to build collaborative networks designed to achieve specific preservation goals. Since collaboration, cooperation, advocacy, and outreach are key strategies that epitomize preservation, the award promotes cooperative efforts and supports equitable preservation among all libraries, archives, and historical institutions.

ProQuest Coutts Award for Innovation

The ProQuest Coutts Award for Innovation is given to recognize the contribution of an individual who has demonstrated innovation and excellence in the practice of electronic collection management and development. This new award has been established by the CMDS to recognize significant and innovative contributions to electronic collections management and development practice. The award consists of a citation, a listing on the ALCTS Awards website, and \$2000.

Outstanding Collaboration Citation

This Outstanding Collaboration Citation recognizes and encourages collaborative problem-solving efforts in the areas of acquisition, access, management, preservation, or archiving of library materials. It recognizes a demonstrated benefit from actions, services, or products that improve and benefit in providing and managing library collections.

Jan Merrill-Oldham Professional Development Grant

The Jan Merrill-Oldham Professional Development Grant is awarded by the ALCTS PARS to provide librarians and

paraprofessionals new to the preservation field with the opportunity to attend a professional conference and encourages professional development through active participation at the national level. The grant is to be used for airfare, lodging, and registration fees to attend the ALA Annual Conference.

Presidential Citations

These very special awards honor ALCTS members who make significant contributions to the association and to the profession but whose accomplishments do not fall within the criteria for ALCTS' other awards. They are awarded by the current ALCTS President. The Presidential Citation is intended to recognize distinguished achievement by a member or members.

ALCTS Honors

ALCTS Honors is intended to recognize ALCTS members who have dedicated themselves to ALCTS through their service. That service can be holding an office, being a committee member, a committee chair, task force member, or other service as deemed applicable. It is the totality of service that this award seeks to acknowledge.

CONCLUSION

ALCTS, as one of the "functional" divisions of ALA, represents the voice of the library community in matters that reflect its interests, issues, and concerns: acquisitions, cataloging and metadata, collection management, preservation and reformatting, and continuing resources. In this role, ALCTS is seen as the "expert" by a vast array of constituent organizations and individuals, nationally and internationally. ALCTS advocates for creating, collecting, organizing, delivering, and preserving information resources in all forms to the library and information communities through the development and promulgation of principles, standards, and best practices. ALCTS leads through its members by fostering educational, research, and professional service opportunities. ALCTS is committed to quality information, universal access, collaboration, and lifelong learning.

Association for Library Service to Children (ALSC)

Virginia A. Walter

Department of Information Studies, University of California, Los Angeles, Los Angeles, California, U.S.A.

Abstract

The Association for Library Service to Children (ALSC) is one of 11 divisions of the American Library Association (ALA). Its members are drawn from the ranks of children's and school librarians, library educators, commercial vendors, and representatives of the children's book publishing community. Starting as the Club of Children's Librarians in 1900, it now boasts more than 4000 members and a broad-based program of activities focusing on advocacy, education, and partnerships. While best known outside of the library community for its implementation of the Newbery and Caldecott awards for distinguished contributions to American children's literature, the Association today engages in many activities and initiatives aimed at improving library services for children through the identification and promotion of best practices, the professional development of its members, and a strong program of advocacy.

INTRODUCTION

The Association for Library Service to Children (ALSC), one of 11 divisions of the American Library Association (ALA), is the primary American professional association for those who are concerned with the advancement of library service to children. Its members include children's librarians, school librarians, library educators, commercial vendors, and members of the children's book publishing community.

This entry looks briefly at the historical development of ALSC and discusses its current mission and activities. Among its more significant contributions to library service to children are the implementation of prestigious book awards, initiatives aimed at improving practice, continuing education and professional development, and advocacy.

HISTORY

Several of the pioneers of library service to children saw the need for both networking among their ranks and for acceptance within the larger library community. To this end, Caroline Hewins, Alice Jordan, and Anne Carroll Moore brought together a group of like-minded colleagues at the ALA Conference in Montreal in 1900; they called themselves the Club of Children's Librarians.^[1] A year later, in 1901, the Section for Library Work for Children was recognized by the parent organization, the ALA. Jacalyn Eddy notes that this was an important event in the recognition of library work for children as a bona fide specialization within the library profession.^[2] That section evolved into the American Association of School Librarians in 1915 and the Children's Library Association and

the Young People's Reading Roundtable in 1930. In 1941, those two associations and the roundtable merged to become the Division for Children and Young People. When ALA went through a restructuring in the mid-1950s, that division split into the Children's Library Association and the Association of Young People's Librarians, the latter being concerned with the relatively new specialization of teen services. In 1958, the Children's Library Association was renamed the Children's Services Division of the ALA and announced that it had "responsibility to speak for the ALA on those matters which concern children's books and other library materials and their use in libraries in any type which serve children."^[3] In 1976, the association changed its name to the Association for Library Service to Children, and it has retained this name since then.

ALSC TODAY

There are currently more than 4000 members of ALSC, making it the largest organization in the world dedicated to library services for children. Its 2006–2011 Strategic Plan claims as its core purpose: Creating a better future for children through libraries. It aims to accomplish that purpose through three primary goals involving advocacy, education, and collaboration.^[4]

Governance

ALSC accomplishes its goals and objectives through a complex governance structure. An elected Board of Directors provides leadership to the Association as a whole. Members participate directly in the work of the Association through committees. Membership on most committees

is by appointment of the vice president or president; but a few, specifically the more prestigious awards committees, are comprised of a mixture of elected and appointed representatives. Traditionally, ALSC committee members were required to attend both the midwinter and annual conferences. However, the development of new forms of electronic communication has made it possible recently for some committees to accomplish their work virtually without actually being present at the conferences.

ALSC committees are divided into eight priority groups: Child Advocacy, Evaluation of Media, Professional Awards and Scholarships, Organizational Support, Projects and Research, Awards, Partnerships, and Professional Development. A Priority Group Consultant, ordinarily an ALSC veteran with much experience serving on committees, is assigned to each of these committee clusters and is available to troubleshoot, answer questions, and provide leadership and guidance where needed.^[5]

ALSC maintains collegial relationships with the other two ALA divisions that promote library services to young people: The Young Adult Services Association (YALSA) and the Association of School Librarians (AASL). Their Boards meet together regularly to discuss matters of mutual concern, and their representatives on the ALA Council, along with other youth services librarians serving on that body, meet informally as a Youth Caucus.

The work of the association is funded through membership dues, grants, merchandise sales, and endowments. An Executive Director and office staff located at the ALA Headquarters in Chicago support the volunteer efforts of the membership.

Activities

Awards

Probably the activity for which ALSC is best known to the general public is its implementation of the Newbery and Caldecott Medals, the oldest and most prestigious awards given to children's literature in the United States. The idea for the Newbery Medal, an award given to the most distinguished contribution to American children's literature in a given year, came not from a librarian, but from the secretary of the American Bookseller's Association, Fredric G. Melcher. In 1919, he had launched Children's Book Week, a national initiative designed to promote the output of the emerging children's book publishing industry. Invited to speak about Children's Book Week at the 1921 ALA conference, he saw the possibilities within the library community for wider organized support for children's books. Writing in 1965 as he looked back on the evolution of the award, he noted many benefits that had occurred. Children's librarians had become more interested in the new books being published each year. Their status as a profession had increased. Creative people were more likely to write for children because award-

winning books had a longer life. He also paid tribute to the children's librarians in ALA who had cultivated the strict standards that gave the medal its luster.^[6]

Seventeen years later, children's book publishing had proliferated sufficiently to warrant a separate award for distinguished illustration. Again, Melcher was responsible for proposing the Caldecott Medal, which has been awarded every year since 1938. Originally, the Caldecott Medal book and runners-up were chosen by the same committee that named the Newbery Medal. In 1980, a separate Caldecott Committee was established.^[7] The prestige of these two awards has grown immensely. They are now announced, along with other ALA awards given to significant contribution to children's literature and film, at a press conference at the annual Midwinter Conference in the largest auditorium at the conference site. The award-winning author and illustrator and the ALA President are traditionally invited to appear the next morning on the *Today* show, and the awards are announced in the national news media. The gold seals on the books have become symbols of quality in literature for children.

Over the years, the ALSC leadership, with ALA's approval, has added many additional awards to highlight and promote contributions to different aspects of children's literature and related media. The Laura Ingalls Wilder Award was first given to its namesake in 1957; it honors an author or illustrator whose books published in the United States have made a lasting contribution to literature for children. Between 1960 and 1980, the Wilder Award was given every 5 years. From 1980 to 2001, it was awarded every 3 years. Beginning in 2001, it has been awarded every 2 years.^[8] The Mildred L. Batchelder Award honors a former executive director of the Association for Library Service to Children. Established in 1966, it is a citation awarded to an American publisher for a children's book for the most outstanding book originally published in a foreign language in a foreign country and subsequently translated into English and published in the United States.^[9] The Andrew Carnegie Medal for Excellence in Children's Video was awarded for the first time in 1991.^[10] In 1996, ALSC and Reforma, the National Association to Promote Library and Information Services to Latinos and the Spanish-Speaking, established the Pura Belpré Award, presented to a Latino/Latina writer and illustrator whose work best portrays, affirms, and celebrates the Latino cultural experience in an outstanding work of literature for children and youth. Originally given every other year, it becomes an annual award in 2009.^[11] Nonfiction, while eligible for both the Newbery and Caldecott awards, is singled out for special attention with the Robert F. Sibert Informational Book Medal, established in 2001.^[12] Awards that honor contributions by African-American authors and illustrators are not given by ALSC; they are an activity of the Coretta Scott King Task Force of the Ethnic and Multicultural Materials Information Exchange Roundtable (EMIERT) of ALA.^[13] More recently, the American Indian

Library Association, an ALA affiliate association, has launched its own awards honoring American Indian authors and illustrators of books for children.^[14] The Theodor Seuss Geisel Award, established by ALSC in 2004 and first presented in 2006, is given to the author and illustrator of the most distinguished American book for beginning readers.^[15] The newest award is the Odyssey Award for Excellence in Audiobook Production. It is jointly administered by ALSC and the Young Adult Library Services Division.^[16]

The awards administered by ALSC have done a great deal to publicize quality children's literature and have helped to legitimize the role of children's librarians in promoting the best in children's books. However, ALSC has also worked to improve the practice of children's librarianship in areas other than book evaluation and the related area of collection development.

Improving Practice

This entry will focus on just three activities undertaken by ALSC that have as their objectives the improvement of library service to children. The first of these is the development of a set of core competencies for children's librarians. Established in 1999, the competencies outline a broad range of skills, knowledge, and aptitudes required for those professionals who practice the specialization of children's librarianship. The competencies are divided into seven broad categories: knowledge of client group; administrative and management skills; materials and collection development; programming skills; advocacy; public relations, and networking skills; and professionalism and professional development. As the authors of a book that provides resources and examples of best practices related to the competencies point out, children's librarians are "the original multitaskers of the library world."^[17] The ALSC competencies are intended to guide children's librarians as they develop their professional skills and also to inform public library administrators about what they can and should expect from these specialists.

Every Child Ready to Read (ECRR) is a collaborative initiative sponsored by ALSC and the Public Library Association (PLA). ECRR began with a partnership between PLA and the National Institute of Child Health and Human Development (NICHD). In 2000, NICHD had released the National Reading Panel's Report outlining research-based findings on reading development in America's children. PLA partnered with NICHD to disseminate the report through public libraries. The next step in the collaboration was to develop model public library programs that incorporated the research. PLA contracted with two emergent literacy researchers, Dr. Grover C. Whitehurst and Dr. Christopher Lonigan, to develop a model program for parents and caregivers that would give them the skills for preparing young children to read.

ALSC joined PLA as a partner in this endeavor. They selected 20 demonstration sites representing a broad range of library size and population demographics. The sites tested and evaluated the materials. In 2002, a second round of evaluation testing was conducted at 14 sites. Finally, the materials that were developed by Whitehurst and Lonigan were packaged as scripted workshops and made available for purchase or through free downloads on the ALA Web site.^[18] In addition to the research-based curriculum that is aimed at encouraging early literacy skills in infants, toddlers, and preschoolers, there is an emphasis on modeling techniques such as dialogic reading during regular library storytimes.^[19] Anecdotal evidence suggests that the ECRR approach to library-sponsored parent and caregiver education has been widely adopted, but an evaluation study is currently being conducted to see just how broadly the materials are being used.

Finally, *El día de los niños/El día de los libros* (Children's Day/Book Day) is an activity that calls attention to the growing Latino and Spanish-speaking population of the United States. *Día*, as the initiative is known, is a celebration of children, families, and reading that emphasizes the importance of literacy for children of all linguistic and cultural backgrounds. Children's book author Pat Mora proposed linking the already existing observation of Children's Day with literacy. ALSC has joined with REFORMA to sponsor the annual event, now celebrated on April 30. Funding from the W.K. Kellogg Foundation and Target has helped to generate promotional materials and national interest. Public libraries have observed *Día* in a number of ways, from community festivals to author visits and booklists celebrating Latino culture and heritage.^[20]

Continuing Education and Professional Development

Programs such as ECRR and *Día* are initiatives designed to generate best practices in particular areas of library service to children. Through a wide program of continuing education, ALSC aims to provide multiple forums for children's librarians to develop professionally and presumably to then provide increasingly effective service to children.

There are three primary vehicles for providing continuing education opportunities to the ALSC membership. These are conference programs, regional institutes, and publications. The ALA holds two conferences each year. The Midwinter Conference is intended as a working meeting for the leadership of the Association and its divisions. Boards, divisions, roundtables, task forces, and committees meet, but association policy dictates that there be no programs for the general membership.

The Summer Conference, on the other hand, is a three-ring circus with program offerings from morning to night from Saturday through Monday. Many ALSC committees organize programs designed to educate and update members

on emerging trends and current thinking about best practices. The preliminary program for the 2008 summer conference in Anaheim indicates a wide array of continuing education offerings for ALSC members on topics ranging from readers' theater to programming for non-English-speaking preschoolers and their families to Library 2.0 for children's librarians and gaming for elementary school children. The summer conference is also a venue for showcasing authors, illustrators, and distinguished speakers from related fields. Distinguished pediatrician, Dr. Barry Brazelton, was the keynote speaker at the ALSC President's Program in 2008.

In addition to the programming offered through the annual summer conferences, ALSC has made a practice of holding a 2-day national institute every 2 years. These institutes, held in different parts of the country, have tended to focus on two or three current issues. In September, 2008, for example, the Institute features three tracks: technology and children's services, programming in the new millennium, and reading promotion with an emphasis on "twens."^[21]

Advocacy

ALSC organizes its working committees into priority groups, and Priority Group 1 is concerned with child advocacy. The function statement for this cluster of activities reads: "To identify, evaluate and make recommendations on issues, legislation and services concerning children on the local, state and national levels."^[22] The Committees charged with this general function include Intellectual Freedom, International Relations, Legislation, Library Service to Special Population Children and their Caregivers, Early Childhood Services and Programs, Public Awareness, and School-Age Programs and Services. The International Relations committee has been active recently, calling attention to books that foster global perspectives and international understanding. Both the Intellectual Freedom and Legislation committees also meet with their counterparts from other ALA divisions in larger assemblies of interest. Together, these committees help to ensure that ALSC meets its responsibilities to advocate for the well-being of children in the larger society as well as within the library profession.

CONCLUSION

As ALSC embarks on its second century of service, it faces new challenges and opportunities. Its existing leadership is drawn from the ranks of librarians who are facing retirement; in fact, both its 2008–2009 president and vice president/president-elect have already retired. There is some danger that the Association, with its many years of tradition, may be perceived as being a little stodgy. It must find a way to attract more young librarians to join, become

active, and be judged ready to assume responsible positions in the very near future. These younger professionals promise to bring fresh perspectives that may revitalize current activities of the association and suggest important new directions. One of the strategies being used to draw in younger professionals is an increased use of digital media to communicate with members—the ALSC wiki and blog as well as its discussion list—and the opportunity to participate in some committees virtually without the need to be physically present at conferences.

While the hundred-plus years of history may sometimes feel like an albatross around the neck of those members who would like the Association to be more innovative, this sense of tradition and stability also attracts many potential partners to work with its staff and leaders. Head Start, NASA, and producers of public television programs such as *Between the Lions* and *Dora the Explorer* have all initiated partnerships with ALSC.

ALSC has made a permanent imprint on children's book publishing and children's reading through the prestigious awards it bestows on works of distinction. It has yet to make the same impact on digital media for children, in spite of its efforts to promote "great Web sites for kids." Perhaps this will be a contribution of the second 100 years.

Association of College and Research Libraries (ACRL)

Mary Ellen Davis

Mary Jane Petrowski

American Library Association, Chicago, Illinois, U.S.A.

Abstract

The Association of College and Research Libraries (ACRL) is the higher education association for librarians. Representing more than 10,500 academic and research librarians and interested individuals, ACRL (the largest division of the American Library Association) is the only individual membership organization in North America that develops programs, products, and services to help academic and research librarians learn, innovate, and lead within the academic community. Founded in 1940, ACRL is committed to advancing learning and transforming scholarship. ACRL represents librarians working with all types of academic libraries—community and junior college, college, and university—as well as comprehensive and specialized research libraries and their professional staffs. ACRL activities are guided by the core values, vision, and goals in ACRL's strategic plan, the Plan for Excellence. The core purpose of ACRL is to lead academic and research librarians and libraries in advancing learning and transforming scholarship. ACRL advances its work by serving as a channel of communication among academic librarians, faculty, students, administrators, other information professionals, higher education organizations, federal, state, and local governments, and the larger society. It is the leading professional organization of choice for promoting, supporting, and advancing the values of academic libraries to the higher education community. ACRL and, indeed, the American Library Association itself, were founded to establish regular channels for communication among librarians. Today ACRL is a dynamic, inclusive organization that has grown into a large association encompassing all types of positions in all types of academic and research libraries.

INTRODUCTION

The Association of College and Research Libraries (ACRL) is the higher education association for librarians. Representing more than 10,500 academic and research librarians and interested individuals, ACRL (the largest division of the American Library Association) is the only individual membership organization in North America that develops programs, products, and services to help academic and research librarians learn, innovate, and lead within the academic community. Founded in 1940, ACRL is committed to advancing learning and transforming scholarship. ACRL represents librarians working with all types of academic libraries—community and junior college, college, and university—as well as comprehensive and specialized research libraries and their professional staffs. In July 2015, ACRL had a total of 10,598 members (accounting for 18.9% of ALA's membership): 9,941 personal members, 639 organizational members, and 18 corporate members. Approximately 43% of the personal members work in research/doctoral-granting institutions, 24% in comprehensive institutions, 15% in four-year colleges, 12% in two-year/technical institutions, 1% in independent research libraries, and 1% in information-related organizations. ACRL activities are guided by the core values, vision, and goals in ACRL's strategic plan, the Plan for Excellence. The core purpose of ACRL is to lead academic and research librarians and libraries in advancing learning and transforming scholarship.

ACRL advances its work by serving as a channel of communication among academic librarians, faculty, students, administrators, other information professionals, higher education organizations, federal, state, and local governments, and the larger society. It is the leading professional organization of choice for promoting, supporting, and advancing the values of academic libraries to the higher education community. ACRL and, indeed, the American Library Association itself, were founded to establish regular channels for communication among librarians. Today ACRL is a dynamic, inclusive organization that has grown from its early origins of college and reference librarians to a large association encompassing all types of positions in all types of academic and research libraries. ACRL members hold a variety of positions and responsibilities in the areas of management, public and information services, technical services, online services, assessment, information literacy, data curation and management, collection development, rare books and special collections, nonprint media, and distributed education.

ORIGINS OF ACRL

Since the late nineteenth century, conferences and meetings of professional groups have been an American institution. They reflect our penchant for association and our passion for professional self-improvement. In 1853 American librarians held their first convention in New York City.

About one-fifth of the 81 librarians who attended the meeting were college librarians.^[1] Not until a generation had passed, however, and the crisis surrounding the Civil War was over, did American librarians hold a second national meeting. In the spring of 1876, Melvil Dewey and Frederick Leypoldt sent out their famous call for a conference of librarians to promote “efficiency and economy in library work.”^[2] Of the 103 librarians present when the conference convened in Philadelphia on September, 10 were college librarians.^[3] The focal point of the 1876 meeting was the reading of papers on practical library subjects such as cooperative cataloging, indexing, and public relations. The response to the program was apparently positive because the conference participants voted on the final day of the meeting to establish the American Library Association and to hold Annual Conferences.^[4]

From the beginning, the American Library Association was a predominantly public library organization. But, the areas of common interest between public and academic libraries are extensive, and for the first dozen years of the association’s existence the college librarians attending ALA conferences did not hold separate meetings. Finally, in 1889, a group of 13 college librarians caucused at the Annual Conference in St. Louis and recommended that a college library section be formed. The following year at the 1890 Annual Conference in the White Mountains of New Hampshire, 15 librarians representing most of the major colleges of the Eastern seaboard, including Harvard, Yale, Columbia, the Massachusetts Institute of Technology, and Brown, held the first meeting of the College Library Section.^[5] The new section was a small, relatively informal discussion group attended for the most part by administrators who could afford long distance travel. The annual meetings of the section provided a forum for the presentation and discussion of papers on such topics as reference work, cataloging, departmental collections, union lists, and the like.^[6]

In 1897, the section acquired a new name, the College and Reference Library Section (to recognize the participation of reference librarians) and, after the turn of the century, began to select officers to plan annual meetings. Not until 1923, however, did the section adopt its own bylaws and thereby cross the line that separates a discussion group from a section within ACRL today. The 1923 bylaws regularized the existence of the section by establishing a Board of Management with three officers to conduct the business of the section between conferences and provided for the levying of annual membership dues of 50 cents.^[7] During the course of the 1920s, attendance at section meetings grew from 90 in 1923 to 240 in 1926 and peaked at 800 in 1928 before dropping off to 600 in 1929. The meeting program of the section during the twenties and thirties included general sessions for the whole section as well as separate roundtables for college and reference librarians. The topics discussed at the early section meetings are issues that still confront academic librarians today: faculty status and personnel classification, teaching students, interlibrary loan, library standards, etc.^[8]

From 1890 to 1938, the College and Reference Library Section served primarily as a forum for discussion. But, beginning in the 1920s, pressure began to build in the academic library profession for the creation of a stronger professional organization capable of undertaking a broad range of activities, programs, research, and publications. The occasion for a radical restructuring of the section came in the mid-1930s when ALA roundtables representing teachers, college librarians, and junior college librarians expressed the desire to affiliate with the College and Reference Library Section. In 1936, the chair of the section appointed a Committee on Reorganization to develop plans for restructuring the section. The final report of the committee in 1938 recommended the adoption of new bylaws that would transform the section into an Association of College and Reference Libraries with full autonomy over its own affairs. The new bylaws provided for the creation of subsections within the association for college libraries, junior college libraries, teachers college libraries, university libraries, and other groups that might wish to affiliate.

ACRL BECOMES A DIVISION

The section approved the proposed bylaws in June 1938 and officially became the Association of College and Reference Libraries (ACRL) by the end of the year. The ALA Council responded by ratifying a new ALA constitution that made provision for the creation of self-governing divisions within ALA, entitled to receive a share of ALA dues.

ACRL swiftly prepared a new constitution to meet the conditions for division status, and the ALA Council recognized ACRL as ALA’s first division on May 31, 1940.^[9] The Association of College and Reference Libraries started its new life with six nearly formed subsections of its own: Agricultural Libraries Section, College Libraries Section, Junior College Libraries Section, Librarians of Teacher Training Institutions Section, Reference Libraries Section, and University Libraries Section. When the Reference Libraries Section departed to join the newly formed Library Reference Services Division in 1956, ACRL substituted “Research” for “Reference” in its name and became the Association of College and Research Libraries.^[10] With its sections, chapters, and discussion groups, ACRL grew rapidly after its beginnings in 1938: membership jumped from 737 in 1939 to 2,215 in 1941, rose to 4,623 in 1950, increased to 9,324 in 1975, reached 11,524 in 2000, and dropped back to 10,598 in July 2017.^[11]

ACRL Office

First executive secretary

ACRL and its network of sections and committees grew so rapidly after 1938 that by the end of World War II the association could no longer, as A. H. Kuhlman put it, “be expected to run of its own accord.”^[12] The elected leaders

of ACRL were convinced that it was now essential to have a professional executive secretary, working under the direction of the president and Board of Directors, to integrate the activities and services of the association. As early as 1931, the ALA Council, recognizing that the interests of academic libraries had not always received adequate attention at ALA headquarters, authorized the appointment of a College Library Advisory Board (CLAB) to advise the ALA Board of Directors on academic library questions. One of the first recommendations of CLAB was that a full-time academic library specialist be employed at ALA headquarters to provide information and advisory services for college librarians. The ALA Council approved this recommendation for a college library specialist in principle, but throughout the rest of the 1930s and the war period, ALA never found the money to fill the position.^[13] The issue came to a head in 1946 when ACRL, with its growing membership and pressing need for professional staff, made clear that it would seriously consider withdrawal from ALA if the question of funds for a paid executive was not resolved satisfactorily. ALA responded within the year by appropriating funds to finance an ACRL headquarters staff.^[14]

Orwin Rush, the librarian of Clark University, came to ALA headquarters in the spring of 1947 as ACRL's first executive secretary. After launching the new ACRL office and clearing the way for its future, Rush departed for the University of Wyoming in 1949. In his place came "young Arthur Hamlin, fresh from the University of Pennsylvania." Hamlin described the ACRL office in the early fifties this way: "Physically, the ACRL headquarters office is a second floor front room, complete with fireplace, in the large, old-fashioned, reconverted mansion which is ALA headquarters at 50 East Huron Street in Chicago. Here an active staff of four, the executive secretary, the publications officer, a secretary and a clerk-typist, with their typewriters, telephones, file cabinets, and visitors hold forth. Like many a library staff area, ACRL headquarters is a noisy, crowded, active place."^[15] In 1961, a modern headquarters building replaced the old mansion.

Communities of Practice

One of ACRL's primary strengths is the effectiveness of its communities of practice, including committees, discussion groups, editorial boards, interest groups, sections, and chapter affiliates in meeting the interests of ACRL's diverse membership. Membership in ACRL provides opportunities to become involved with communities of practice that focus on specializations within the profession. The 44 chapter affiliates provide members with networking opportunities at the local level throughout the North America.

Chapters

In 1952, ACRL took the first step toward encouraging participation at the local level by recognizing its first local

chapter—the Philadelphia Area Chapter. ACRL currently has 44 chapters, two of which include Canadian provinces. In 2017, two new chapters formed: a second Michigan chapter affiliated with the Michigan Academic Library Association, and the ACRL Idaho chapter. The purpose of the chapters is to bring the national organization closer to individual members and to provide programs beneficial to members at the local level.

Discussion Groups

In the 1970s, ACRL added a new community of practice to its national organization—the discussion group. As of September 2017, ACRL had 22 discussion groups. In a sense, the discussion groups are a reincarnation of the original College Library Section. They provide a relatively informal framework for librarians with similar interests to gather to exchange ideas and information.

Interest Groups

In 2008, ACRL members approved a bylaws change allowing for the creation of Interest Groups. As of September 2014, ACRL members can affiliate with an unlimited number of sections and interest groups with no additional charge. By October 2009, seven new interest groups were established including Academic Library Services to International Students, Health Sciences, Image Resources, Numeric and Geospatial Data Services in Academic Libraries, Residency Programs, Universal Accessibility, and Virtual Worlds. In May 2011, the Digital Curation Interest Group was approved by the Board. In June 2012, the Librarianship in For-Profit Educational Institutions Interest Group and the Library and Information Science (LIS) Education Interest Group were approved by the Board. In June 2013, the Technical Services Interest Group was approved by the Board. In 2017 the Board approved the 5 new interest groups including the Academic Library Services for Graduate Students Interest Group, the Asian, African, and Middle Eastern Studies Interest Group, History Librarians Interest Group, Institutional Research Interest Group, and Library Services for Graduate Students Interest Group. As of 2017, ACRL had 21 interest groups.

Sections

By 1979, the association had 13 sections: the three "types-of-libraries" sections (College, Community College, and University) plus the Arts Section, Asian, African, and Middle Eastern Section (which became an interest group in 2017), Anthropology Section, Instruction Section (name changed from the Bibliographic Instruction Section in 1995), Education and Behavioral Sciences Section (into which the old Teachers Training Section was incorporated), Public Policy and International Relations Section

(name changed from Law and Political Science Section in 2016), Rare Books and Manuscripts Section, Science and Technology Section (with which the Agricultural Section was merged), European Studies Section (created by a merger of the Slavic and East European Section and the Western European Studies Section in 2017). Between 1987 and 1990, three more sections were formed: Women's Studies Section in 1987 (name changed to Women and Gender Studies in 2011); African-American Studies Librarians Section in 1989 (which became an interest group in 2016); and the Distance Learning Section in 1990 (name changed from Extended Campus Libraries Services Section in 1998). In 1994, the Literatures in English Section (name changed from English and American Literature Section in 2000) was formed. By 1997, ACRL had 17 sections, and this number remained static until 2017 when the number dropped to 15 sections following the merger of SEES and WESS as well as the transition of AAMES and AFAS to interest groups. The Digital Scholarship Section was created in 2017.

Coordination and Oversight

It is the responsibility of the ACRL executive director and staff to coordinate the work of ACRL's 55 committees, 16 sections, 22 division-level discussion groups, 9 editorial boards, 21 interest groups, 22 discussion groups, and 44 chapters. To ensure the smooth operation of this complex structure, the headquarters staff monitors the many procedural details associated with appointments, archiving, awards, budgets, elections, meetings, programs, reports, and so on. ACRL currently has 15.75 FTE approved positions for its Chicago office (housed in the ALA headquarters) and 22.4 positions for its *CHOICE* office in Middletown, Connecticut. The ACRL office works closely with committees and sections to plan stimulating meetings at ALA conferences, and also manages the arrangements for ACRL preconferences and conferences. Planning for these conferences begins years in advance as detailed arrangements are worked out for hotel space, meeting times, exhibits, programs, publicity, and finances.

The ACRL office supports ACRL's publication program by providing assistance to the editors of *C&RL*, *RBM*, and *Publications in Librarianship*, by working closely with the editor of *CHOICE* who reports to the executive director, by publishing and distributing the many publications of ACRL committees and sections, and by writing, editing, and publishing *C&RL News*, the association's monthly news publication. With the exception of *CHOICE*, the ACRL staff based in Chicago manages the production of all ACRL books and journals.

Clearinghouse

Together with the ALA Headquarters Information Center, the ACRL office serves as a clearinghouse for information on academic library concerns and issues. The office

handles inquiries regarding policies and practice. It also offers information about ALA activities and services and is in daily contact with the staff of other ALA divisions and offices, including the Washington Office.

Ambassador

ACRL serves as the ambassador for academic libraries and librarians at ALA headquarters. The ACRL Executive Director plays a key role in representing the association to other library and information associations as well as to higher education and government communities. In this role, the executive director attends meetings and gives presentations in many parts of the country each year. In doing so, the director strives to maintain and establish lines of communication between the academic library profession and other communities. In 1984, a new standing committee, the Professional Liaison Committee, was established to further cooperative efforts and to put stronger emphasis on ACRL's liaison efforts with other associations. To build upon this work, in 1995, the ACRL Board developed the Professional Liaison Committee as the Council of Liaisons, identifying an initial nine important higher education associations to which it will send a liaison. The Council and the Board annually review the list of liaison organizations. In 2009, the Board expanded its liaison work and reconstituted the Council of Liaisons as the Liaison Coordinating Committee.

Strategic Planning

Guiding all association activity is the strategic planning process adopted by ACRL. This process relies on member input to articulate the direction of the professional organization, and to identify areas of highest priority for association activity. Since 1981, ACRL has updated its strategic plan, mission, and vision on a regular basis. Each year the ACRL Board of Directors sets the priorities and performance indicators for the association. At the 2003 Midwinter Meeting, the Board authorized contracting with Tecker Consultants to lead a strategic planning process. Extensive data gathering took place including telephone interviews, focus groups, leadership sessions, and an all-member web-based survey. The Board reviewed the data, drafted a plan, tested its thinking with the members, and made revisions. The new strategic plan, "Charting Our Future: ACRL Strategic Plan 2020," was approved by the Board at the 2004 Annual Conference and is reviewed annually with minor changes being made each fall at the Fall Executive Committee Meeting. The Board is now working to encourage ACRL's units to align their work with the strategic plan. The Board began a new strategic planning cycle at the 2010 Midwinter Meeting which culminated in a new "Plan for Excellence" which was approved in June 2011. The Board reviews progress on the plan at its annual Strategic Planning Session and makes

adjustments as needed. In September 2015, the Board began discussion on the revision of the Plan for Excellence and in March 2016 approved updates to the goals and objectives.

IMPACT ON HIGHER EDUCATION, SCHOLARLY COMMUNICATION, AND CIVIC DEVELOPMENT

ACRL is ALA's key link to the higher education community, and one of ACRL's strategic directions is to ensure that the contributions of academic and research libraries and librarians to higher education, scholarly communication, and civic development are recognized by society. To this end, ACRL has undertaken several initiatives.

Working with Higher Education Associations

In 1995, ACRL identified a number of higher education organizations with which to share ideas and implement programs in areas of mutual interest. ACRL assigned member liaisons to these organizations and these individuals comprised the ACRL Council of Liaisons. The ACRL Board expanded the work of its liaison program in 2010 under the umbrella of a Liaison Coordinating Committee that encouraged ACRL units to explore liaisons and work with other associations. These organizations currently include: the Academy of Criminal Justice Sciences (ACJS), American Anthropological Association (AAA), American Association for the Advancement of Science (AAAS), American Association of Community Colleges (AACC), American Chemical Society (ACS), American Institute of Biological Sciences (AIBS), American Physical Society (APS), American Political Science Association (APSA), American Society for Engineering Education (ASEE), American Sociological Association (ASA), Association for Information Science and Technology (AIST), Association for Library and Information Science Education (ALISE), Association for the Study of African American Life and History (ASAALF), Council of Botanical and Horticultural Libraries, Council of Independent Colleges (CIC), EDUCAUSE Learning Initiative (ELI), International Association of Aquatic and Marine Science Libraries and Information Centers, Medical Library Association (MLA), Modern Language Association (MLA), National Resource Center for the First-Year Experience, National Women's Studies Association (NWSA), Society for College and University Planning (SCUP), Society for Information Technology and Teacher Education (SITE), Special Libraries Association (SLA), and the United States Agricultural Information Network. One of ACRL's early successful liaisons was with the American Association for Higher Education (AAHE), which ceased operations in mid-2005. Sample collaborative activities included joint sponsorship of a provosts' luncheon at the AAHE annual conference and AAHE participation in developing the Information Literacy

Competency Standards for Higher Education. ACRL has also developed subject-specific information literacy standards in collaboration with subject discipline organizations. ACRL also belongs to the Council for Higher Education Management Association (CHEMA), and the Coalition for Networked Information (CNI), which has led to increased collaboration. In 2011, ACRL partnered with the Association for Institutional Research (AIR), the Association of Public and Land-grant Universities (APLU), and the Council of Independent Colleges to convene two national summits as part of the IMLS-funded project "Building Capacity for Demonstrating the Value of Academic Libraries." In September 2012, ACRL continued its partnership with AIR and APLU on the three-year "Assessment in Action: Academic Libraries and Student Success" program, made possible by IMLS. ACRL has also collaborated with CIC through participating and supporting CIC's Information Literacy and Fluency workshops for campus teams of librarians, subject-discipline faculty, and administrators. Beginning in 2010, ACRL increased its presence with the American Council of Learned Societies, and the executive director has been invited to make several presentations on scholarly communication and open access.

Standards and Guidelines

Developing standards is an area where ACRL committees have made some of their most important contributions to academic librarianship. In 1957, the ACRL Committee on Standards, after two years of work, produced the "first real set of 'Standards for College Libraries' to enjoy the consensual support of the profession."^[16] Since then, ACRL committees have developed standards for university libraries and two-year learning resources programs. In 2004, the ACRL Board approved the outcomes-based "Standards for Libraries in Higher Education," inclusive of all academic libraries, and this standard was revised in 2011. ACRL recruited and hired a team of trainers and have a licensed one-day workshop, "Planning, Assessing, and Communicating Library Impact: Putting the Standards for Libraries in Higher Education into Action," to a variety of campuses and chapters. Guidelines have also been developed in many specific areas including cultural competencies, personnel, instruction, branch libraries, library services for distance education, rare books and special collections, and undergraduate libraries. "Standards for Libraries in Higher Education" (2011) took the 2004 outcomes model a step further and are designed to guide academic libraries in advancing and sustaining their role as partners in educating students, achieving their institutions' missions, and positioning libraries as leaders in assessment and continuous improvement on their campuses.

In January 2000, the ACRL Board approved the "Information Literacy Competency Standards for Higher Education." The American Association of Higher Education and the Council of Independent Colleges have endorsed these

standards and they are widely used on campuses across the country. There is global interest in the information literacy competency standards and they have been translated into 8 languages. Discipline-based information literacy guidelines have been developed for anthropology and sociology, journalism, literatures in English, political science, psychology, science and technology, as well as teacher education.

In June 2012, the Board approved recommendations of a review task force that ACRL's "Information Literacy Competency Standards for Higher Education" be extensively revised. In spring 2013, a second task force began the revision process, leading to the development of a draft "Framework for Information Literacy for Higher Education." Following a process that included several drafts and public comment periods, the Board took the official action of approving the Framework at the 2017 ALA Annual Conference in Orlando.

Among its guidelines in the personnel arena, the ACRL Committee on Academic Status in 1971 drew up "Standards for Faculty Status for College and University Libraries." The ACRL Board approved the Standards in June 1971, and as a corollary, ACRL drafted a "Joint Statement on Faculty Status of College and University Librarians" with the American Association of Colleges (AAC) and the American Association of University Professors (AAUP). ACRL, AAC, AAUP, and a host of other associations endorsed the statement, which laid down a clear definition of the obligations and benefits of academic status. This Joint Statement was reaffirmed by the ACRL Board of Directors at the 2007 Annual Conference. In 1992, "Standards for Faculty Status for College and University Librarians" was revised—"the first revision of this seminal document in the 21 years that had elapsed since its approval by a voice vote of the membership at Dallas in 1971."^[17] At the 1993 Midwinter Meeting, the ALA Council, by consent, approved the incorporation of the revised Standards into the ALA Handbook of Organization. Council's exceptional action reaffirms "faculty status as the desired and appropriate condition of academic librarians nationally and lends the document the support of the prestigious parent body."^[18] A new revision of the Standards was approved by the ACRL Board of Directors at the 2011 Annual Conference.

In 1997, the Board approved changing the name of the Academic Status Committee to the Academic Librarians Status Committee, and by 2013, the Board decided it was best to take up the revision of these guidelines with task forces as needed and dissolved the standing committee. At the 2005 Annual Conference, the ACRL Board of Directors approved an updated version of the "Guidelines for the Appointment, Promotion, and Tenure of Academic Librarians." At the 2006 Midwinter Meeting, the ACRL Board of Directors approved the "Guidelines for Media Resources in Academic Libraries" and a revision of the "Guidelines for Academic Status for College and University Librarians." The 2007 Annual Conference saw the ACRL Board of Directors reaffirm the 1989 "Statement on the Certification & Licensing of Academic Librarians"

and the "Statement on the Terminal Professional Degree for Academic Librarians," and approve the "Standards for Proficiencies for Instruction Librarians and Coordinators." 2009 through mid-2011 saw a number of standards revised and developed, including "ALA-SAA Joint Statement on Access to Research Materials in Archives and Special Collections Libraries," "Guidelines for Curriculum Materials Centers," "A Guideline for Appointment, Promotion and Tenure of Academic Librarians," "A Guideline for the Screening and Appointment of Academic Librarians," "Information Literacy Standards for Teacher Education," "Psychology Information Literacy Standards," "Standards for Proficiencies for Instruction Librarians and Coordinators: A Practical Guide," "Statement on the Certification & Licensing of Academic Librarians," and "Statement on the Terminal Professional Degree for Academic Librarians."

New and revised standards approved from 2012 through 2017 include "ACRL Statement on Academic Freedom," "ACRL/RBMS Guidelines For Interlibrary And Exhibition Loan of Special Collections Materials," "Characteristics of Programs of Information Literacy that Illustrate Best Practice: a Guideline," "Competencies for Special Collections Professionals," "Guidelines for Recruiting Academic Librarians," "Diversity Standards: Cultural Competency for Academic Libraries," "Framework for Information Literacy for Higher Education," "Guidelines for University Library Services to Undergraduate Students," "Joint Statement on Faculty Status of College and University Librarians," "Proficiencies for Assessment Librarians and Coordinators," "Roles and Strengths of Teaching Librarians," and "Standards for Distance Learning Library Services."

Awards

The ACRL awards program honors the best and brightest stars of academic librarianship. Sixteen awards recognize and honor the professional contributions and achievements of ACRL members. This special recognition by ACRL enhances the sense of personal growth and accomplishment of its members, provides its membership with role models, and strengthens the image of its membership in the eyes of employers, leadership, and the academic community as a whole. Among its most prestigious achievement awards are the Academic/Research Librarian of the Year Award and the Excellence in Academic Libraries Awards, both sponsored by GOBI Library Solutions from EBSCO.

There are three basic types of ACRL awards: achievement and distinguished service, research/travel grants, and publications. Achievement and distinguished service awards are intended to honor academic and research librarians for significant past achievements, such as publications, program development, or general leadership in the profession. Such awards include a plaque and may also involve a cash award. Research and travel awards, normally in the form of grants, can also recognize past

achievements, but their main purpose is to assist academic and research librarians in completing a research project, usually relating to some aspect of academic or research librarianship. Publication awards are given for outstanding articles, bibliographies, catalogs, etc. ACRL awards are given to either individuals or groups. Depending upon the terms of the award, recipients do not necessarily need to be members of ACRL.

Value of Academic Libraries

As librarians are increasingly called upon to demonstrate the value of academic libraries and their contribution to institutional goals, ACRL is responding with research and resources to support the profession in meeting this challenge. ACRL's Value of Academic Libraries Initiative, part of the 2011 Plan for Excellence, is a multiyear project designed to provide academic librarians with competencies and methods for demonstrating library value relative to the mission and goals of postsecondary institutions.

ACRL has long been concerned with accountability, assessment, and student learning. In the early 1980s, ACRL was on the cutting edge of these issues with a publication on assessment to "stimulate librarians' interest in performance measures and to provide practical assistance so that librarians could conduct meaningful measurements of effectiveness with minimum expense and difficulty." The association is a national authority that the higher education community looks to for standards and guidelines to enhance library effectiveness.

Building on this work and given the emphasis on assessment issues, ACRL leadership and staff held an invitational meeting in 2009 with members of the library research community to discuss actions related to assessing and documenting library value. ACRL then commissioned a report on existing research and literature on the topic: *The Value of Academic Libraries: A Comprehensive Research Review and Report*. This report recommends that ACRL create a professional development program to build the profession's capacity to document, demonstrate, and communicate library value in alignment with institutional goals.

In response, ACRL, together with three partners – the Association for Institutional Research, Association of Public and Land-grant Universities, and the Council of Independent Colleges – was awarded an IMLS grant in 2011 from the Federal Institute of Museum and Library Services for a National Leadership Collaborative Planning Grant Level II. The grant proposal, "Building Capacity for Demonstrating the Value of Academic Libraries," submitted in February 2011, covered costs to convene two national summits in late fall 2011 to determine the professional competencies that librarians need. College and university chief academic officers, senior institutional researchers, representatives from accreditation commissions and higher education organizations, and academic librarians attended the summits to share their best thinking. A white paper, "Connect, Collaborate, and

Communicate: A Report from the Value of Academic Libraries Summits" summarizing the findings and setting a framework for future action was published in June 2012.

As a direct result of the IMLS collaborative planning grant, ACRL submitted a follow-up proposal in early 2012 and was awarded a National Leadership Demonstration Grant of \$249,330 by the IMLS for the program "Assessment in Action: Academic Libraries and Student Success" (AiA) in September 2012. A professional development program to strengthen the competencies of librarians in campus leadership and data-informed advocacy has been designed, implemented, and evaluated. The project goals and anticipated outcomes consider the experiences of students in academic libraries and the impact of the library on student learning and success. Over 200 institutions have participated in the three-year project. Each participating institution identified a team, consisting of a librarian and at least two additional team members as determined by the campus (e.g., faculty member, student affairs representative, institutional researchers, academic administrator). The librarians participated as cohorts in a 14-month long professional development program that included team-based activities carried out on their campuses. Supported by a blended learning environment and a peer-to-peer network, the librarians led their campus team in the development and implementation of an action-learning project, examining the impact of the library on student success, and contributing to assessment activities on their campus. In January 2015, ACRL released a report synthesizing the project reports of the first 75 teams to participate in the AiA program. A report synthesizing the second-year projects was issued in fall 2015, "Academic Library Contributions to Student Success: Documented Practices from the Field." Additional reports were published in 2016 ("Documented Library Contributions to Student Learning and Success: Building Evidence with Team-Based Assessment in Action Campus Projects") and 2017 ("Academic Library Impact on Student Learning and Success: Findings from Assessment in Action Team Projects").

In 2011, the ACRL Plan for Excellence identified "Value of Academic Libraries" as one of three areas for strategic focus for 2011–2016. The goal is to have academic libraries demonstrate alignment with and impact on institutional outcomes.

Additionally, in 2011, ACRL established a standing committee on the Value of Academic Libraries to continue the association's commitment to and focus on this work. The Committee's first years have produced an active blog and a value bibliography. In 2015, ACRL began planning a research project in which a small number of questions would be replicated using the same research approach at a variety of academic institutions.

Research and Scholarly Environment

In 2002, ACRL embarked on a three-year scholarly communications initiative as one of its highest strategic

priorities; this initiative continues today through the work of ACRL's Research and Scholarly Environment Committee (which had been named the Scholarly Communications Committee until July 2012), established as a standing division level-committee. The committee coordinates the association's scholarly communications activities and hosts a discussion group for further exploration of these issues beyond the initial three-year launch of the program.

Addressing issues critical to the future of all academic libraries, the association works to reshape the current system of scholarly communications, focusing on education, advocacy, coalition building, and research. Broad goals of the initiative include creating increased access to scholarly information; fostering cost-effective alternative means of publishing, especially those that take advantage of electronic information technologies; and encouraging scholars to assert greater control over scholarly communications.

ACRL has partnered with the Association of Research Libraries (ARL) and the Scholarly Publishing and Academic Resources Coalition (SPARC) signing on to letters in support of a number of calls for broader access to scholarly works, including several regarding the National Institute of Health's (NIH) policies on open access for federally funded research. ACRL and SPARC partnered to offer an invitational only webcast to prepare committed grassroots advocates to take action in 2007. ACRL has participated in the Information Access Alliance (IAA) and the Open Access Working Group (OAWG), cosponsoring a symposium on anti-trust issues.

ACRL partnered with ARL to create the ARL/ACRL Institute on Scholarly Communication, which offered its signature event in July 2006, December 2006, and July 2007. This immersive learning experience prepares participants as local experts within their libraries and equips them with tools for developing campus outreach strategies. ACRL and ARL formalized their agreement and offered the first licensed regional institute for December 2007 and a second in December 2008. A regional event allows the ACRL to support institutions that would not, for whatever reason, attend a national event. This move to a regional event as a natural evolution in the life of the institute will enable the ACRL to refocus its national efforts to meet the changing needs of the library community. Under the ARL/ACRL Institute on Scholarly Communication name, ARL and ACRL also jointly offered an in-person workshop in conjunction with the ACRL 2009 Conference, an 8-part webinar series in 2010, and in-person workshops in conjunction with ACRL 2013, ACRL 2015 and the Library Assessment Conference.

In May 2009, the Board identified six as strategic priorities for 2009–2013, one of which was to, “enhance ACRL members’ understanding of how scholars work and the systems, tools, and technology to support the evolving work of the creation, personal organization, aggregation, discovery, preservation, access and exchange

of information in all formats.” Given this focus and the perceived need to help members of the profession develop a basic awareness and understanding, ACRL invested in this workshop to extend the reach from a one-off workshop to a subsidized travelling program, now called “the road show.” In its seventh year, and with the 2014 workshops completed, the road show will have visited 26 different states, the District of Columbia, 1 U.S. territory, and 1 Canadian province. The 36 workshops offered over the program's six year will have reached over 2200 participants from over 600 colleges and universities. Additionally, in summer 2014, the presenters began offering webinars through ACRL eLearning that allow for deeper exploration of specific topics.

ACRL and ARL partnered with SPARC to offer 4 webcasts on author rights during Fall 2006–Spring 2007. ACRL again partnered with SPARC to offer a full-day institute in conjunction with ALA MW 2015 on Tackling Textbook Costs Through Open Educational Resources: A Primer. ACRL convened an invitational meeting in July 2007 to collectively brainstorm the evidence needed to inform strategic planning for scholarly communication programs. In November 2007, ACRL issued a resulting white paper, “Establishing a Research Agenda for Scholarly Communication: A Call for Community Engagement.”

In 2009, ACRL joined the Library Copyright Alliance (LCA) and submitted briefs and comments for the courts and the Department of Justice regarding the proposed Google Book Settlement. LCA has submitted other amicus briefs of the court, as appropriate, to support the doctrine of fair use. Other action through the LCA include communicating concerns to the U.S. Trade Representative on the Anti-Counterfeiting Trade Agreement, releasing issue briefs on international copyright and the legal status of streaming films, supporting the U.S. statement on copyright exceptions for the blind and visually impaired before the World Intellectual Property Organization. In November 2012, LCA convened an invitational meeting in Washington, D.C., with approximately 20 library leaders in order to explore, articulate, and prioritize anticipated copyright-related issues facing the library community. The purpose of the meeting was to develop an appropriate strategy with articulated priorities to help inform the library associations' work.

In 2011, ACRL appointed a visiting program officer to develop a robust and sustainable model for the Scholarly Communications 101 road show workshop, support the work of the Scholarly Communications Committee, and develop other initiatives to advance ACRL's work in this area.

In 2011, the ACRL Plan for Excellence identified “Research and Scholarly Environment” as one of three areas for strategic focus for 2011–2016. The goal is to have academic librarians accelerate the transition to a more open system of scholarship. The objectives were revised in 2017 as follows:

1. Increase the ways ACRL is an advocate and model for open dissemination and evaluation practices.
2. Enhance members' capacity to address issues related to scholarly communication, including but not limited to data management, library publishing, open access, and digital scholarship.
3. Increase ACRL's efforts to influence scholarly publishing policies and practices toward a more open system.

In March 2013, ACRL published the white paper, "Intersections of Scholarly Communication and Information Literacy: Creating Strategic Collaborations for a Changing Academic Environment," written by a working group of leaders from many areas of the association. A formal task force was charged in October to promote its use. Also in 2013, members of the Research and Scholarly Environment Committee (formerly Scholarly Communications Committee) began to update content in the popular scholarly communication toolkit and migrated from Drupal to WordPress. It is routinely promoted in September in advance of October's Open Access Week.

In June 2015, the ACRL Board approved funding for curriculum design of two new ACRL licensed workshops to follow the popular "road show" model and ACRL now offers workshops on data management and the intersections of scholarly communication and information literacy.

Student Learning

ACRL has undertaken a number of initiatives related to information literacy. For those working in information literacy, ACRL supports programs in the areas of professional development, assessment, and instructional development. Spearheading many of these programs was the Institute for Information Literacy (IIL). IIL was charged with preparing librarians to become effective teachers in information literacy programs; supporting librarians, other educators, and administrators in taking leadership roles in the development of information literacy programs; and forging new partnerships within the educational community to work toward information literacy curriculum development. Conceptualized by Cerise Oberman, dean of libraries at SUNY Plattsburgh, the Institute for Information Literacy (IIL), was established by the ACRL Board at the 1997 ALA Annual Conference under the name National Information Literacy Institute. IIL is now known as the Student Learning and Information Literacy Committee (SLILC) and the Immersion program is now coordinated by the Immersion Program Committee.

ACRL approved the "Information Literacy Competency Standards for Higher Education" at Midwinter 2000. In response to inquiries from members about their use on campuses, a training program was developed and was made available to members during Annual

Conferences and Midwinter Meetings. In 2016, the Board approved the "Framework for Information Literacy for Higher Education" and rescinded the "Information Literacy Competency Standards for Higher Education."

A visiting program officer for information literacy was hired to develop educational content to help the profession use the Information Literacy Framework and those outside the profession to understand its application to the curriculum.

Many ACRL sections have developed discipline-specific standards for information literacy including "Information Literacy Standards for Science and Technology," (approved in 2006), "Research Competency Guidelines for Literatures in English" (approved in 2007), "Information Literacy Competency Standards for Anthropology and Sociology," "Political Science Research Competency Guidelines" (approved in 2008), "Psychology Information Literacy Standards" (approved 2010), "Information Literacy Standards for Teacher Education" (approved in 2011), "Visual Literacy Competency Standards for Higher Education" (approved in 2011), "Information Literacy Competency Standards for Journalism Students and Professionals" (approved in 2011), "Information Literacy Standards for Teacher Education" (approved 2011), "Information Literacy Standards for Nursing" (approved 2013). ACRL has also reviewed information literacy standards for music developed by the Music Library Association.

ACRL has also developed a number of standards to assist practitioners in developing and maintaining strong educational programs including: "Guidelines for Instruction Programs in Academic Libraries" (approved 2011), and "Characteristics of Programs of Information Literacy that Illustrate Best Practices: A Guideline" (first approved in June 2003 and revised in 2012).

Grant-funded projects

In 2000, ACRL received a \$150,000 National Leadership grant from the Federal Institute of Museum and Library Services to develop tools and training to help librarians better assess student learning outcomes in information literacy courses. The work of 30 librarians and their campus teams in implementing and assessing information literacy courses was widely disseminated through presentations and publications.

In 2006, ACRL's Rare Book and Manuscript Section (RBMS) received funding from IMLS to offer scholarships to newer and aspiring professionals in these fields to its annual conference, which in 2006, has a special focus on issues of mutual interest to special collections librarians, archivists, and museum professionals. A total of 33 attendance scholarships were offered with preference given to applicants from professionally underrepresented backgrounds. The purpose was to increase the conference participants' knowledge of allied fields and increase their interest in communicating and collaborating with allied

professionals. In addition, the aim was to stimulate scholarship recipients to show greater interest in pursuing or continuing a career as special collections librarians, archivists, or museum professionals.

In 2011, ACRL's RBMS members were also instrumental in getting a small (\$3000) grant from the Gladys Krieble Delmas Foundation to support the mounting of back files of *Rare Books and Manuscripts Librarianship* on the *RBM/HighWire* website. The Gladys Krieble Delmas Foundation generously awarded ACRL/RBMS \$5000 in 2013 and \$8000 in 2017 to support scholarships to attend the annual RBMS conference.

In 2011, ACRL, together with three partners—the Association for Institutional Research, Association of Public and Land-grant Universities, and the Council of Independent Colleges—was awarded an IMLS grant from the Federal Institute of Museum and Library Services for a National Leadership Collaborative Planning Grant Level II. The project entitled “Building Capacity for Demonstrating the Value of Academic Libraries” had a budget total (direct and indirect) of: \$162,076, with the Grant subtotal: \$99,985 and Cost Share subtotal: \$62,091. The grant covered costs to convene two national summits in late fall 2011, to determine the professional competencies that librarians need. College and university chief academic officers, senior institutional researchers, representatives from accreditation commissions and higher education organizations, and academic librarians attended the summits to share their best thinking.

In 2012, ACRL was awarded a follow-up National Leadership Demonstration Grant of \$249,330 by the IMLS for the three-year program “Assessment in Action: Academic Libraries and Student Success” (AiA). The grant funded a professional development program to strengthen the competencies of librarians in campus leadership and data-informed advocacy.

Public Policy Advocacy

In September of 1997, the Association of College and Research Libraries (ACRL) in concert with the ALA Washington Office embarked upon its public policy initiative. The goal was to educate academic librarians about legislative/public policy issues pertinent to academic libraries and higher education. ACRL staff, the ACRL Government Relations Committee, the ACRL Research and Scholarly Environment Committee, the *ACRL Legislative Network*, the ACRL Board, the ALA, Washington Office, and other appropriate ACRL entities carry out the advocacy work. These groups work together to develop a legislative agenda that identifies ACRL policy priorities.

ACRL communicates information on its policy priorities via many means. A Legislative Network consisting of a representative from each of the 42 ACRL chapters and an electronic distribution list (LEGNET) was established

to share the legislative agenda with other ACRL members, their institution's administration and their congressional representative. Information on issues is also disseminated using the ACRLLeads electronic distribution list, *C&RL News*, flyers, letters, and the ACRL Legislative web site (<http://www.ala.org/acrl/issues/washingtonwatch>). When the ALA conference takes place in Washington, D.C., ACRL has offered advocacy preconferences designed to acquaint academic librarians with federal legislative issues and to equip them with the skills needed to deliver effective messages to congressional representatives. ACRL also encourages participation in ALA Legislative Day, and has, in the past, provided travel grants for first time attendees and hosted a special luncheon to highlight issues of importance to academic librarians.

The Board approved the recommendations of ACRL's Task Force on National Advocacy at the 2005 Midwinter Meeting. To supplement the existing ACRL Legislative Network, ACRL created a new position of Legislative Advocate. Legislative Advocates work as much as possible with other library legislative efforts in the state or region. 45 Legislative Advocates served in the inaugural group, appointed in Spring 2007. ACRL hired a short-term Visiting Program Officer Michael McLane in late 2007 to expand the program, organize training opportunities, and undertake assessment. This program has since been phased out as sophisticated web-enabled “action alerts” have made it easier to communicate directly with librarians in specific congressional districts.

In 2009, ACRL joined the Library Copyright Alliance and has been active in submitting briefs and comments to courts and agencies as appropriate. ACRL is also active in the Open Access Working Group, a coalition to promote legislative and policy that would expand access to results of publicly funded research. ACRL regularly releases a legislative agenda in conjunction with National Library Legislative Day. The 2017 agenda includes federal funding for libraries, network neutrality, privacy and government surveillance.

@Your Library Campaign and Grassroots Advocacy

Although generally viewed positively, libraries are often taken for granted. Recognizing this challenge, in 2001, the American Library Association launched The Campaign for America's Libraries, a five-year commitment, to speak loudly and clearly about the value of libraries and librarians to our communities, schools, academic institutions, and businesses, as well as to our society, democracy, and the new digital age. Based on research and crafted to target key audiences, The Campaign worked to raise public understanding that libraries are dynamic, modern community centers for learning, information, and entertainment. The campaign was designed to

heighten awareness regarding the vibrancy, vitality, and real value of today's libraries, to galvanize public support, and influence public policy. Working under the umbrella of the American Library Association @Your library campaign, ACRL led the effort to develop a public relations campaign for academic libraries. Consumer research was undertaken in order to develop promotional materials. A toolkit was developed, mailed to all ACRL members, distributed at the 2003 ACRL Conference.

ACRL also launched a multiyear effort to emphasize the importance of academic libraries and librarians to the higher education community. A series of ads, focusing on the exciting things happening @Your library, was placed in *The Chronicle of Higher Education* beginning in 2001. Testimonials from faculty, students, and administrators were an important component of this campaign. ACRL's Excellence in Academic Libraries award winners have also been recognized in the ads. In 2003, the Board established the Marketing Academic and Research Libraries (MARL) Committee to continue developing @Your library campaign tools for academic and research libraries and to eventually update the toolkit. In 2005 and 2007, MARL presented a Best Practices in Marketing @Your library Award. In early 2010, MARL launched the ACRL Marketing Minute, a biweekly series of quick tips and insights on marketing research, trends, and data delivered through Facebook and Twitter.

ACRL President Camila Alire continued efforts to emphasize the value of academic and research libraries and librarians during her presidential year in 2006. A grassroots advocacy toolkit focusing on "The Power of Personal Persuasion" was developed and mailed to every ACRL member. ACRL President Pamela Snelson continued the advocacy role by commissioning research on what senior academic administrators expect from librarians, and subsequent ACRL Presidents have also focused on advocacy.

ALA ended the Campaign for America's Libraries in 2015, and ACRL continues its advocacy for academic libraries through the ALA Libraries Transform campaign.

Recruitment to the Profession

Professional associations such as the American Library Association, the Association of College & Research Libraries, the Association of Research Libraries (ARL), and state-based associations are key stakeholders in recruitment and retention efforts. The work of the profession is changing and association can help in recruiting talented individuals and in providing training to those already in the profession. Over the years, ACRL has undertaken a number of initiatives. The Personnel Administrators & Staff Development Officers Discussion Group of the Association of College & Research Libraries (ACRL) established the Ad Hoc Task Force on Recruitment & Retention Issues in early 2001 to examine how academic libraries can successfully recruit

and retain professionals in an increasingly competitive environment. In 2002, ACRL and ARL formed a joint task force to work on recruitment issues. A short video, "Faces of a Profession @Your Library" highlighting the benefits of careers in academic and research libraries, was developed under the Task Force's leadership. This video is freely available for downloading from the web.

In 2007, ACRL released "Achieving Racial and Ethnic Diversity among Academic and Research Librarians: The Recruitment, Retention, and Advancement of Librarians of Color," a white paper commissioned by the ACRL Board of Directors working group on diversity. Building on the 2002 ACRL white paper, "Recruitment, Retention & Restructuring: Human Resource in Academic Libraries," the authors discuss efforts to promote, develop, and foster workplaces that are representative of a diverse population, along with addressing the development of a workplace climate that supports and encourages the advancement of librarians from underrepresented groups.

In 2003, ACRL founded the ACRL Spectrum Mentor Program and committee to encourage ALA Spectrum LIS students to pursue academic librarianship. To date, ACRL has contributed \$102,500 to the ALA Spectrum program, sponsoring 12 Spectrum Scholars, and has also matched more than 120 Spectrum Scholars with an ACRL member mentor. More than 20 Spectrum Travel Grants consisting of registration and a travel stipend have also been awarded to help scholars attend every ACRL Conference since 2005, with a total value of more than \$20,000.

Summits

- *Summit on Technology and Change in Academic Libraries*—In November 2006, ACRL convened a roundtable of librarians, higher education administrators, publishing, and information industry leaders to address how technologies, on the one hand, and the changing climate for teaching, learning, and scholarship, on the other, will likely recast the roles, responsibilities, and resources of academic libraries over the next decade. One of the outcomes of the roundtable was a roadmap for ACRL to help its members deal with the ongoing changes in the profession and the academy. A white paper entitled "Changing Roles of Academic and Research Libraries" was posted to the ACRLog. Then Vice-President Julie Todaro provided a detailed response to the essay and invited others to comment.
- *Stepping Through the Open Door: A Forum on New Modes of Information Delivery in Higher Education*—In March 2007, ACRL joined EDUCAUSE and the National Association of College Stores to jointly sponsor an invitation-only forum focused on changing roles within higher education. An article from a participant appeared in *C&RL News* and the report was issued by the conveners in September 2007.

- *Building Capacity for Demonstrating the Value of Academic Libraries*—The summits convened in 2011 as part of ACRL's Value of Academic Libraries Initiative, are described in the "Value of Academic Libraries" section of this chapter.
- *Forum on Data Management*—In January 2014, ACRL hosted a forum on data management with Drexel University Libraries. The goal of this forum was to have a dialogue between disciplinary faculty and academic librarians on the management, curation, and sharing of research data. The faculty agreed that they would want to share most of their data, although they allowed for the possibility that some data might need to remain private for a period of time, depending on the nature of the data and whether or not the scholar was still working with it. They saw strong roles for librarians including providing consultation on data management plans, curation, and long-term preservation of data. ACRL offered two workshops on data management in 2015 and now offers a licensed workshop.

COMMITMENT TO PROFESSIONAL DEVELOPMENT AND GROWTH

ACRL supports and enhances the professional development and growth of academic and research librarians through its numerous professional development activities.

ACRL Conferences

On its 40th birthday in 1978, ACRL took a giant step forward by convening its first National Conference, distinct from ALA, in Boston. The conference featured a 3-day program of major addresses and research papers that attracted 2625 participants. Participants praised the conference for focusing on academic librarianship, for stimulating research on the issues facing academic librarianship, and for bringing together librarians with a common professional interest in academic libraries.

The conference, now held every odd year and begun primarily as an outlet for presenting formal research papers, has responded to member interests and changes in the profession by diversifying its content over the years and attracting a more global audience. ACRL dropped the "National" from the Conference name in 2011, as the conference now welcomes attendees from over 26 countries. New programming has been developed by adding panel sessions, by inviting noted leaders to write papers on current topics, by adding more opportunities for networking and informal dialogue (e.g., roundtable discussions, dinner with colleagues), and by engaging attendees more actively in the learning process with a wider range of session formats. The 1999 National Conference offered first ever "conference-within-a-conference" on the topic of student learning

and the first live Web broadcast. The 2005 conference saw the first full-fledged Virtual Conference offered in conjunction with a National Conference. The 2007 conference held the first Cyber Zed Shed, now known as TechConnect Presentations, which demonstrate technology-related innovations. IdeaPower and THATCamp formats were added to the 2011 and 2013 conferences, respectively, to allow for more late-breaking and spontaneous generation of content.

Interest in presenting at the conference has steadily increased since 1978. Typically the conference will feature about 84 contributed papers, 60 panel sessions, 6–7 preconferences, 16 workshops, 30 TechConnect presentations, 200 poster sessions, and 100 roundtable discussions. Acceptance rate, on average, has been around 20–30%, depending on the proposal type. Attendance at the conference has climbed over the past few years with about 3000 attendees, 1000 exhibitors, and 500 virtual participants for each biennial conference. Slidecast recordings have been available on demand to broaden the reach to those unable to attend or those who want to review F2F content again after the conference. ACRL also launched its first Virtual Conference online community in 2005, and has continued the practice since to allow attendees the opportunity connect and access the conference content for up to one year after the event.

Since its first Conference in 1978, ACRL has gone on to hold successful conferences in Minneapolis (1981, 1881 participants), Seattle (1984, 1754 participants), Baltimore (1986, 2309 participants), Cincinnati (1989, 2735 participants), Salt Lake City (1992, 2241 participants), Pittsburgh (1995, 2721 participants), Nashville (1997, 2973 participants), Detroit (1999, 3080 participants), Denver (2001, 3388 participants), Charlotte (2003, 3427 participants), Minneapolis (2005, 3946 participants), Baltimore (2007, 4784 participants), Seattle (2009, 4321 participants), Philadelphia (2011, 5312 participants), Indianapolis (2013, 4824 participants), Portland (2015, 5072 participants) and Baltimore (2017, 5200 participants).

The ACRL 2019 Conference, "Recasting the Narrative," will be held in Cleveland, Ohio, April 10–13, 2019.

E-Learning

ACRL offers online courses that provide low-cost continuing education opportunities for librarians in a format that allows them to work around their busy schedules. Courses are typically 3 weeks long and include real-time and asynchronous activities. Current offerings include, "Designing Curriculum and Developing Educators for the Information Literacy Courses of Tomorrow."

In 2004–2005, ACRL also began offering live webcasts, providing participants with interactive learning experiences on topics such as information literacy, standards, scholarly communication, and distance learning. Webcasts typically last 60–90 min and feature a live audio

presentation accompanied by PowerPoint slides, web sites, and other resources. Participants can interact with instructors through text chat, asking questions using a microphone, and responding to polls. ACRL established a group registration rate for webcasts in April 2006. The group rate allows an institution to register multiple people and project the session to participants in the same location. ACRL introduced e-learning scholarships in 2010 and were supported again in 2011 and 2012. In FY12, five scholarships that covered the cost of a webcast registration fee (\$50 each) and five scholarships that covered the cost of a multi-week course (\$135) were awarded. In partnership with TLT Group in the 2000s, ACRL offered a three-part online information literacy seminar series, featuring webcasts on assessment, collaboration, best practices, and information literacy resources.

For the fourth time, ACRL offered a multi-day online-only professional development institute in the spring of a nonnational conference year. The 2012 Spring Virtual Institute, "Extending Reach, Proving Value: Collaborations Strengthen Communities," featured a keynote presentation, concurrent live webcasts, and asynchronous lightning talks. The SVI program explored how libraries of all types are capitalizing on community collaborations. As the webcasts increased, interest in a multiday, themed virtual conference decreased, so additional virtual institutes have not been planned.

In spring 2008, ACRL offered its first Springboard Event. The 90-min Springboard webcast, now an annual program, is available for free to the full ACRL membership, with the archived content available afterwards to the world via the web. Approximately 230 ACRL members participated in ACRL's 3rd annual Springboard webcast featuring John Palfrey, Henry N. Ess III Professor of Law, Vice Dean, Library and Information Resources, Harvard Law School, and Faculty Co-Director, Berkman Center for Internet & Society, and co-author of "Born Digital: Understanding the First Generation of Digital Natives." The topic of privacy was chosen in conjunction with ALA's Office of Intellectual Freedom's inaugural "Choose Privacy Week."

ACRL and Choice have teamed up to offer sponsored webinars which have proven to be an attractive vehicle for communication between librarians and vendors. The ACRL/CHOICE webinar series have proven popular with librarians, too, with hundreds of librarians registering for each event.

Leadership

With the quantity of information growing exponentially and the expansion of technology into all aspects of the educational process, higher education is looking for those who can lead the way in utilizing these new tools wisely and navigate the numerous challenges facing us all. It is more important than ever for academic librarians to step

up and guide administrators, faculty, and students through the minefields of this new information environment.

ACRL takes its responsibilities for developing leaders seriously. Since 1999, it has partnered with the Harvard University Graduate School of Education to offer a 5-day institute designed to increase the ability of library directors to lead and manage. The Institute helps participants to assess their own leadership capabilities and to analyze how well their own organizations are positioned to meet current and future challenges. Sessions focus on such topics as managing change, human resources, applying technology, team building, and staff motivation. Learning is through the case study method. ACRL held reunions for the alumni of this program at the Midwinter Meeting during the early/mid-2000s and reoffered a reunion at the 2017 Midwinter Meeting. In addition, ACRL partnered with Harvard to offer the Advanced Leadership Institute for Senior Academic Librarians. This new institute was designed exclusively for senior library leaders and alumni of the Leadership Institute for Academic Librarians and addressed critical leadership issues including collaboration and alliances, influence and leadership, managing expectations of presidents and provosts, and the future role of the academic library. The program was offered in March 2008. While programmatically successful, the recessionary economy dampened registration for the March 2010 session and it was cancelled, but was held in March 2012.

In addition, ACRL collaborated with six other higher education associations to offer the Women's Leadership Institute in December 2008. This unique program brought together mid-level administrators from across campus functions to share experiences, develop a better understanding of the campus as a workplace and culture, and create new networks and networking skills. The success of this endeavor led the associations to offer it the program again and ACRL has participated annually since the initial offering. The next Women's Leadership Institute will be offered on December 3–6, 2017.

Mentoring and Training Programs

Recognizing the importance of training and mentoring, ACRL developed the Academic Library Internship for Administrators of Black College Libraries, an internship program for librarians of predominantly black institutions. In December 1973, the Andrew W. Mellon Foundation agreed to underwrite the program with grants totaling \$350,000. During the four-year period of the program (1974–1978), 25 librarians from predominantly black institutions of higher education served as management interns for periods of 3–9 months at nationally known academic libraries. The evaluation conducted at the end of the program suggests that the interns carried back to their home institutions a broad understanding of the management techniques and styles employed in large academic libraries. In 1987, ACRL received another grant from the Mellon Foundation

to conduct a planning project to assist staff in libraries of historically black colleges and universities.

Under the leadership of Larry Hardesty, the College Libraries Section developed a mentoring program for new college library directors, which is now in its twentieth year. In 2012, Irene Herold succeeded Hardesty as the President of the Board and a new Board was created, which consisted of seven former participants in the program. The faculty for the seminar is now led by Susan Barnes Whyte and Melissa Jados. The program had received funding from the Council on Library Resources, is now primarily self-supporting with participants bearing the costs, and is now a separate 501(c)3 program and is not an official ACRL project. Since its inception, over 333 first-year college library directors and over 152 experienced library directors have participated in the program.

The ACRL Board established the (ACRL Dr. E.J.) Josey Spectrum Scholar Mentor Committee in 2003, to provide conference programs on mentoring, recruit and maintain a pool of academic and research librarians to serve as mentors to Spectrum Scholars. In 2011, the E.J. Josey Spectrum Scholar Mentor Committee revised its mentor recruitment, requirements, and training to more effectively manage the mentor/Scholar matching process. The Committee has forged a strong relationship with the ALA Spectrum Scholar Program staff at ALA.

“Your Research Coach” was established in 2004–2005 by the CLS Research for College Librarianship Committee to help academic librarians with research and scholarly projects. The program provides mentoring to librarians whose institutions cannot offer such support, and who need to publish or present to attain tenure. As of 2015, there are 13 coaches, with 12 assigned, taking part in the program. The committee will open up the program to other sections, starting with the Instruction (IS) and Distance Learning (DLS) sections, once they are able to find more coaches.

Information Literacy Immersion Programs

The ACRL Information Literacy Immersion Program provides information literacy training and education for librarians in the areas of pedagogy and leadership. The popular 4.5 day “Classic” Immersion program provides two tracks for intensive training and education of librarians: 1) the teacher track, focusing on individual development for those who are interested in enhancing, refreshing, or extending their individual instruction skills; and 2) the program track, focusing on developing, integrating, and managing institutional and programmatic information literacy programs. A national faculty of 15 outstanding instruction librarians has been assembled to design, write, and teach the immersion program. The first immersion program was held in July 1999, at Plattsburgh State University of New York and was geared toward academic librarians. Since then, the program has been offered

annually with a total of 26 immersion programs training more than 1900 people have been held or licensed in California, Canada, Colorado, Florida, Illinois, Iowa, Massachusetts, Ohio, Rhode Island, Texas, Vermont, Washington, and Wisconsin. While most immersion programs have been held for librarians only, some have been developed to include both librarians and teaching faculty. In addition, ACRL licensed its first institutional-based Immersion program to Cornell University in FY12. The model was very successful and ACRL licensed a similar program to a Hong Kong academic library consortium in FY13, Yale University in FY14, and the Singapore academic library community in FY15.

In fall 2006, the Immersion faculty offered an addition to the Immersion program: “Intentional Teaching: Teaching: Reflective Practice to Improve Student Learning.” The Intentional Teaching program provides 3.5 days of learning and reflection for academic librarians and offers a mixture of structured and co-constructed learning segments such as peer discussions, individual reading, and reflection times, and participant-led communities of practice.

The ACRL Institute for Information Literacy announced another new addition to the Immersion program in 2008. The *Assessment: Demonstrating the Educational Value of the Academic Library* is intended for librarians active in teaching and learning and those with leadership roles for information literacy program development who want to improve their knowledge and practice of both classroom and program assessment. The inaugural Assessment Immersion Track was offered in December 2008.

A new structure to the Immersion Program was introduced in 2009. Intentional Teacher and Assessment tracks have been offered simultaneously since fall 2009, while Teacher Track and Program tracks continue to be offered together in summer. This new schedule blends immersion programs with similar formats and lengths to offer a more cohesive immersion experience.

Two new Immersion Programs were offered in FY13, “Practical Management for the Instruction Coordinator” and “Teaching with Technology & Instructional Design Program.” The Practical Management was reoffered in FY15.

Workshops and Preconferences

ACRL sponsors workshops, seminars, and preconferences at ALA conferences. Most notable in this area are the conferences developed by the ACRL Rare Books & Manuscripts (RBMS). For 55 year, RBMS has provided 3 days of programming for rare books, special collection, archives, and manuscripts librarians at its annual conference.

ACRL also offers a variety of programs through its extensive chapter network. Local and regional chapters

typically offer annual conference programming. To support these efforts, the ACRL Board of Directors has allocated funding for the ACRL president, vice-president/president-elect, and the executive director to visit ACRL chapters. Currently, funds to support 10 visits per year are budgeted. The ACRL Chapters Speakers Bureau fosters closer relations between the Association and its members by creating opportunities for leaders to share perspectives and concerns at the regional and national level.

Annual Conference Programs

As a means of addressing issues of concern and to increase the knowledge of academic librarians, ACRL units and members develop programs to present at the ALA Annual Conferences. ACRL Sections, interest groups, committees, and personal members submit program proposals to the ACRL office 9 months prior to the Annual Conference at which the program is to be presented. This includes programs that are not requesting funding, as well as those that are asking for funds. ACRL encourages its units to cosponsor programs with other ACRL or ALA units and outside organizations. The ACRL Professional Development Committee (PDC) reviews and selects programs for presentation.

The ACRL Board of Directors provides \$27,500 from ACRL's budget to support Annual Conference programs (including the ACRL President's Program and excluding cost of audiovisual equipment, which is largely paid for by ALA). The PDC determines how these funds are allocated among the program proposals. How well proposals meet the program criteria is one of the determining factors in whether it is funded or not.

Career and Job Services

ACRL offers three ways for academic librarians to find out about career opportunities and for employers to build a pool of highly qualified individuals from which to recruit for vacant positions: 1) as the only magazine targeted specifically to academic/research librarians, *College & Research Libraries News (C&RL News)* is a print vehicle to advertise in print academic library job listings; 2) the ALA JobLIST online career center (joblist.ala.org), launched in 2006, is a joint project of *American Libraries (AL)* magazine, *C&RL News*, and ALA's Office for Human Resource Development and Recruitment (HRDR), which incorporates the formerly separate *AL* and ACRL job sites and many services of HRDR, including placement services at the ALA Midwinter Meeting and Annual Conference; and 3) at each ACRL Conference, the association works with HRDR to offer a job placement service. Since 2009, JobLIST has also maintained an active presence on social media sites, including Facebook, Twitter, and LinkedIn. Content shared on these sites includes notifications of new job listings, news items specifically about

the job market for librarianship, and general job searching tips and strategies. In 2011, a free biweekly e-newsletter, *ALA JobLIST Direct*, was also launched to reach yet another target audience with a selection of job search and career advice content, as well as promoting the online service.

ACRL Consulting Services

ACRL has offered library consulting services to member and non-member libraries since 2007. ACRL consultants have worked to provide services including external reviews, staff retreats, and strategic planning facilitation for Appalachian State University, Arkansas State University, Association of Academic Health Sciences Libraries (AAHSL), Buffalo State University, California State University – San Marcos, Center for Research Libraries, Central Michigan University, Chadron State College, Community College of Philadelphia, Dominican University, Duquesne University, Fairleigh-Dickinson University, Georgia College, Gonzaga University, Hampshire College, Kean University, Lamar University, Lewis University, Louisiana Tech, Loyola University, MIT, Mount Holyoke, New Mexico Institute of Mining and Technology, New Mexico State University, North Park University, Northeastern Illinois University, Our Lady of the Lake University, Purdue University, St. Xavier University, SUNY Council of Library Directors, Texas A&M, Triangle Research Libraries Network (TRLN), Tufts University, University of California – Merced, University of California – Riverside, University of California – San Diego, University of Illinois at Chicago, University of Kansas, University of Maryland Baltimore County, University of North Carolina - Charlotte, University of Puerto Rico, University of Saint Francis, University of Wisconsin – Milwaukee, University of Wisconsin – Stout, Western Michigan University, and Wheaton College. ACRL staff consultants, Kathryn Deiss and Kara Malenfant, authored a chapter, "Successful external reviews: Process and practicalities," for *Reviewing the Academic Library: A Guide to Self-Study and External Review*, which guides library leaders and external reviewers in planning and conducting an external review and effectively using the results for future planning.

Building the Knowledge Base

ACRL strives to be a national and international interactive leader in creating, expanding, and transferring the body of knowledge of academic librarianship. One of the principle motives for creating a separate unit for academic librarians in 1938 was to stimulate research and publication in academic librarianship. The ALA First Activities Committee, a body appointed in the 1920s to review the activities and structures of ALA, reported in 1928 that the ALA publishing program had neglected scholarly and

bibliographic publication, the areas of greatest interest to academic librarians. This neglect, said the committee's report, had been so extensive "as to threaten at times actual withdrawal of the College and Reference Section from A.L.A."^[19]

C&RL and C&RL News

A year after its creation in 1938, ACRL established an official journal called *College & Research Libraries* (*C&RL*). The first issue of the new quarterly publication appeared in December 1939. It was at one and the same time a professional journal, an official organ of ACRL, and a vehicle for the exchange of news about libraries and librarians. A. F. Kuhlman, the first editor of *College & Research Libraries*, believed that "the absence of a professional journal devoted specifically to the interests of college, university, and reference libraries . . . no doubt accounts to a large extent for the lack of a definitive literature dealing with these institutions."^[20] Under a series of able editors, from Kuhlman in the 1940s to Wendi Arant Kaspar who assumed the editorship in 2016, *C&RL* established itself as a premier scholarly journal for the publication of empirical research in academic librarianship and helped to build a body of knowledge and intellectual technique for the academic library profession. In 1950, Arthur Hamlin, then ACRL's executive secretary, called *C&RL* "the principal jewel in the Association crown."^[21]

The ACRL Board of Directors decided in 1951 to make *College & Research Libraries* a membership benefit so that all members would receive the journal without charge. This far-reaching decision made it possible for *C&RL* to play a key role in unifying the association and the profession. In light of the growing quantity and quality of research about academic librarianship, the Association decided in 1956 to publish *C&RL* on a bimonthly rather than a quarterly basis. The Board approved making *C&RL* an open access publication starting in April 2011.

At the 2012 ALA Annual Conference, the Board approved transitioning *C&RL* to an online-only publication beginning with the January 2014 issue.

In November 2011, the University of Illinois at Urbana-Champaign began a volunteer project to digitize the remaining backfiles of *C&RL*. The back content was added to the main *C&RL* website during the 2012–2013 fiscal year. All current content and complete back issues, beginning in 1939, are freely available to the public on publication website at <http://crl.acrl.org>. The ACRL Board of Directors expressed their thanks to Illinois for this generous contribution through a formal resolution.

In 1967, the people and news portions of *C&RL* were separately published, allowing the journal to focus on its role as a scholarly journal. Since 1967, *College & Research Libraries News* has served as the official magazine of record of the association and as a clearinghouse for news about academic libraries, librarians, and higher education. A history of the first 30 year of *C&RL News* appeared in the September 1996 issue as part of an anniversary celebration. In 1993, *C&RL News* became the first ALA print publication available through the Internet. In 2002, *C&RL News* began offering an electronic contents service and, also in 2002, *ACRL Update*, an electronic biweekly news publication, was launched to provide more current information and news. RSS feeds of *C&RL News* contents were launched in 2008. The full text of all *C&RL News* articles from 2004 to the present is freely available to all on the web at <http://crln.acrl.org>.

In January 2010, the online versions of ACRL's three serial publications (*C&RL*, *C&RL News*, and *RBM*) moved to a new home through a partnership with HighWire Press. The move of ACRL's publications from the association website to the HighWire platform provided a number of benefits, including improved search capabilities both within and across publications, increased Web 2.0 functionality, and online access for individual and institutional non-member subscribers.

ACRL Publications in Librarianship. In 1952, ACRL began the ACRL Monographs series. By 2014, the series had grown to 66 titles and is now called ACRL Publications in Librarianship. The first volume in the series was Joe W. Kraus's *William Beer and the New Orleans Public Libraries, 1891–1927*. PIL #58, *Centers for Learning* (Elmborg & Hook) won the 2007 Ilene E. Rockman Publication of the Year Award. Recent titles include *Interdisciplinarity and Academic Libraries* (PIL #66, Mack & Gibson 2012), and *The Changing Academic Library, 2nd Edition* (PIL #65, Budd 2012: *Not Just Where to Click: Teaching Students How to Think About Information* (Swanson and Jagman, Editors), *Assessing Liaison Librarians: Documenting Impact for Positive Change* (Mack and White, Editors), and in Fall 2015, ACRL issued what could be the final PIL volume: PIL #69, *Leadership Development Programs for Academic Libraries* (I.M.H. Herold, Editor).

Choice

Founded in 1963 with a grant from the Council on Library Resources, Choice is the Middletown, Connecticut-based publishing unit of ACRL with an annual operating budget of more than three million dollars. In 2008 the ACRL and ALA Boards approved the purchase of office space for

Choice in the form of a condominium located on Main Street in Liberty Square. In 2009 Choice moved into its top floor space. The design is LEED-certified by the U.S. Green Building Council. Choice is the publisher of Choice magazine, the premier U.S. academic review journal; *Choice Reviews*, a continuously updated database of our reviews; and other publications, described below.

Choice360

The Choice website, www.choice360.org organizes our content and provides librarians with an easy way to view our webinars, download bibliographic essays, listen to our podcasts, get free trials for our subscription products, or contact our editorial staff. It also features the “The Open Stacks” blog, which publishes a wide variety of Choice content.

Choice Reviews. *Choice's* concise, critical, and authoritative reviews have been called “the best short critical evaluations of new titles available anywhere.” By a wide margin, subscribers rate *Choice* #1 among the review sources they use to select materials for academic libraries. *Choice Reviews* (www.choicereviews.org) contains every review published by the Choice staff since September 1988, with some 6000 records added each year. Updated daily, the database functions both as a collection-development resource for academic libraries and as a discovery tool for bibliographic research by students and researchers.

Choice. *Choice* magazine has been in continuous publication since 1964. In addition to its reviews, *Choice* is home to “Ask an Archivist,” a series of interviews with curators of special collections; guest editorials; lists of forthcoming titles in various disciplines; an annual guide to academic book pricing; the “University Press Forum”; and the “Digital Resources Buying Guide,” published each August. *Choice's* highly esteemed Outstanding Academic Titles list, representing the “best of the best” new titles reviewed during the preceding year, is published each year in January and is widely regarded as comprising the essential titles for purchase by undergraduate libraries. *Choice* reviews are also available under license in other widely used products and services.

ccAdvisor. A collaboration between Choice and The Charleston Company, *ccAdvisor* (www.ccadvisor.org) is a new review service dedicated to the identification and assessment of academic databases, web sites, and tools. Each review features a scoring matrix that rates resources by the quality of their content, user experience, price, and purchase and contract options.

Resources for College Libraries. Released in 2006, *Resources for College Libraries* (www.rclinfo.net) is the

digital successor to *Books for College Libraries*, 3rd edition. The product of a collaborative effort between Choice and ProQuest, RCL is published under the direction of more than seventy subject-area experts, who update the work on an annual basis, and lists almost 90,000 works across 61 curricular areas. With the publication of its companion product, *Career Resources*, in 2009, RCL now includes over 4500 core works for vocational-technical subjects as well.

Choice Bibliographic Essays

Written by subject area experts, these comprehensive essays contain discussion and annotation on hundreds of titles. Essays from recent years are available on the LibGuides platform (www.ala-choice.libguides.com).

The Authority File

In 2017 Choice launched, “The Authority File: A Choice podcast,” which features weekly episodes of author/editor conversations about new books and products, thought-leadership interviews and discussions, and technology and product case studies.

ACRL-Choice Mobile App

The ACRL-Choice app allows users to interact with ACRL content in a new and more convenient way, with articles, blog posts, webinars, and other content conveniently organized around membership and community, professional development, and content development.

RBM: A Journal of Rare Books, Manuscripts, and Cultural Heritage

RBM, a semiannual publication, began in the spring of 1986 as *Rare Books and Manuscripts Librarianship (RBML)* on a trial basis under the leadership of the Rare Books and

Manuscripts Section. The journal was incorporated into the ACRL publishing program in 1988. In 2000, the journal underwent a major revision, including a new name, a new graphic treatment, and a new editorial focus. The editorial focus was broadened to include all types of special collections in a variety of media in order to address the broad range of issues and concerns of professionals who work with such collections. Full contents of the past 12 months of *RBM* are available online to subscribers at <http://rbm.acrl.org>. Contents older than the past 12 months are freely available to all. Thanks to a generous grant from the Gladys Krieble Delmas Foundation, the complete backfiles of *RBML* were digitized and added to the publication website in spring 2011.

ACRL Nonserial Publications

Monographic works pertinent to academic and research librarianship are published by ACRL. ACRL publishes books on a broad spectrum of topics. ACRL has worked to challenge standard publishing models and has experimented with open access and digital publications as well as traditional publications. Typically, ACRL publishes 8–12 titles annually, each with an intended audience of 500–1500. The publications program is intended to be self-supporting.

Titles published in 2016-2017 include: *2016 Academic Library Trends and Statistics*, *2015 Academic Library Trends and Statistics*, *Bridging Worlds: Emerging Models and Practices of U.S. Academic Libraries Around the Globe* (Pun, Collard, and Parrott, Editors), *Choosing to Lead: The Motivational Factors of Underrepresented Librarians in Higher Education* (Olivas, Editor), *Critical Library Pedagogy Handbooks—Vol. 1: Essays and Workbook Activities and Vol. 2: Lesson Plans* (Pagowsky and McElroy, Editors), *Collaborating for Impact: Special Collections and Liaison Librarian Partnerships* (Totleben and Birrell, Editors), *Creative Instructional Design: Practical Applications for Librarians* (West, Hoffman, and Costello, Editors), *Curating*

Research Data—Vol. 1: Practical Strategies for Your Digital Repository and Vol. 2: A The First-Year Experience Cookbook (Pun and Houlihan, Editors), *Handbook of Current Practice* (Johnston, Editor), *Librarians: Exploring Selves, Cultures, and Autoethnography* (Deitering, Stoddart, and Schroeder, Editors), *Mobile Technology and Academic Libraries: Innovative Services for Research and Learning* (Canuel and Crichton, Editors), *Reading, Research, and Writing: Teaching Information Literacy with Process-Based Research Assignments* (Broussard), *Rewired: Research-Writing Partnerships within the Frameworks* (McClure, Editor), *The Small and Rural Academic Library: Leveraging Resources and Overcoming Limitations* (Kendrick and Tritt, Editors), *Students Lead the Library: The Importance of Student Contributions to the Academic Library* (Arnold-Garza and Tomlinson, Editors).

CLIPP (Formerly ClipNotes)

The popular ClipNotes series, developed by the ClipNotes Committee of the College Library Section (CLS), has undergone a significant change: it will henceforth be known as simply CLIPP (College Library Information on Policies and Procedures). The change is not merely cosmetic; there will be a substantive change to the way content is treated. Essays in CLIPP volumes will be more analytical of best practices while retaining the survey method used in the ClipNotes series. The CLS CLIPP Committee is currently seeking proposals for this new series.

Library Statistics

ACRL's involvement in library statistics goes back to 1906 when James T. Gerould read a paper to the College and Reference Library Section on comparative statistics. Gerould himself started an annual compilation of Statistics for Academic Libraries. Known in the 1920s as "Princeton Statistics," the compilation later became *ARL Statistics*.^[22] In 1941, ACRL began to collect statistics for college and university libraries and continued to do so until the late 1950s when the service was discontinued in order to avoid duplicating the efforts of the National Center for Educational Statistics. In 1979, however, the ACRL University Library Section, citing the need for up-to-date comparative library statistics in a usable format, proposed that ACRL collect comparative statistics for the university libraries not covered by *ARL Statistics*. This led to the publication of *ACRL University Library Statistics 1978–1979* in 1980. Additional statistical studies of university libraries were published in 1983 and 1985. In 1984 and 1985, a special Task Force on Library Statistics worked to define the statistical needs of academic libraries. Its work served

as the basis for the new standing committee on Academic Library Statistics (now known as the ACRL Academic Library Trends and Statistics Editorial Board). This committee recommended expanding the survey universe to include the "ACRL 100 libraries" and also revised the survey form to match that used by the federal government. These survey results were published in 1987. In 1989, the survey returned to the non-ARL university libraries. Also in 1989, ACRL issued a compilation of the data from 1979 to 1989 in machine-readable form. Since 1989, the ARL-like survey was administered and published covering the years 1990–1991, 1992–1993, 1994–1995, and 1996–1997.

In 1998, ACRL published the final edition of *University Library Statistics*, covering 1996–1997, and initiated a new statistics project, *Academic Library Trends and Statistics*. This annual comprehensive data gathering effort includes libraries at all institutions of higher learning in the United States and Canada. Until 2015 the ARL survey instrument was used with permission. A core set of data, intended for comparative analysis over time, consists of four major categories: Collections, Expenditures, Personnel and Public Services, and Networked Resources and Services. Additional questions are used to gather data on a variety of topics of interest to the profession and to identify trends and other changes that are having an impact on library operations. Results, arranged by Carnegie classifications, are published, as well as made available on an annual subscription basis through ACRL Metrics.

In June 2006, based on information provided by the University of Illinois Graduate School of Library and Information Science Library Research Center (LRC) and committee discussion, the ACRL concluded that some libraries are burdened by a subset of the ARL survey questions and the effort necessary to gather data in support of these questions, have resulted in diminishing response rates. Beginning with the 2006 survey, ACRL produced two shortened versions of the existing ARL survey and tailored it to better meet the unique needs of member libraries. The following versions of the existing ARL instrument were offered to ACRL member libraries: ARL survey (existing instrument); four-year college survey (shortened version of existing ARL instrument); community college survey (shortened version of existing ARL instrument). Four-year colleges and community colleges had the option of submitting the complete ARL survey (including supplementary e-metrics questions). Beginning in 2007, 4-yr colleges, community colleges, and non-ARL doctoral libraries had the option of completing the new ARL supplementary statistics in addition to the annual survey. In 2010, ACRL partnered with Counting Opinions to develop a longitudinal database, providing access to annual trends and statistics data collected since 1999. ACRL Metrics was launched in June 2010, and provides

access to ACRL data from 1999–2014 as well as the NCES Academic Library Survey data from 2000–2012. In 2015, ACRL began using the current IPEDS Academic Libraries (AL) component augmented with key questions from the 2012 NCES Academic Library Survey instrument.

Section Newsletters

Most of the 16 ACRL sections publish a semi-annual newsletter. These newsletters provide information about the section's activities. A few sections, such as the Western European Studies Specialists and the Slavic and East European Section (SEES) produce in-depth newsletters. The SEES newsletter, published since 1985, averages 75–80 pages and serves as the official record of the section, reporting on section activities and on relevant activities in the field of Slavic and East European librarianship. Minutes from SEES mid-winter and annual committee meetings are included, along with the minutes of AAASS (American Association for the Advancement of Slavic Studies) Bibliography and Documentation, a reports section, information on new grants and significant acquisitions, new professional appointments, and a bibliography of recent publications. Profiles of special library collections and papers from the annual SEES program are frequently included. The newsletter is distributed internationally and serves as an archival record of Slavic and East European librarianship in North America. In FY2010, sections transitioned from print to electronic only publishing.

ACRL Website

The web provides a powerful opportunity for ACRL units to share information with their membership and with the academic community at large. The URL of the ACRL webpage is <http://www.acrl.org>. The site maintains comprehensive information about ACRL and its programs, including mission and goals, strategic plan, advocacy, information literacy, conferences, institutes, pre-conferences, publications, standards, membership and links to sections and chapters. ALA launched a new information architecture in September 2008. After conducting user studies, ACRL redesigned its website in 2009, using the ALA design as a guide. ACRL Sections and committees are encouraged to mount their pages on the ALA server, but are also free to choose non-ALA servers. In 2011, ALA began using Drupal for its content management system and ACRL's web pages were converted to the new systems. An alternative to ALA Connect where members can work, share documents, vote, and have threaded discussions will be implemented in the fall of 2017. The Web Management Group is also working on

Responsive Redesign of the current website and all associated microsites.

ACRL Insider

In January 2008, ACRL launched a new weblog titled ACRL Insider. Primarily written by staff and ACRL officers, ACRL Insider provides updates on ACRL activities, services, and programs, including publications, events, conferences, and eLearning opportunities. The blog also keeps readers up-to-date on ACRL operations, including updates from members of the Board of Directors. Through ACRL Insider, ACRL fosters openness and transparency by providing an outlet for connection between members and the Board and staff. ACRL Insider complements ACRLog to provide a big picture view of the association. A weekly Member of the Week post spotlights the diversity and accomplishments of the ACRL membership, and is one of the blog's most popular features. ACRL Insider is available online at www.acrl.org/acrlinsider/.

ACRLog

To provide a forum for major issues, the ACRLog, ACRL's issues blog, was launched in October 2005. On an average day, the ACRLog is visited 4000–4500 times and more than 4600 individual posts are read. ACRLog is the work of a team of regular contributors in addition to guest posts featuring a variety of voices, including first-year librarians. ACRLog is available at acrlog.org/.

Keeping Up With...

In April 2013, ACRL launched Keeping Up With... an online current awareness publication featuring concise briefs on trends in academic librarianship and higher education. Each edition focuses on a single issue including an introduction to the topic and summaries of key points, including implications for academic libraries. Keeping Up With... has featured information on digital humanities, flipped classrooms, altmetrics, MOOCs, critical librarianship, competency-based education, net neutrality, and more on the ACRL website at http://www.ala.org/acrl/publications/keeping_up_with.

ACRL Podcasts

ACRL Podcasts have provided fresh dimensions on the issues and events in academic librarianship since January 2007. Podcasts include discussions of ACRL publications, interviews with *C&RL News* article authors, recordings of ACRL Candidate Forums, interviews with ACRL

Conference invited speakers, a series of podcasts on the Value of Academic Libraries initiative, and an interview with filmmaker John Waters at the ACRL Conference in Baltimore. ACRL Podcasts are available on the ACRL Insider blog and through iTunes. In addition, several ACRL groups, most notably the Residency Interest Group, produce podcasts on topics specific to their constituencies.

ACRL Social Media

Over the past several years, the association has been on the cutting edge of new technologies to communicate and connect with members. As of December 2015, ACRL's Facebook page (<http://www.facebook.com/ala.acrl>) boasts 6,429 fans, while 13,692 interested parties receive daily updates on association activities on Twitter (http://www.twitter.com/ala_acrl), and 385 follow the association on Pinterest. These social media tools allow ACRL to create community with members in new and exciting ways.

CONCLUSION

Academic libraries are moving into a century of change that calls for strengthening our collaborations and community relationships if we are to succeed. Through its publications, professional development programs, public policy advocacy, and work with higher education associations, ACRL will continue to enhance the effectiveness of academic and research librarians to advance learning, teaching, and research in higher education. Scholarly communication, student learning, and articulating the value of academic libraries will be of particular concern to the profession and the association in coming years. ACRL initiatives in these areas will help academic librarians learn from one another, become more effective in their work, advance the quality of academic library service, and to promote a better understanding of the role of libraries in academic and research institutions.

ACRL Presidents (beginning with 1938)

1938–1939 Frank K. Walter	1947–1948 William H. Carlson
1939–1940 Phineas L. Windsor	1948–1949 Benjamin E. Powell

ACKNOWLEDGMENTS

The authors wish to acknowledge former ACRL staff whose history of ACRL (Chapter 15 in the *ACRL Guide to Policies and Procedures*) provides the basis for this entry.

Name of the Association

“The ACRL Planning Committee discussed changing the name of the division from the Association of College and Research Libraries to the Association of College and

Research Librarians. The ACRL Planning Committee did not recommend such a change. Since this issue comes up from time to time the Planning Committee set down some of the reasons for the recommendation to provide a record for the future.

1. The term ‘libraries’ is used generically to include librarians and the mission and goals of librarianship. ACRL supports the needs of libraries and their goals through supporting legislation and promoting access to information as well as a wide variety of other ways. These activities relate to libraries more directly than to librarians.
2. The term ‘libraries’ rather than ‘librarians’ includes users and their needs.
3. The time involved in the bureaucracy of changing the name would take away from the business of the association. That time expenditure is not justified since the name change would not affect the direction of the association.
4. There are costs involved in changing the name on printed materials such as stationary and brochures.”

Association of Library Trustees, Advocates, Friends and Foundations (ALTAFF)

Sally Gardner Reed

Association of Library Trustees, Advocates, Friends and Foundations (ALTAFF), Philadelphia, Pennsylvania, U.S.A.

Abstract

The Association of Library Trustees and Advocates (ALTA) was a division of the American Library Association (ALA) and the only division developed for lay supporters and citizens who govern libraries. Founded as the Trustees Section in 1890, this division was one of the oldest units within the ALA. The mission of ALTA was to provide programs and publications designed to help America's library trustees increase their effectiveness both in terms of library governance and, more recently, in terms of library advocacy. On February 1, 2009 Friends of Libraries U.S.A. (FOLUSA), an independent NGO founded to support library friends groups, merged with the ALTA. This merger resulted in an expanded division of ALA that is now called the Association of Library Trustees, Advocates, Friends and Foundations (ALTAFF).

HISTORY

Founded in 1890 as the Trustees Section, this unit was authorized by the Council as the Trustees Division in 1940. In 1951, it merged with the Library Extension Division and the Division of Public Libraries, becoming part of the Public Libraries Division. In 1961, it again became an independent division, the American Library Trustee Association. In 1999, the Association of Library Trustees and Advocates (ALTA) undertook a name change from the American Library Trustee Association to the Association for Library Trustees and Advocates, retaining the acronym ALTA, in order that the American Library Association (ALA) members, other divisions and units of ALA, the profession at large, and the general public will understand the important role of advocacy for libraries that ALTA plays. The ALTA is the only division of the ALA dedicated to providing resources, programs, publications, and services to America's public library trustees and advocates.

MISSION AND RESPONSIBILITIES AND MEMBERSHIP

The mission of ALTA is to support the development of effective library service for all people in all types of communities and in all types of libraries. In the discharge of this mission ALTA assists the efforts of all those who govern libraries, promote libraries, and advocate for libraries.

ALTA has the specific responsibility for:

- Education through a continuing and comprehensive program for Library Trustees to enable them to

discharge their responsibilities in a manner best fitted to benefit the public and the libraries they represent.

- Providing a means for Trustees to have access to information and ideas that will prove useful to them in the governance of their libraries.
- Promoting strong state and regional Trustee organizations.
- Providing to all who value libraries the materials and support they need to be effective advocates for their libraries on the local, state, and national levels.

Membership

With a membership of over 5,000 ALTA represents library trustees and advocates throughout the United States and Canada. Members receive a quarterly newsletter, discounts on publications, reduced conference registration fees, opportunities to network with trustees from across the country, and a subscription to *American Libraries*, the magazine of ALA.

GOVERNANCE AND STRUCTURE

ALTA is governed by a Board of Directors comprising the President, the Vice-President, the Second Vice-President Elect, the immediate Past President, and committee cluster chairs. The work of the organization is done through its committee structure which is, in turn, organized under clusters.

The committee cluster structure and charges are as follows.

Advocacy Committees Cluster

- *Advocacy Committee*—To identify and encourage library advocates; provide information to support library advocacy; to identify, explore, and publicize current and emerging advocacy issues; to provide ongoing education about advocacy issues; and to create strategic alliances with other organizations promoting library advocacy.
- *Awards Committee*—To concentrate on the administration, promotion, and development of awards; to evaluate nominations and select worthy recipients for citations; to evaluate each award every three years; to serve as hosts during the Annual Conference to award recipients who are first-time attendees and/or who are not actively involved in ALTA activities; to approve and recommend to the ALTA Board of Directors all new awards.
- *Intellectual Freedom Committee*—To foster the principles of intellectual freedom among public library trustees; to advise the ALTA Board on matters relating to intellectual freedom; and to serve as liaison to the ALA Intellectual Freedom Round Table, and the ALA Intellectual Freedom Committee.
- *Legislative Committee*—To monitor national legislation for its impact on public library service; to encourage trustee participation in ALA and state legislative activities; to represent the interests of the ALTA division with the ALA Legislation Committee and with other appropriated groups having similar goals.

Business Committees Cluster

- *Development*—To encourage and develop relationships between ALTA and the private sector for the support of ALTA activities and services; to develop a recognition program for those vendors or others who contribute to the ALTA development program; and to develop procedures for working with the ALTA office for coordination of these activities.
- *Leadership Development*—To identify and develop ALTA member leadership; to prepare and present an annual orientation and leadership program for all ALTA volunteers that will provide an essential understanding of the division and its policies and procedures.
- *Membership Committee*—To develop and pursue an aggressive and continuous campaign to recruit and retain members for ALTA from existing and potential member groups such as library trustees, librarians, and friends of libraries.
- *Nominations Committee*—To prepare an ALTA slate of candidate for inclusion in the ALA Election Ballot.

Education Committees Cluster

- *Annual Conference Programs*—To coordinate conference programs sponsored by ALTA at Annual Conferences; to ensure broad coverage; diversity, and limited

duplication of programs; to receive conference program requests and review them for adherence to established procedures and budgets. To encourage the presentation of successful programs; to submit program requests along with the committee's recommendations to the ALTA Board for its action.

- *Regional Programming*—To develop or identify programs or speakers who can present programs around the country on behalf of ALTA; to identify successful local and state program agendas that can be shared with the state representatives and replicated in other areas of the country.
- *President's Events*—To plan the ALTA President's events including the President's Reception at the Midwinter Meeting and the President's Program at the Annual Conference.
- *PLA National Conference*—To work with Public Library Association (PLA)'s national conference committee to develop and identify programs of interest to trustees and advocates for the PLA National Conference.

Publications Committee Cluster

- *Newsletter*—To solicit or write articles for the *VOICE* in conjunction with ALTA and ALA staff.
- *Publication Development*—To initiate and coordinate the publication of books and pamphlets pertinent to the role of public library trustee service; evaluate the need for revision of published materials; to aid in originating new publication, and in defining the purpose, audience, and scope of each publication. To identify existing publications throughout the country that might be brought to ALTA for national exposure and sale.
- *Web Site Development*—To advise office staff on the development of the ALTA Web site and to represent the interests of ALTA to the ALA Web site Advisory Committee; to contribute to the development and management of Web 2.0 technologies including online communities, blogs, wikis, photo-sharing sites, etc.

THE MERGER OF ALTA AND FOLUSA

In 2008, the ALTA Board in conjunction with the Board of Friends of Libraries U.S.A. (FOLUSA) established a joint task force to determine whether and how these two organizations could combine to create a new, larger division for trustees, advocates, friends, and foundation members. FOLUSA was founded in 1989 as an independent NGO whose mission was to support library friends groups and encourage library advocacy.

The ALTA/FOLUSA joint task force developed a new set of bylaws that would effectively combine these organizations into a new, expanded division of ALA. The ALTA

Board unanimously approved sending the new bylaws to ALTA members for their approval in September 2008.

On February 1, 2009 FOLUSA officially merged with ALTA to become the Association of Library Trustees, Advocates, Friends and Foundations (ALTAFF). According to its bylaws, "The purpose of ALTAFF is to support the development of effective library service for all people in all types of communities and in all types of libraries." The new division will have a minimum of four sections: 1) Trustee Section; 2) Friends Section; 3) Foundation Section; and 4) Corporate Friends Section.

The bylaws also define the role of the new division:

<http://www.ala.org/ala/mgrps/divs/alta/Final%20ALTAFF%20Bylaws%20.pdf>.

Article II. Purposes and Responsibilities.

Section 3. ALTAFF has the specific responsibility for:

1. Educating through a continuing and comprehensive program for Library Trustees to enable them to discharge their responsibilities in a manner best fitted to benefit the public and the libraries they represent.
2. Encouraging and assisting the formation of and the development of Friends of Library groups and Library Foundations.
3. Providing a means for Trustees to have access to information and ideas that will prove useful to them in the governance of their libraries.
4. Providing Friends of Library groups and Library Foundations access to information and ideas that will prove useful to them in fundraising, library promotion, and the operation of their organizations.
5. Promoting strong state and regional Trustee and Friends of Library organizations.
6. Providing to all who value libraries the materials and support they need to be effective advocates for their libraries on the local, state, and national levels.
7. Making the public aware of the existence of formalized citizen groups such as Trustees, Friends of Library groups, and Library Foundations, and the services they perform to encourage and develop expanded citizen participation in the support of libraries across the country.

Association of Research Libraries (ARL)

Lee Anne George
Julia Blixrud

Association of Research Libraries, Washington, District of Columbia, U.S.A.

Abstract

The Association of Research Libraries (ARL) is a not-for-profit membership organization comprising over 120 libraries of North American research institutions. ARL influences the changing environment of scholarly communication and the public policies that affect research libraries and the diverse communities they serve. ARL pursues this mission by advancing the goals of its member research libraries, providing leadership in public and information policy to the scholarly and higher education communities, fostering the exchange of ideas and expertise, and shaping a future environment that leverages its interests with those of allied organizations. This account of association priorities and activities updates the entries in the first and second editions of the encyclopedia and focuses on the years 2001–2007.

FOUNDING AND FOUNDATION

For seventy-five years, ARL has addressed issues of concern to the library, research, higher education, and scholarly communities. The Association was established at a meeting in Chicago on December 29, 1932, by the directors of several major university and research libraries who recognized the need for coordinated action and desired a forum to address common problems. Forty-two libraries adopted a constitution that stated, “the object shall be, by cooperative effort, to develop and increase the resources and usefulness of the research collections in American libraries.” On December 5, 1961, the Association was incorporated under the laws of the District of Columbia and certified that “the particular business and objects of the society shall be: Exclusively for literary, educational and scientific purposes by strengthening research libraries.” A grant from the National Science Foundation in 1962 enabled the Association to establish a full-time secretariat in Washington, D.C., with a paid executive director and staff.

In 1987, a series of member discussions led to the construction of a vision statement that portrayed the future aspirations for the Association. Following the statement’s review by the membership and adoption by the Board of Directors, ARL undertook a planning process to develop the Association’s strategy for the 1990s. These efforts culminated in a new mission statement, a values statement, revised programmatic objectives, and a set of financial principles to guide the ARL leadership. In 1988, a new Executive Director was hired and charged with building the Association’s capacity to implement the strategic plan.

ARL’s mission and objectives were reviewed and updated in 1994. The ARL Board annually adopted priorities

to guide the ARL program for the current year and developed a statement of priorities to guide the Association programs for the next 3–5 years. In 2001, the membership undertook a review of core ARL programs. In February 2004, the ARL Board recognized it was time for a comprehensive membership-wide review and assessment of the ARL agenda. This plan was developed by the Strategic Planning Task Force, based on member input and with guidance from the ARL Board.

Guiding Principles

The following principles guided the Task Force in its work. (The “we” in these statements refers to the Association.)

Distinctive mission

- We complement and build on the strengths of other organizations.
- We rethink historic assumptions.
- Our policy positions guide our strategies.

Community

- We are a member-driven organization.
- We are accountable to our members.
- We provide opportunity for full engagement by all member representatives.
- We respect the diversity of our membership.

Intellectual freedom and scholarly communication

- We promote and advocate barrier-free access to research and educational information resources.

Collaboration

- We build relationships with other higher education societies and associations.
- We work closely with other library-related associations, councils, federations, etc.

Diversity

- We encourage and support our members as they strive to reflect society's diversity in their staffing, collections, leadership, and programs.
- We strive to employ a diverse staff.

Operational effectiveness

- We are focused on the needs of our member libraries.
- We allocate our resources wisely and practice sound fiscal management.
- We promote continuing staff development and growth.

The resulting strategic plan identified key priorities for ARL for 2005–2009, areas where the members agreed ARL should play a leadership role at this point in time. The three strategic directions identified in the plan relate to scholarly communication; information and public policy; and research, teaching, and learning. <http://www.arl.org/arl/governance/stratplan.shtml>.

Summary of Strategic Directions (2005–2009)

Strategic Direction I

ARL will be a leader in the development of effective, extensible, sustainable, and economically viable models of scholarly communication that provide barrier-free access to quality information in support of teaching, learning, research, and service to the community.

Strategic Direction II

ARL will influence information and other public policies, both nationally and internationally, that govern the way information is managed and made available.

Strategic Direction III

ARL will promote and facilitate new and expanding roles for ARL libraries to engage in the transformations affecting research and undergraduate and graduate education.

SCHOLARLY COMMUNICATION

ARL members have had a long-standing interest in issues of scholarly communication, initially focusing on the increasing costs of journal subscriptions. In 1989, the membership voted to establish a formal office to address their concerns. The Office of Scientific and Academic Publishing (OSAP) was created in 1990 to understand and influence the forces affecting the production, dissemination, and

use of scientific and technical information. The Office's agenda expanded to address all forms of scholarly information and in 1995 the name was changed to the Office of Scholarly Communication (OSC) to reflect the broadened scope. The OSC promotes Strategic Direction I by working to create new models for scholarly exchange that build on the widespread adoption of digital technologies and networking for research, teaching, and learning; improve the traditional systems of scholarly exchange; and increase the purchasing power of libraries and the terms and conditions under which content is made available. <http://www.arl.org/sc/index.shtml>.

New Publishing Models

ARL has been a leader in advocating the development of innovative systems that offer barrier-free access to research and educational resources. As libraries, research institutions, scholarly societies, commercial publishers, and others experiment with a variety of models to provide digital, online, unfettered access to scholarly information, a number of business models have emerged utilizing different approaches to handling publication costs, managing collections, and providing user access.

In early 2002, an ad hoc task force met to review ARL's strategy for managing intellectual property in the best interests of the academic community and the public. The task force recommended that ARL promote "open access to quality information in support of learning and scholarship." Open access, in this context, refers to works created with no expectation of financial remuneration and available at no cost to the reader on the public Internet for purposes of education and research. The task force developed a 5-year action agenda to promote open access. Activities were identified in seven major areas: education, advocacy, legal, legislative, new funding models, global alliances, and research. The task force also identified essential partners to engage in these efforts, including scholars and scientists, the higher education and library associations, university counsels, scholarly societies, and numerous others.

In February 2002, ARL signed on to the Budapest Open Access Initiative (BOAI), a movement to accelerate progress in the international effort to make research articles in all academic fields available on the public Internet at no cost to the user. Hundreds of individuals and organizations around the world, including scientists and researchers, universities, laboratories, libraries and library organizations, foundations, journals, publishers, and learned societies, have signed the initiative.

ARL published *Open Access Bibliography: Liberating Scholarly Literature with E-Prints and Open Access Journals* in early 2005. This compilation presents over 1300 selected English-language books, conference papers (including some digital video presentations), debates, editorials, e-prints, journal and magazine articles, news articles, technical reports, and other printed and electronic

sources that are useful in understanding the open access movement. It also includes a concise overview of key concepts that are central to the movement. <http://www.escholarlypub.com/oab/oab.htm>.

Since 2002, when DSpace and other institutional repository software began to be available, an increasing number of research libraries and their parent institutions have established institutional repositories to collect and provide access to diverse locally produced digital materials. A 2006 survey of ARL member libraries found that they are rapidly implementing this approach to asset management. Their repositories house a wide range of content, including theses and dissertations, preprints, postprints, and many other formats. <http://www.arl.org/bm~doc/spec292web.pdf>.

In 2006, in concert with other members of the Open Access Working Group, a coalition committed to collective advocacy of open access to research, ARL offered a statement of support in response to the Research Councils U.K. policy that mandated open access in digital repositories for funded works. The statement notes,

We believe that open access research dissemination is an indispensable part of the overall remedy to the serious problems now facing the system of scholarly communication. Moreover, open access is a necessary ingredient in any plan to fully realize the social benefits of scientific advances. While these advantages are important no matter the source of the funding, it is particularly critical when the research is publicly funded and the resulting output is a public good.

<http://www.arl.org/sparc/advocacy/oawg.html>.

A growing number of research libraries have entered into agreements that carry the collections they have built and nurtured beyond their institutions and into the world in digital format. In response to concerns that these agreements, particularly for mass digitization projects, provide responsible management of these collections, ARL engaged a consultant to provide guidance when negotiating such agreements. The consultant identified seven core library interests in evaluating digitization partnerships. He advised that “strategic, community-wide, and societal interests. . . must be an explicit part of the negotiation” and that, as stewards of their collections, libraries should consider carefully issues of exclusivity, uses of the digital files, respect for the public domain and copyright, preservation, use of standards, the quid pro quo, and transparency. Developed at the request of ARL’s Scholarly Communication Steering Committee, a checklist suggested some of the questions negotiators should ask themselves as they define their objectives in entering an agreement. <http://www.arl.org/resources/pubs/br/br250.shtml>.

Scholarly Publishing Market

OSC collects data that provides libraries with information on changes and trends in the market for scholarly

publications. Given the significant and increasing investment research libraries are making in electronic journals, ARL undertook a series of surveys of its members’ electronic journal subscriptions to better understand the issues libraries are facing in ensuring that electronic resources can be used effectively on campus.

ARL developed the first survey in 2002 to gather information about members’ subscriptions, expenditures, and licensing terms for a set of 16 commercial and not-for-profit publishers to determine how many titles libraries were subscribing to from each publisher, what they were spending, and under what pricing model. Another survey sent out in 2003 gathered information on additional issues in licensing, particularly how libraries were thinking about their upcoming negotiations for many of their electronic journal packages. A summary of the results is available at <http://www.arl.org/resources/pubs/br/asit.shtml>.

In 2005, ARL surveyed member libraries on their experiences with large bundled collections of journals to build understanding of the market practices for these bundles. The survey responses provided a broad picture of journal bundling practices and journal collecting as members provided insights into their acquisition rates, satisfaction with pricing terms, the frequency of nondisclosure agreements, contract lengths, cancellation terms, protection of bundled titles in cancellation projects, and other topics.

Information Access Alliance

OSC tracks mergers and acquisitions in the scholarly publishing arena and endeavors to raise awareness of library concerns about the increased consolidation of the publishing industry with antitrust authorities. The Information Access Alliance (IAA), formed by ARL and six other library organizations, advocates a revised analysis of publisher mergers. The IAA urged U.S. Justice Department scrutiny of two mergers of large journal publishers, the Candoover and Cinvens acquisition of Kluwer and Springer and the John Wiley & Sons acquisition of Blackwell Publishing.

In 2005, the IAA and the American Antitrust Institute hosted an invitational symposium on “Antitrust Issues in Scholarly and Legal Publishing.” The meeting presented perspectives from the library community, economists, and antitrust experts in the legal community to an audience of federal and state regulators, economics and antitrust scholars, and librarians. Participants explored issues surrounding consolidation in the scholarly and legal publishing industry and related issues arising from the development of bundling as a pricing strategy.

ARL offered comments on the “Study on the Economic and Technical Evolution of the Scientific Publication Markets in Europe” from the European Commission (the executive branch of the European Union). The study provides a detailed analysis of the journal publishing market and makes a number of policy recommendations

encouraging broader support for public access and open access approaches, regulation of journal bundling, and more vigorous antitrust review of mergers. ARL commented on antitrust and journal bundling issues through the IAA. <http://www.informationaccess.org/>.

Institute on Scholarly Communication

Strategic Direction I also focuses on “the development of library professionals who have the expertise and knowledge to contribute to enhanced and transformed systems of scholarly communication.” To this end, ARL and the Association of College & Research Libraries (ACRL) jointly sponsor the Institute on Scholarly Communication. The institute provides an immersive learning experience to prepare participants as local experts within their libraries and equip them with tools for developing campus outreach strategies. With the number of participants growing, the institute is developing additional resources, such as webcasts and survey instruments, to support library outreach efforts. <http://www.arl.org/sc/institute/index.shtml>.

SPARC

OSC was instrumental in establishing the Scholarly Publishing and Academic Resources Coalition (SPARC), an international alliance of academic and research libraries working to correct imbalances in the scholarly publishing system, in 1998. SPARC has become a catalyst for change. Its pragmatic focus is to stimulate the emergence of new scholarly communication models that expand the dissemination of scholarly research and reduce financial pressures on libraries.

SPARC’s role in stimulating change focuses on educating stakeholders, including authors, publishers, and libraries, about the problems facing scholarly communication and the opportunities for change; advocating policy changes that advance the potential of technology to advance scholarly communication and that explicitly recognize that dissemination is an essential, inseparable component of the research process; and incubating real-world demonstrations of business and publishing models that advance changes benefiting scholarship and academe. SPARC has advanced this agenda by:

- Stimulating the development of increased publishing capacity in the not-for-profit sector and encouraging new players to enter the market;
- Providing help and guidance to scientists and librarians interested in creating change;
- Creating an environment in which editors and editorial board members claim more prominent roles in the business aspects of their journals;
- Demonstrating that new journals can successfully compete for authors and quickly establish quality;

- Effectively driving down the cost of journals; and
- Carrying the methods and message of change to international stakeholders.

In 2007, membership in SPARC numbered nearly 800 institutions in North America, Europe, Japan, China, and Australia. SPARC worked with the Ligue des Bibliothèques Européennes de Recherche (LIBER) and other European organizations to establish SPARC Europe in 2001. SPARC also is affiliated with major library organizations in Australia, Canada, Denmark, New Zealand, the United Kingdom and Ireland, and North America. <http://www.arl.org/sparc/>.

Create Change

Originally designed in 2000, the Create Change Web site has been a significant resource for librarians and faculty members seeking to improve the scholarly communication system. In 2006, ARL and SPARC partnered to update the site to reflect new developments. The redesigned site highlights the perspective of faculty members to provide both an understanding of key issues in scholarly communication and ideas for taking action to promote change. One of the most popular features of the site, the “Cases in Point” section, highlights interviews of faculty members actively working with new scholarly communication models. <http://www.createchange.org/>.

PRESERVATION

The nature of library collections is changing and with change come new challenges for preservation. Paper-based books and manuscripts have been the mainstay of scholarly communications and library collections for hundreds of years. But in less than two decades digital information has become a mainstay of research in all disciplines. Web documents, moving images, sound recordings, and data sets are growing more important and mainstream for scholarship. The continued work of developing preservation strategies in research libraries requires a new level of intensity to succeed in an information landscape that is more complex and less stable than ever.

Recognizing research librarians’ fundamental role and responsibility for preservation, the ARL Committee on the Preservation of Research Library Materials held retreats in 2000 and 2001 to refocus its agenda and develop a new action plan. A statement developed by the committee and approved by the board in 2002 reaffirmed the commitment of ARL members to preserving collections as basic to an understanding of intellectual and cultural heritage through an active stewardship that enables current and future consultation and use of library resources. The statement also acknowledged the difficulties faced by libraries in trying to effectively balance

preservation needs and available resources. http://www.arl.org/preserv/presresources/responsibility_preservation.shtml.

Approximately 150 people attended the 2002 conference "Redefining Preservation, Shaping New Solutions, Forging New Partnerships" that was cosponsored by ARL and the University of Michigan Libraries. Fifteen high-priority actions were identified as needing national attention. Representatives of ARL, the Library of Congress, the Council on Library and Information Resources (CLIR), and the National Endowment for the Humanities subsequently met to review the recommendations and suggest individual and collective strategies for action. The preservation of audio-visual materials was identified as a key area needing attention. As a first step, the Preservation and Conservation Studies program of the School of Information at the University of Texas at Austin, the Library of Congress Preservation Directorate, the National Recording Preservation Board, and ARL cosponsored "Sound Savings: Preserving Audio Collections" in 2003. The program covered topics ranging from assessing the preservation needs of audio collections to creating, preserving, and making publicly available digitally reformatted audio recordings. Conference attendees articulated seven areas for future action to move the field effectively forward. http://www.arl.org/preserv/sound_savings_proceedings/.

In 2004, the ARL Board endorsed digitization as an acceptable preservation reformatting option and released the paper "Recognizing Digitization as a Preservation Reformatting Method" as a first step in building community support and facilitating the development of policies, standards, guidelines, and best practices. CLIR, the Coalition for Networked Information (CNI), OCLC, and RLG joined ARL in supporting digitization as a viable preservation reformatting strategy. http://www.arl.org/bm~doc/digi_preserv.pdf.

In 2005, ARL endorsed the statement "Urgent Action Needed to Preserve Scholarly Electronic Journals." It reflected ARL's recognition that it was a crucial time for the library community to act in support of initiatives that will ensure enduring access to scholarly e-journals. The statement arose out of a meeting of library leaders hosted by The Andrew W. Mellon Foundation and articulated four actions needed to support the development of qualified preservation archives for scholarly e-journals. http://www.arl.org/bm~doc/ejournalpreservation_final.pdf.

During a two-day invitational workshop hosted by the University of North Carolina at Chapel Hill in 2006, 30 leaders in preservation and research libraries discussed the future of preservation programs and activities within research libraries as well as at ARL. Participants included program leaders from organizations active in the preservation realm, including CLIR, CNI, the Library of Congress, The Andrew W. Mellon Foundation, the Preservation and Reformatting Section (PARS) of ALA/ALCTS and RLG-OCLC. Discussion focused on which organizations could

take various roles and what the responsibilities of research libraries are in a new era of preservation needs. Informed by the conversations and ideas generated, the Task Force on the Future of Preservation in ARL Libraries developed recommendations for an action agenda relating to ARL's three strategic program areas. A summary of the recommendations is available at <http://www.arl.org/bm~doc/arlbr251preserv.pdf>.

PUBLIC POLICIES AFFECTING RESEARCH LIBRARIES

It was no accident that the ARL offices were established in Washington, D.C. Research libraries are part of a larger community of higher education and scholarly societies that tended, in the 1960s, to congregate offices in Washington to influence federal policy. Since one of the key roles member libraries look to ARL to perform is to represent their interests before Congress and other federal agencies, the Association has a history of engagement in federal legislation affecting information policies and appropriations. Initially, it was exclusively the role of the executive director to monitor developments and look for occasions when the interests of research libraries should be articulated before the Federal Government. In some years, trying to influence legislation was an all-consuming activity for the Association's executive director and elected officers. By the early 1980s, ARL members concluded that the range of federal relations issues was expanding enough to warrant a dedicated capacity to engage these developments. In 1984, ARL added a federal relations program officer to bring focus to the increasing array of issues. In 1996, the program officer registered as a lobbyist.

A primary goal of Strategic Direction II is to influence legislative action that is favorable to the research library and higher education communities. To achieve this goal, the public policies program helps ARL members keep abreast of the legislative landscape, as well as rapidly changing issues, players, regulations, and community priorities. Program staff track the activities of state and federal legislatures as well as regulatory and government agencies in North America and abroad. Staff analyze, respond to, and seek to influence public initiatives on information, intellectual property, and telecommunications policies. In addition, the program promotes funding for numerous agencies and national institutions and advances ARL members' interests on these issues. The program works with a variety of agencies and offices on public policy issues including the National Science Foundation, United States Geological Survey, Government Printing Office, Office of Science and Technology Policy, Institute of Museum and Library Services, and the Office of Management and Budget, among others. <http://www.arl.org/pp/>.

Copyright and Intellectual Property Policies

Copyright and related intellectual property laws have important and substantial effects on the nature and extent of information services libraries provide to their users. As a key focus for Congress, the courts, and state legislatures became updating copyright and intellectual property laws to meet the challenges of the networked environment, the ARL Board identified intellectual property and copyright as a defining set of issues for the future of scholarly communications. The Digital Millennium Copyright Act, the Sonny Bono Copyright Term Extension Act, peer-to-peer file sharing and digital rights management, and legislation to create additional protections for databases have dominated the public policies agenda. Other areas of concern include orphan works—those works whose owners are difficult or even impossible to locate; Internet neutrality—the concept of keeping the Internet open to all lawful content, information, applications, and equipment; and fair use legislation. <http://www.arl.org/pp/ppcopyright/>.

The public policies program participates in a number of collaborative efforts with a diverse constituency of library, education, legal, scholarly, consumer, and public interest associations; hardware and software manufacturers; and telecommunications providers to advance its agenda and raise library and scholarly community awareness of issues associated with copyright and intellectual property management. Through these partnerships the program has represented ARL interests in a number of *amici curiae* briefs that were filed in copyright and intellectual property court cases. <http://www.arl.org/pp/ppcopyright/copyresources/intlcourt.shtml>.

Changes to copyright laws extend around the globe and the program has a growing emphasis on international copyright treaties. To help address national and international copyright issues, ARL and four other library associations created the Library Copyright Alliance (formerly named the Shared Legal Capability). The purpose of the alliance is to work toward a unified voice and common strategy for the library community in responding to and developing proposals to amend national and international copyright law and policy for the digital environment. Its mission is to foster global access and fair use of information for creativity, research, and education. Intellectual property laws are currently undergoing major changes in response to the growth in the use of digital formats for works. The alliance is principally concerned that these changes do not harm, but rather enhance, the ability of libraries and information professionals to serve the needs of people to access, use, and preserve digital information. <http://www.librarycopyrightalliance.org/>.

To assist member libraries with their copyright education activities, ARL engaged a Visiting Scholar for Campus Copyright and Intellectual Property projects. Working closely with the Public Policies Steering Committee and key ARL and SPARC staff, the visiting scholar leads the

planning and development of a multiphase ARL Copyright Education Initiative to offer information, resources, and tools that are reflective of library principles and goals and are specifically targeted to major campus constituent groups. The Know Your Copy Rights® Web site, which provides resources for librarians working on positive copyright educational programs for academic users of copyrighted materials, was launched in 2007. The site offers a range of tools to help librarians view copyright education from the perspectives of key academic stakeholders. The new resources will help librarians develop messages that are targeted to different campus groups such as faculty, students, legal counsel, academic leadership, and library staff. <http://www.knowyourcopyrights.org/>.

Public Access Policies

The U.S. government funds research with the expectation that new ideas and discoveries from the research will propel science, stimulate the economy, and improve the lives and welfare of Americans. ARL has promoted legislation and selected agency initiatives that would make federally funded research publicly available under certain circumstances. Enhancing access to federally funded research is a priority for the library community as such initiatives improve access by the public, provide for effective archiving strategies for these resources, and ensure accountability of the federal investment. <http://www.arl.org/pp/access/index.shtml>.

ARL has been a strong supporter of the National Institutes of Health (NIH) Public Access Policy. The NIH policy requested that, beginning May 2, 2005, all NIH-funded investigators submit to PubMed Central an electronic version of their final manuscripts upon acceptance for publication in peer-reviewed journals. <http://www.arl.org/pp/access/accessfunded/nihaccess.shtml>.

The Federal Depository Library Program is an important program that enables public access to federal government information. ARL and others in the library community are engaged in reexamining the role of the Federal Depository Library Program in the networked environment. <http://www.arl.org/pp/access/fdlp/index.shtml>.

Privacy, Security, and Civil Liberties

One of the key concerns of the library community has been legislation intended to promote homeland security but that may restrict access to information and have a negative impact on civil liberties. There is a need to balance the interests of public access to information, privacy, and security concerns. The USA Patriot Act and related antiterrorism measures broadened the surveillance capabilities of law enforcement and contained new provisions governing criminal and foreign intelligence investigations. ARL, with others in the library and higher education communities, worked extensively with House and Senate staff

and met with representatives of the FBI, law enforcement, and the Office of Management and Budget to discuss these measures. The program continues to monitor new legislation in this arena.

Cyberinfrastructure

An NSF-funded ARL workshop in 2006 examined the role of research and academic libraries in the stewardship of scientific and engineering digital data. Participants explored issues concerning the need for the new partnerships and collaborations among domain scientists, librarians, and data scientists to better manage digital data collections, necessary infrastructure development to support digital data, and the need for sustainable economic models to support long-term stewardship of scientific and engineering digital data for the nation's cyberinfrastructure. The workshop report reflects the recognition that digital data stewardship is fundamental to the future of scientific and engineering research and the education enterprise and hence to innovation and competitiveness. <http://www.arl.org/bm~doc/digdatartpt.pdf>.

Federal Funding

ARL, with others in the library and education communities, supports the annual appropriations of a number of federal and congressional agencies, national libraries, and agency programs and initiatives. These include the Institute of Museum and Library Services, the Library of Congress, the National Agricultural Library, the National Archives and Records Administration, the National Endowment for the Humanities, the National Science Foundation, and the U.S. Government Printing Office.

RESEARCH, TEACHING, AND LEARNING

The transformation of research libraries mirrors to a large degree the ongoing evolution of research institutions, especially the changes underway in the very processes of research, teaching, and learning. The 2005–2009 strategic planning process identified the need for Strategic Direction III, which focuses on new and expanding roles for ARL libraries to engage in the transformations affecting research and undergraduate and graduate education.

In 2005, the webcast “Teaching, Learning & Research: Libraries and Their Role in the Academic Institution” convened library staff to discuss the role libraries play in academia and highlighted the way one library is moving to more fully engage with faculty and students in this process.

In 2006, the Research Teaching and Learning (RTL) Steering Committee focused on establishing subgroups to pursue ARL's newest strategic direction. The RTL Steering Committee established a Task Force on Library

Roles in Enhanced Environments for Teaching and Learning to advise on a strategic agenda to advance research library roles in teaching and learning. The task force recommended undertaking a broad environmental scan of member activities in support of teaching and learning; securing professional assistance in defining a public relations campaign that addresses the roles research libraries play in the teaching and learning enterprise; strengthening partnerships that leverage common interests, particularly with the EDUCAUSE Learning Initiative and CNI; enabling professional development opportunities for library staff; and identifying best practices for library facilities. The RTL Steering Committee and the Scholarly Communication Steering Committee together established a Joint Task Force on Library Support for E-Science to recommend and initiate strategies to address emerging issues in the role of research libraries in e-science. Other subgroups within Strategic Direction III address special collections and diversity. In 2007, a Program Director for Research, Teaching, and Learning was hired to support these activities.

DIVERSITY INITIATIVES

The need for support in the recruitment and training of librarians, especially minority librarians, was expressed as early as the 1960s and 1970s in funding provisions of the Higher Education Act Title II-B. For many years, ARL worked with members to address their growing concerns about recruiting and retaining a diverse workforce in research libraries. Two grants from the H. W. Wilson Foundation in 1990 and 1991 enabled ARL to establish the project “Meeting the Challenges of a Culturally Diverse Workforce” and hire a part-time Diversity Consultant. Demand for seminars, resource materials, and consulting services on diversity topics continued to grow. By 1993, the ARL membership recognized the need for a full-time program to address minority recruitment and retention. A grant from the Gladys Krieble Delmas Foundation in 1994 assured a stable beginning for the program.

ARL's Diversity Initiatives encapsulate a suite of efforts implemented across the strategic directions that aid the Association in defining and addressing diversity issues in ARL libraries. This program seeks to encourage exploration of the rich gifts and talents that diverse individuals bring to the library. ARL staff work closely with a broad range of libraries, graduate library education programs, and other library associations to promote awareness of career opportunities in research libraries and support the academic success of students from groups currently underrepresented in the profession.

ARL launched the Leadership and Career Development Program (LCDP) in 1997. The 18-month program prepares mid-career librarians from underrepresented racial and ethnic groups to take on increasingly demanding

leadership roles in ARL libraries and addresses the needs of research libraries to develop a more diverse professional workforce that can contribute to library success in serving increasingly diverse scholarly and learning communities. Over the course of four LCDP offerings, 80 librarians completed the program and a large percentage of them have either been promoted within their libraries or have taken new positions with significantly expanded responsibility.

In 2005, ARL conducted an evaluation of the program's effectiveness. The feedback confirmed the continued need for this program and recommended that its instructional design be tied directly to ARL's strategic directions. The goal of the redesigned LCDP is to provide meaningful exposure to and experience with the strategic issues that are shaping the future of research libraries and to prepare professionals of color for increasingly demanding leadership roles in ARL libraries.

The Initiative to Recruit a Diverse Workforce began in 2000 with support from ARL member libraries. The Institute of Museum and Library Services (IMLS) provided additional support in 2003. The program offers a stipend of up to \$10,000 over two years, a mentoring relationship with an experienced librarian, and a leadership training curriculum to MLIS students from underrepresented groups who are interested in careers in research libraries. This multi-year initiative reflects the commitment of ARL members to create a diverse academic and research library community that will better meet the new challenges of global competition and changing demographics. In 2006, the program was awarded a three-year grant through the IMLS Laura Bush 21st Century Librarian Program. These additional funds allow ARL to address the growing need for specialized librarians to help users who create and need access to digital resources and scientific data. The primary goal of the project is to educate, develop, and hire new librarians from underrepresented racial and ethnic groups, especially those with a background in applied and natural sciences and information technology. Forty-five graduate students will receive stipends, mentoring, and leadership development experiences to launch their careers in an ARL library.

The ARL Academy: Careers in Academic and Research Libraries was designed to recruit, educate, and promote visibility within the profession of MLIS students who bring previously gained educational and professional experiences to academic and research libraries. The Academy was a partnership between ARL and three library and information science schools—Catholic University of America, Simmons College, and the University of North Carolina at Chapel Hill. The program was generously supported through an IMLS Recruiting and Education Librarians for the 21st Century grant.

Each fall, from 2004 through 2006, five students from each of the three schools were selected as ARL Academy Fellows. Fellows brought Ph.D.'s or specialized educational

accomplishments to the program. As part of the program, Fellows were immersed through their classes in the core philosophical and theoretical context necessary to successfully contribute within libraries at professional levels. Simultaneously, they gained mentored work experience in an ARL library to significantly increase their exposure, competence, and marketability upon graduation.

LEADERSHIP DEVELOPMENT

For over 30 years, the Office of Leadership and Management Services designed and facilitated effective and well-attended library staff development programs and offered services that helped research libraries serve their clientele through the training and strategic deployment of talented individuals. During the 2004 strategic planning process neither professional development and training nor organizational development emerged as top priority issues for ARL members.
